2. In the evening, or when no danger of robber-bees, exchange the old hive on the stand for a new one. Shake all the bees into the clean hive; the hive to have some strips two inches wide of comb foundation on six or eight frames. I also cage the queen and fasten the cage between the starters. Close the hive and part of the entrance and let them alone four days.
3. After four days exchange these frames and starters for clean frames and sheets of comb foundation. Release the queen and see that they have feed from this time on, either from flowers or being fed healthy feed. Honey from a diseased colony is not safe unless kept boiling and constantly stirred for at least an hour. All combs from such a

[This illustration and article are taken from a circular issued by Inspector N. E. France, for the use of Wisconsin bee-keepers. Editor.]

colony should be burned in a pit on level ground, so that any honey or wax not burned will be melted in the bottom of the pit, to be covered by the earth taken from the pit. Beeswax, honey, or refuse of a solar wax-extractor is not heat enough to kill the germs of foul brood; but beeswax as now made into comb foundation is safe to use. I do not believe in burning property that can be saved, and know, by the experience of many, if these directions are carefully followed, it will cure foul brood.

PICKLED BROOD SYMPTOMS.

Some seasons pickled brood is very bad, and in a few cases I have known it to reduce large colonies to doubtful hopes, but those same colonies after treatment were in a month free from the disease, never showing it since. It may take as careful handling as if foul brood.

The larval bee shows light-brown spots; a little later the capping, of natural color, has a small pin-hole. The bee underneath will be round, having a black, dried, hard, pointed head, often turned up, Chinaman-shoe like. The skin of the bee is quite tough, and, if punctured, the liquid portion underneath will run out, somewhat colored, as thin as water, but never ropy like foul brood. It has little or no smell, does not stick to walls of comb, is easily pulled out, and if the colony is properly cared for in nearly every case the bees soon remove them all.

Never make your bees use old black combs, or combs with dead brood left in them, better make them into wax, and replace with sheets of foundation. If the queen shows feebleness by putting several eggs in one cell, missing others, so that the brood is irregular, I should kill her, and in a week remove all queen-cells from her brood, then introduce a good queen or give a frame of brood with eggs in it from a good colony. Keep all colonies strong.

I do not think the most of pickled brood is owing to the queen, but rather to lack of proper food and heat at stated times. In most cases I find it from a lack of unsealed honey and pollen stored near the young brood. There come times in the spring (between dandelion and white clover bloom) with no honey coming in, and the old bees eat this uncap honey, starving the larval bee at an early age. The result is, it may be pickled brood, and at a date late enough they are gathering honey. If a little careful feeding each day of these shortages is practiced, there will be little or no pickled brood. Rye flour in early spring often will be taken as pollen by the bees, if put out-doors in a warm place. Strong colonies with plenty of good food and young laying queens seldom have any pickled brood.

Honey-Dew a Natural Plant Secretion.

BY C. C. PARSONS.

FROM time to time there appears in the various bee-papers articles on the subject of honey-dew. In nearly every instance what is written is written from the standpoint that it is an animal secretion. I do not know who is responsible for the prevailing idea that that is its chief source—somebody said so a good while ago—some prominent writer wrote it—then, some otherwise well-informed persons accepted it without any investigation, and published it to the world as a fact. So it has found a lodgment in the minds of bee-keepers (or writers on bee-keeping) just as the comb honey "pleasantry" of a few years ago was accepted by the masses of the people. *The one is no more absurd than the other.* If all the "bug-juice" articles that have been written not only by the "small fry," but by those of much knowledge of the bee-keepers' occupation—were printed in a book, and read by all the people, it would do infinitely more to lessen the consumption of honey than did the false statements of the scientist when he said that comb honey could be made by the hand of man. It is no wonder that so many fall into the error when so many of our prominent writers teach, or admit, that it is no error.

Some of the most voluminous advocates of the theory of animal secretion have declared that there is no such thing as "real honey-dew." If there is no such thing as "real honey-dew," there has been much said upon a visionary subject, and all that has been said of it as an animal product has not caused a single person to become a consumer of honey. I do as firmly believe that there is real honey-dew as I believe there is a real Henry Jones. There may not be a Henry Jones in every community.

I saw honey-dew in the days of my childhood, and licked it from the leaves of bushes where it had fallen from its

source above. Since I have kept bees in Alabama, the honey-dew has not failed a single year. It is usually in sufficient quantity to be available as a source of surplus honey. It comes *on time* if it comes at all—just the same as the blooming of the trees and plants. The time is fixed—not on a certain day, but at a time when the vegetation arrives at a certain stage of development. The quantity depends upon the condition of the vegetation at that particular stage, which is determined to a great extent by previous and present meteorological conditions.

What is honey-dew? It is the material food of the plant, digested and taken into the circulation of the plant in greater quantities than is needed by the plant, flowing out thru the vents provided by Nature as safety-valves. So far as I have been able to observe, this substance is essentially the same, whether exuding from the outlets in the flowers, upon the stems, or on the surface of the leaves. It is usually clear as crystal, and that gathered from the leaves does not partake of the flavor and aroma of the plant that produces it, but is sometimes contaminated by coming in contact and being mixt with other substances. Fermentation or decomposition, also, sometimes degenerates it into an unwholesome substance.

The most copious flow of honey-dew I ever saw was in 1897. It was from the pine. In early morning and late in the evening it could be seen dripping from the trees till all the leaves, and even the bare ground beneath them, were covered with the nectar. The bees swarmed over the trees, and the hives were filled as I had never seen them before. The honey was light amber, and of fine flavor, and gave my customers the best satisfaction of any honey I ever produced.

While this honey-flow was on, there was scarcely any honey-dew to be found except from the pine, and every pine was dripping with it—the small as well as the great. Isolated bushes, overshadowed by trees or other growth, that were not producing honey-dew at this time, and those standing in open spaces away from any overhanging trees, gave me a most favorable opportunity to observe the source of this "real honey-dew." 'Tis true, a few insects could be seen with the natural eye, and with a powerful glass many more were seen, but from their diminutive sizes, and insignificant numbers, I would as soon try to believe that the drop of rain water was secreted by the animals it contains, as to try to believe that these insects secreted all this honey-dew.

Prof. Cook expresses astonishment that so great an error should find a place in our dictionaries. If he will carefully read his own evidence in the "Bee-Keepers' Guide," 15th edition, page 335, and compare it with his statement in the American Bee Journal of Jan. 12, 1899, first page, he may be able to give another reason why error sometimes finds its way into good company.

Jefferson Co., Ala.

Value of Sweet Clover for Forage and Honey.

BY H. R. BOARDMAN.

I AM surprised that any bee-keeper of experience, who has had a reasonable opportunity of observing, should report sweet clover anything less than a first-class honey-plant; and yet I am aware that there are a few adverse reports coming from very reliable sources.

I am quite sure—yes, I think I know from my own experience and observations with this plant, extending thru a period of a dozen years or more—that it is unsurpass, and equaled only by the noted alfalfa; and these convictions are supported by the opinions of some of the most practical and reliable bee-men of my acquaintance.

The last season was the first for several years when white clover alone yielded me any surplus, and this, too, with the fields white with its bloom in every direction as far as bees could fly; and yet I should not be warranted in claiming that white clover was not a good honey-plant. It has a world-wide reputation that is unimpeachable. If it were no more abundant than its cousin it would hardly have gained this enviable reputation—certainly not in the last few years.

I think it has been generally conceded by practical bee-keepers that it will not pay to plant for honey alone. This conclusion is undoubtedly a safe one. We must, then, look for some other value besides that of honey, in order to recommend sweet clover as a field crop.

I once supposed, as most people do now, that sweet clover was entirely worthless as a forage-plant for stock—

that nothing would eat it: but I have demonstrated to my own satisfaction that horses, cattle and sheep will not only learn to eat it, but will thrive upon it, both as pasture and dried as hay, and that hogs are fond of it in the green state. I say, they *learn* to eat it, because most stock have to acquire a taste for it, not taking readily to it at first. I gave it a fair trial last summer. My horses and family cow fed upon it almost entirely during the dry part of the season. They became fat and sleek, without the help of grain or other feed. The milk and butter from the cow showed no objectionable flavor. The amount of feed furnished was something surprising. It has a habit of continually throwing out or renewing its foliage and its bloom; also, when cut or fed back, it keeps it constantly fresh. After gaining a growth of four or five feet in height in dense masses in my pasture it was fed down entirely, even the coarse stalks, so that at the close of the season nothing was left. The seeding was, of course, destroyed; but in my desire to put to a severe test the feed value of the crop, this was lost sight of.

Sweet clover, like the alfalfa, sends its great roots deep down into the hardest, driest soils, thus enabling it to withstand severe drouths as no other plant can. This gives it great value as a fertilizer; and growing as it does upon the hardest, poorest soils, it recommends itself for reclaiming soils too poor for raising other crops. It has a habit of taking possession of vacant lots and roadsides, which has caused some alarm with those unacquainted with its habits, fearing it would spread over the fields and prove a pest. I can assure you it will do no such thing. In all of my acquaintance with it I have never seen it spread into cultivated or occupied fields to any extent. I have been very reckless with the seed about my own premises; and if there had been any danger in that direction I should have found it out long ago.

Some time during the latter part of last summer I made a trip thru a part of the State where a severe drouth prevailed. The cattle and sheep looked gaunt and hungry, and were roaming over pastures that were dry, scorched and dead. Fire had run over the farms here and there, adding still further to the look of desolation. In places the cows had been turned into the growing corn, the only green forage in sight. I wondered again and again how it was possible for the stock to escape entire starvation. A field of sweet clover, with its dark green foliage, would have made a refreshing picture amidst this desolation. It would have been more than a picture. It would have supplied a place where it would have been most heartily welcomed and appreciated in this trying emergency. I think it will recommend itself and come to be appreciated soon in times of severe drouth.

It makes a slender growth the first year. It is this crop that is the most valuable for hay, and cutting it will not interfere with the second year's growth. The second year it grows coarser; blossoms, seeds and dies root and branch. If cut for hay in the second year it should be cut just as it is beginning to bloom. A second crop may be cut late in the season. It should be well dried, and it requires good weather to do it in. If cut for seed, it may be thrashed and hulled with a machine, like red clover, or the seed may be sown without hulling.

Now don't be induced by the bright picture I have drawn, to seed your whole farm to sweet clover, for it would result in an unprofitable failure, I am sure. But if you desire to test its value, do it on a small scale, with an acre or two, and do it thoroly. I have found it no easy thing to succeed in making it grow as a field crop, and I would advise sparing no pains in getting it started. When once it gets possession of the ground it will stay, if allowed to ripen a late crop of seed. Sow with winter wheat, or rye in the spring, the same as other clover.—Gleanings in Bee-Culture, Huron Co., Ohio.

A Few Wisconsin Notes and Comments.

BY B. T. DAVENPORT.

HAVING been a reader and lover of the valuable American Bee Journal almost constantly since back in the seventies, I thought it about time for me "to arise" again, like Doolittle's man, and speak.

There is usually about a carload of comb honey produced in this section, but so far there has been but very little gathered this season. Clover bloomed profusely, smelled very sweet, and was covered with bees, but only a very small amount was stored from it.

Basswood bloomed quite well, but yielded no honey; bees worked on it, but not early in the morning as they will when it yields honey well.

If we have favorable weather the rest of the season we expect to get a fair crop of fall honey. My out-apiary, which is about five miles from home, is in reach of considerable buckwheat and any quantity of golden-rod. Those bees are doing better than the ones at home.

QUEEN-MOTHER AND DAUGHTER ON SAME FRAME.

I saw something this summer that I never happened to observe before in my 24 years' experience in keeping bees, and that was an old queen and her devoted daughter, both on the same frame, and the daughter fertile, too.

LEVELING SECTION COMBS.

As it may be a help to some of the novices I will describe my way of leveling combs: If done in warm weather, take a pail of cold water (put in a chunk of ice if you have it), dip the sections in, or better, put one in as you take one out, so the comb will get cold and brittle. Shake most of the water from them when you take them out, then you can scrape them down very rapidly with a knife. Another advantage in doing this is, that should there be any candied honey in the sections the water will soak it up so that if the sections are given to the bees at once they can readily clean it all out. I am seldom able to extract my unfinished sections until winter, thus the candied honey in some of them.

STARTING SWEET CLOVER ON HIGH, SANDY GROUND.

Now I will be very grateful to Dr. Miller, or any other reader of the "Old Reliable" instructor, if he or she can tell me how I can get sweet clover started on a high piece of sandy ground. I have sowed seed on the piece twice, both times in the spring, once with rye and Alsike clover, and the result is only a few scattering patches and stalks, but what there is is very thrifty, standing four to seven feet high.

BASSWOODS DESTROYED BY SUNSCALD AND BORERS.

I have set out from 25 to 50 basswood trees annually for several years; they usually leaf out all right, but I lose a great many during the hot months with sunscald and borers. Perhaps wrapping them with paper or cloth would be an advantage, or even white-washing them; but I would not advise using tarred paper, as that would draw and absorb the sun's rays too much.

Well, I have had to stop twice while writing this short article, and take care of swarms even at this late date Aug. 11.

One inch of rain fell this morning, which was much needed by vegetation. I think it will cause buckwheat to secrete honey faster, as we get but little from it here when very dry. Waushara Co., Wis., Aug. 11.

Introducing Queens—Empty Combs, Etc.

BY EDWIN BEVINS.

AFTER trying many ways of introducing queens, I have settled upon the following as the easiest and safest under ordinary circumstances:

Take a frame of hatching brood (there need not be much of the brood left in the cells) and place it in an empty hive over the queenless bees with a frame the size of the hive, having wire-cloth nailed to both sides of it between the two hives. The thickness of the frame is not of much consequence. I use one about an inch in thickness, and have used others two or three inches thick. I have introduced a number of queens this way without a loss.

WHAT TO DO WITH EMPTY COMBS IN SPRING.

At the close of the last cold spell of weather in April, I found myself in about the same condition "Hoosier" was in as indicated by his question to the senator's answered in the June 8th issue of the American Bee Journal. Like him I had about 200 empty combs, and like him I was intending to work my bees mainly for comb honey. But the possession of these combs changed my plans somewhat. The answers of the senators came too late to be of much benefit to me this season, as I had disposed of a part of the combs and decided on how I would dispose of the rest. But I will here say that I believe they covered the ground more completely and satisfactorily than any other patch of ground has recently been covered by them in the apicultural field.

Mr. Abbott, I think, will take it kindly if I question him a little with reference to his answer. He tells Hoosier to hive swarms on his empty combs. Would Mr. Abbott do this if Hoosier's object was to get all the white honey possible in the surplus cases?

Mr. Hutchinson, in "Advanced Bee-Culture," says he tried hiving swarms on frames of drawn comb, and gave it up because he could get better results from hiving on frames with starters of comb foundation. But conditions have changed since Mr. Hutchinson wrote. The difference between a pound of honey and a pound of granulated sugar has narrowed so much that it is hardly worth while to work for the greatest possible amount of surplus honey at the risk of having to feed a portion of it back to the bees in the shape of granulated sugar.

There is another question: Would Mr. Abbott use these combs from dead colonies to hive swarms on before they had been cleaned up by the bees of other colonies? In my baby days of bee-keeping I used some that had not been cleaned, with disastrous results. But Mr. Abbott, no doubt, considers that a man who has kept bees long enough to have 200 frames of comb from colonies that died in winter knows enough to have them cleaned before hiving swarms on them. You need not say a word, Mr. Abbott: your answer is just as good as that of any of the other senators.

A word as to the way I disposed of my combs: I made beeswax of the crooked ones, and those that were wholly or largely drone-comb. Then I put hives full of the balance over, or under, as many of the strongest colonies in the yard. When the time arrived to put supers on I took them away. If any had brood in them I gave most of it to the colony, leaving enough of the youngest for a nucleus, and either gave the nucleus a queen or allowed it to rear a queen. Some of these nuclei reared fine-looking queens, but doubtless some will say that they will not be so long-lived as queens reared under other conditions.

There were some colonies in the yard too weak to do much in the sections during the white honey-flow, but likely to get strong enough to store some honey later. Over these I put hives full of combs to be left on to the end of the season. Then I will supersede these lazy or failing queens.

Then, I hived swarms on some of the combs as advised by Mr. Abbott and others. All such work will be done by the man who wants increase. The man who wants no increase will find ways enough suggested by the senators to help him out of all embarrassment.

It is a significant fact that eight-tenths of my empty combs are of the size used in the dovetailed hive. My losses in hives taking deeper frames were due to the loss of queens and not to lack of stores. I have bees in some 8-frame hives, 12 inches deep, and these have had no attention from me except to spread the brood in some of them, and put on supers. The hive just mentioned seems to be a better hive to winter bees in than the 10-frame Langstroth. I lost some colonies in these in April.

My opinion of the 8 and 10 frame Langstroth hives for wintering, as expressed in a former article, needs a large revision. Colonies in them which at my second examination I felt sure had honey enough to carry them to fruit-bloom, went down at a fearful rate during that last cold spell in April. If such winters as the last were frequent, I should abandon the use of such hives, or abandon out-door wintering. It cannot be denied that the frames of these hives are of a very convenient size to handle. Feeding sugar syrup to bees is a disagreeable business, but with the Langstroth frame it becomes a necessity. If I continue to use the 8 and 10 frame Langstroth hives I shall think seriously of providing frames of honey to be given the bees when needed. To provide these frames takes from the resources of your own fields. Therefore, it would seem to be the part of wisdom to get them produced in somebody else's field, or, better yet, in some field not yet occupied.

IT WAS A MEANINGLESS QUESTION.

In my article on pages 308 and 309, the types made me ask a meaningless question. I asked, or intended to ask, if it would not be well for those who think they must use hives of standard depth, to make a compromise by using the 10-frame hive, and contract to 8 frames during the honey-flow. I was made to ask them if it would not be well to make a compromise by using the 10-frame hive during the flow. This would be no compromise at all.

THE NECTAR IN THE FLOWER-CUPS.

The theory of Mr. Bates that the better portions of the nectar settle to the bottoms of the flower-cups has received its death-blow, it seems to me, at the hands of Mr. Norton.

I will only add that even if this separation were possible, it would be so slow, and the time for the accumulation of the nectar in sufficient quantity to make a separation possible so short between the visits of the bees that there cannot possibly be a separation that will enable the longer-tongued Italians to store a quality of honey that will be perceptibly better than that of the shorter-tongued blacks.

Mr. Allen, on page 340, says there is no difference between the honey of Italians, blacks, and Carniolans, when capt over before extracting. Has he observed any difference at any time, and under any conditions?

Decatur Co., Iowa.

Selling Honey for Cash or on Commission—How to Avoid Being "Taken In" by Honey-Sharks.

BY ERNEST R. ROOT.

NEARLY every year, or during the latter part of it at least, there are usually quite a number of bee-keepers who complain that they have been unfairly treated by commission houses or honey-buyers. In some cases, at least, the trouble is wholly with the bee-keeper. His honey is improperly put up, breaks down in transit, and in the end the commission man is blamed. There are a few expert bee-keepers who know exactly how to put up their honey, and how to put it on the market without running risks. But there are many more, in spite of all that has been said, who make serious mistakes, greatly to their financial detriment.

In the first place, let me say that there is a vast difference in the *legal responsibility* of an actual *buyer* and a *commission house*. If you ship your honey to an irresponsible purchaser, and he fails to make you returns, you are helpless. If he is worth anything, on the other hand, you can sue him for the full amount of your claim. A commission house, on the other hand, if it takes your honey, takes it in trust. You will be obliged to pay freight, cartage, and assume all risk in shipment. If the honey is broken down in transit, the commission man (if one of the sharpers or skinflint class) may make out its condition a great deal worse than it is, sell it at a certain figure, and represent to you that it sold at a good deal lower figure. He will not only steal the difference between his actual selling price and the price represented to you, but will charge up (which he has a right to do) with freight, drayage, and his 10-per cent commission. Altho you may be pretty well satisfied that he has actually robbed you, unless you can *prove* it you have no recourse in law.

The nicest way to dispose of honey is to sell it for cash to a responsible, honorable firm. In 30 days' time you will get returns for the full amount of your bill. But if the buyer is irresponsible, and especially if he is dishonest, look out. I would rather deal with an irresponsible commission house than with an irresponsible buyer. The former will be compelled to render you *some* sort of returns, while the latter can simply say in effect, "What are you going to do about it?" If you sue him you will be running up attorney fees, without any show of returns; but the commission man *must* render you some sort of statement, and remit according to that statement, or go to jail for having taken your property in trust. He has no right to confiscate it; but, as I stated, he may make a false report, and render you only a small percentage of the actual amount he received for the honey.

In the first place, then, investigate the responsibility of either a commission house or of a buyer, as the case may be.

But suppose you get a good offer, and do not really know the firm, and your banker does not. Or, suppose you haven't time to write, and that, to all appearances, the firm is straight, and you desire to close the deal. Ship the honey to your own name to the point of destination, and attach a draft (your banker can do this for you) to the bill of lading, sending both to some bank at the place where the honey is shipped. This bank will, for a very small fee, collect the money, turn over the bill of lading, and the honey to the actual purchaser.

But suppose there is no bank in your vicinity, and you wish to make yourself safe. Consign your honey as before to your own name at the point of destination, and then request your agent to express (if you mail it, that relieves the express company of all liability) the bill of lading to the agent at the other end of the route. The latter, as agent for the express company, will collect the money, and deliver

the honey and the bill of lading. Money will be forwarded to your agent, when, by paying a small fee, you can take the whole amount of the cash.

Again: Look out for any firm that makes quotations away above the general market figures. These high prices are put out as baits. You ship to the house, and as soon as the honey is in its hands it will report that the "market has suddenly declined," or that your "honey is of poor quality," or that it was "broken in transit," and after a little the house will advise you that the honey was sold for, say, a half what you expected to get for it—may be a good deal less. The concern will be obliged to remit to you according to that report, after deducting freight, drayage and commission. If you expect to get 15 cents for your honey, you will probably get in cash somewhere about 4 or 5. This thing has been done over and over again—so much so that I feel it is necessary to warn our readers thoroly.

Still, again, it is a bad plan to ship to a commission house, even tho it is quoted at thousands of dollars, and its honor is above the average, if such house does not make a *specialty* of handling honey. It cannot begin to do as well for you as some firm that makes honey a business.

HOME-MADE SHIPPING-CASES.

I have several times spoken of the folly of trying to put otherwise nice comb honey into poorly constructed or home-made shipping-cases. I know just how our honey-buyers and commission men regard these poor, miserable, clap-trap affairs made at the "ordinary planing-mills around home." A member of a honey firm in Chicago pointed to me a nice lot of honey put up in home-made cases. Said he, "If it had been put up in no-drip shipping-cases of the modern style, the honey would have brought two cents more per pound." The cases he pointed to me held 24 sections each. This would have made a difference of nearly 50 cents per case, and yet I venture to say the penny-wise-and-pound-foolish bee-keeper thought that, because he was saving one or two cents on the factory-made cases, he was just so much ahead.

Various commission houses in Albany and New York city, Philadelphia and Columbus, emphasized the importance of neat, attractive cases, and in this day of fancy goods and close competition, it would seem as if it should be unnecessary to speak of this.

A PLEA FOR THE COMMISSION MAN.

In the foregoing I may have given the impression that nearly all commission houses are "up to the tricks of the trade;" but that, I am pleased to say, is not the fact. In several cases we have investigated we found the trouble was either due to a lack of experience or because the bee-keeper himself was desirous of getting the "lion's share." The dishonesty is not always on the side of the commission man. The difficulties, when they do come up, however, are mainly those that are the result of inexperience on the part of the bee-keeper, and ignorance of the ordinary methods of doing business—yes, ignorance of the simple principles enunciated above. Gleanings in Bee-Culture.

Paste for Labeling Tin. Put a small quantity of glue broken in small pieces, enough to cover the bottom of a tin vessel with sufficient water to cover it; when the glue has become quite soft fill up to about three inches deep with vinegar; put on the fire to boil, and when all the glue is dissolved add flour until it is thick enough to form a paste—not so stiff as to cut it but so that it will just run. This is said to stick tight to tins, and will not peel off in dry weather. Australian Bee-Keeper.

Feeding Back to Finish up Sections.—F. Greiner talks about it in Gleanings in Bee-Culture. The best time for such work is when it is hot with hot nights. But his time for feeding back comes about Sept. 1. By way of experiment he has built a little bee-house, double-walled and packed, to hold six colonies. A kerosene lamp holds the temperature at 90°, sometimes not being needed in day-time.

Colonies are selected which were working well at the close of harvest. A contracted brood-chamber is used, preferably a half-story hive. Mr. Greiner says:

"Each colony may be given two or three supers of unfinished sections at one time, and a Miller feeder placed on top. This, of course, must be kept filled with diluted honey, which, being kept warm by the heating apparatus, is thus always in good condition to be taken by the bees. Sometimes I feed at the entrance also—not by an entrance-feeder, but by piling up at the entrance sections not containing honey enough to justify me in returning to the hive for finishing. All sealed patches must be unsealed, or scratched with an uncapping-comb, an instrument that might well be offered for sale. When the weather is warm enough all honey will generally be removed from the sections during the night. In cold nights it does not work so well, and the bee-keeper must not fail to remove the sections from the entrance early in the morning, or trouble and robbing may be the result."

Black Drops from the Smoker. F. L. Thompson says in the Progressive Bee-Keeper:

"Some time ago a questioner in the American Bee Journal complained that his smoker dropt inky-looking stuff on his nice white sections when smoking the bees out. Dr. Miller advised him to clean his smoker. I happened to have just cleaned my smoker when I read that, and went out in the yard and smoked a few hives, and that black stuff dript around more copiously than I ever knew it to do before."

Size of Hives. This topic is still to the fore in Gleanings in Bee-Culture. S. A. Niver says that for their buckwheat locality the late Mr. Morton settled upon a 9-frame hive containing 8 frames and a dummy. Mr. Niver wants bees to *swarm*, on this account preferring 8 frames and Carniolans, so that when buckwheat comes there will be plenty of bees instead of having the queen crowded out of the brood-nest by honey stored there earlier. A. N. Draper, working for extracted honey, wants *big* colonies, and if he wants to move an apiary in summer to get an extra flow of honey, it is easier to move a "barn" than two smaller hives. With the barns there is no trouble sorting out frames to extract. The queen need not go out of the brood-chamber to lay, and no frame from the brood-chamber ever goes into the extractor. As a sort of summing up, the editor of Gleanings in Bee-Culture says:

"As the evidence begins to pile in, pro and con, on this subject, it seems light is surely breaking. From all that has been said, if I can interpret correctly from the reports, it would appear that for northern localities the 8-frame capacity is about the right size when running for comb honey; and it does not matter whether that is in the shape of an 8-frame Langstroth or Danzenbaker 10-frame or two Heddon 8-frame brood-chambers, all three being of about the same capacity. For other localities, and particularly in the South, a larger hive seems to be better for the production of extracted honey. Some think a 10-frame Langstroth is quite large enough. Others, like Mr. Draper and the Dadants, believe that a 10-frame Quinby, or what has recently been introduced as the Draper barn, is the thing.

"It was O. O. Poppleton, one of the most careful and conservative bee-keepers there is in the whole land—one who has produced honey in Illinois and Florida both by the ton and by the carload—who says that a comb-honey hive cannot also be a good extracting one, or something to that effect; that the one designed for liquid honey should have a large capacity, and that for comb smaller, so that this question of large and small hives, after all, simmers itself down to a matter of locality and condition of market. If there is more money in producing extracted honey, then it is folly to produce comb; and one should study well his locality, and then decide on the style of hive.

"It is P. H. Elwood who began with the Hetherington-Quinby, 10 of which frames would make a very large hive, and now I believe he uses only five or six such frames in the production of comb honey. These would give an equivalent capacity, if I am not mistaken, of an ordinary 8-frame Langstroth. On the other hand, the Dadants started with a Quinby, pure and simple, and they have been producing extracted honey, and have continued along with the original Quinby, 9 and 10 frames."

The Premiums offered on page 557 are well worth working for. Look at them.

The "Old Reliable" seen through New and Unreliable Glasses.
By "COGITATOR."

APIS MELLIFERA IS HER NAME.

When Ann and Horatio went to be married,
Approaching the altar they luckily tarried—
And some one found out that her name was not right;
'Twas Anna, not Ann, on her baptismal night
Ho's—Anna!

'Specks we also shall have to bosanna the chap who first found out that the honey-bee—her name—is not *Apis mellifica*, but *Apis mellifera*. We've used the wrong name for a good part of a lifetime (without realizing how much we were losing by it), but let's have it right if it takes a leg. Some time about the dawn of the 21st century we'll get to the end of these abominable, and seemingly useless, changes of scientific names. See Editorial Comments, page 456.

MISS PICKARD PERHAPS THE PICK OF THE PILE.

I suspect Miss Pickard is right, that the latter half of this century has seen more development of apiculture than all the centuries gone before. Many daughters have done—apiculturally—but in keeping 111 colonies of bees *at an out-apiary* she rather seems to lead them a lap or two. Page 449.

THE DADANT QUINTET.

And the opening picture, page 465, is one of the very best we have had lately—two men who look as if they were going to smile, and three boys, to whom as yet life is too earnest to smile at. Altho we can't always look very deeply into boys' hearts by looking at their faces, it looks as if the Dadants had lawful rights to a quietly proud smile.

THE DEAD BROOD MYSTERY.

That California dead brood, which isn't foul brood, must be quite a recondite mystery if Prof. Cook, after several years of experience with it, can't tell for sure whether it is starvation or not. I'll say off hand (like other folks who don't know what they're talking about) that it isn't starvation. Short rations help it on, or perhaps hinder the bees from resisting it successfully (same thing in regard to foul brood exactly), but starvation is not going to kill any considerable of brood after they are capt over. Page 450.

Hello! here seems to be the same thing in Minnesota, as told on page 518.

ISLAND-REARED QUEENS AND RATTLESNAKES.

And so Rambler has little inclination toward island-reared queens. Page 451. I merely wonder why they don't come in vogue. Or does in-breeding do more harm than purity can possibly do of good? And Rambler also speaks as if rattlesnakes were unusually plenty this year with him. I wonder if there is such a thing as a general rattlesnake revival. Here for many years there were none. The local wise man said ash leaves kept them away. (Plenty not far distant.) Then again for many years, beginning not far from 1860, rattlesnakes were disagreeably plenty. Then again for a good many years there were few or none. This year we have rattlesnakes again.

GLUCOSE MIXTURE AND POOR HONEY.

From Herman Moore's excellent essay, page 454, I will repeat again this telling sentence: "The sale of a pound of mixture (glucose and something else) has defrauded the honest apiarist out of the market for *ten* pounds of genuine honey." And Tater would add that the apiarist may also commit the same fraud upon himself by selling a pound of honey which, altho genuine, is *poor*.

MY ENEMY, THE HONEY-BARREL.

I must try to be fair with my enemy, the honey-barrel; and if Editor Hill, page 458, has shipt several carloads of honey in cans, and several in barrels, and the cans lost the most by leakage, I'll say it surprises me, and possibly I ought to be more than surprised—reconstructed. However, if the leakage on all the lots was but a trifle, the signifi-

cance of the experience would be small after all. Guess I'll remain among the hostiles, and read that editorial on page 473 some more, until I hear from some other fellow.

ITALIANS STILL "GRIP" THE MAJORITY.

On the question whether to Italianize or not (for honey alone) the 30 senators at present count out: For keeping the blacks, 3; for hybrids, 3; on the fence, 2; for Italianizing, 22. Some of us have been thinking that the Italian was losing its grip, but this doesn't look like it. Page 459.

A CHANCE TO POP INTO POPPY-LORE.

Dr. Peiro's bees are only like everybody else's bees when they revel in the poppies, and seemingly wish they could devour them completely. Page 461. Here's a not-yet-taken chance for somebody to find out something. We don't expect bees to get very enthusiastic about pollen merely; and these don't hold still enough to be after honey; and opium-eaters (at least human opium-eaters) are languid in their manifestations.

ODOR OF NAPHTHALINE FOR FOUL BROOD.

Odor of naphthaline *always present in the hive* for foul brood. Worth thinking of for very badly infected locations. Editor Cowan, page 468. Does not *kill* anything, but prevents development.

A COMMENT ON THE PROGRESSIVE SERMON.

And what shall I say about the progress sermon of L. J. Templin, page 468? Good. But we hear it pretty often, for one thing. Guess it's mostly so, that when a man can no longer progress, nor even cheerfully let other people, it's a good thing for Death to come along. One thing he didn't tell us about is the common and pestilent chap who wants the multiplication-table to progress also—or at least divers other things which have reacht, or nearly reacht, the ultimatum. We are all in danger of forgetting, in this progressive whirl, that there is any such thing as ultimate truth.

PROGRESSING UPSIDE DOWN.

Yes, here it is again: those young Wisconsin bees, page 470, have got the Modern Progress; and so, of course, they must stand t'other end up in the cells from what old-fogy young bees do. If their human prototypes could only get themselves somewhere where they could never gnaw out—it might not be so well with them, but it would be better for the rest of us.

A CASE OF OUTSIDE IN THE INSIDE.

My ears prick up like those of an interested rabbit, at the succulent and queer new idea of setting frames of young brood at the *outside* of the hives. Page 471. Badly taken in. It means outside in the inside, not in back beside the outside.

QUEENS REARED BY A QUEENLESS COLONY.

Dr. Miller's reasoning, quoted page 471, strikes me as very good, and also important. That when a full colony suddenly becomes queenless they will rear a lot of poor queens from too-old larvæ, *but not at first*. Let them sweetly and entirely alone, and they'll come out with a good queen. Poor ones reared later because at that time they have only too-old larvæ, and they have queens "on the brain" too much to stop with the first batch.

And the reproof of Dr. Miller for assuming equal standing with one who had reared queens by the thousand seems to me a little too strong. Mr. Hutchinson says he used the method *a year or two*. Pin that down, and it might be that he reared his first year's queens that way, and a few the second year hardly into the thousands as a beginner in the queen market and the *years* are too few. Bees are versatile creatures, and the conditions under which they work are variable also, and therefore it takes experience spread over many years to be anything like sure on such a question as whether they will start more queen-cells the second, third and fourth days—more than possible that there is both a red side and a blue side to the shield. A queen-breeder is apt to rush the season; a honey-producer is more apt to see bees in entirely normal conditions. Started a little too early, and with colonies not quite strong enough, and what Mr. Hutchinson narrates is not far from what I should expect. I'm not *sure* of my ground, but have a decided impression at least, that in a honey-flow, with the colony uproariously strong, and multitudes of eggs and brood in all stages, they sometimes don't start cells at all for a day or two—instead of all the first day, as Mr. H. gen-

erally saw. In case the first queen goes out with a swarm, it will be another first-day queen just as good that will step into her shoes, I think. Of course, I'm not advising *queen-breeders* to rear their cells any such way.

BEE-SWAX IN A SACK AN "OUGHT-TO-BE."

But you're right, dear prince of York, that beeswax in a sack ought to be as cheaply carried as the same in a box. Page 472. Alas, the calmness of a railway magnate when stung by "ought-to be(s)" is greater than we-uns can attain to under the stings of *Apis* bees! COGITATOR.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Blacks with a Touch of Yellow—Naming Plants.

A correspondent sends some worker-bees, and asks whether they are blacks or what. As they differ in appearance from blacks only in showing a very small touch of yellow, the probability is that they are black with a very little Italian blood.

A plant is also sent upon which bees were working freely. It has peculiar seed-balls, entirely spherical, but I don't know the plant. It isn't the Chapman honey-plant, which also has globular balls, but much larger. Please don't send plants to me for identification, but send them to Prof. C. L. Walton, 2863 N. Ashland Ave., Chicago, Ill., who will then name them in this journal. C. C. MILLER.

Bees Hanging Out—Winter Stores—Queens in Uniting.

1. A cluster forms every eve at the entrance of one of my hives. I have rained water, whipt, scolded, etc., yet they remain there. Is there no danger of their suffocating those inside? If so, what is best to do with them?

2. All the authorities say that for successful wintering of bees, good, pure honey is one of the great essentials. Now, how is a beginner to know good from bad, when all the combs are sealed up in the fall of the year?

3. I have two weak colonies, and wish to unite them. In doing so I desire to keep the best queen, but this is what I don't know, unless it is in the survival of the fittest. My inquiry is this: Is the best queen always the winner in the royal fight? NEW BRUNSWICK.

ANSWERS.—1. If on a hot afternoon you were to come outside the door to sit in a more comfortable place on a shady veranda, and some one should turn the hose on you to drive you in, you wouldn't like it. Very likely the bees don't like the way you treat them when you try to drive them in. Don't you worry about that cluster at the door suffocating the others. They'll manage that all right. If you want to do anything to help them, give more chance for air to get into the hive by way of a larger entrance. If you raise the hive and put under each corner a block half an inch to an inch thick, you will find the cluster at the entrance disappear, not as suddenly as when you rain water on them, but the effect will be more permanent.

2. It isn't always easy to know, but you can make a pretty good guess at it. If, as you say, all stores are sealed up, that's one element strongly in their favor, for thin, watery honey is not the right thing for winter, even if from the best sources. There's no law against your breaking open a few cells and examining the honey. If it's honey that you think you'd like to eat, you may be pretty sure it's all right for the bees. If it's black, disagreeably tasting stuff, it's likely honey-dew, and not all right. But if the beginner is wise, he'll not wait till the winter stores are all sealed, for it will be unwise late in the fall to try to apply

any remedy, but he will know in August or early September the character of the stores for winter. In most localities it is so seldom that winter stores are bad that it may be about as well for the beginner not to trouble his head about it.

3. Generally there will be a survival of the fittest, but not always. When two young queens fight, the contest is one of personal strength. Not so when you unite two colonies with laying queens. In such a case it's more a question of the strength of the two colonies. If you unite with a fairly strong colony having a poor black queen a weak nucleus with a choice Italian queen, you will do well to kill the black queen at least two or three days before uniting, if you don't want the Italian killed. Under ordinary circumstances you may leave the matter to the bees, for the stronger colony is likely to have the better queen; or perhaps it might better be said that the better queen is likely to have the stronger colony.

Sowing Sweet Clover and Cleome.

1. How much sweet clover seed does it take to sow half an acre?

2. How much of the cleome, or rocky mountain bee-plant, does it take to sow half an acre? I have read that it should be sowed in the fall. About what month would be the best?

3. Can I sow the sweet clover along with the cleome? IOWA.

ANSWERS.—1. Perhaps a peck of sweet clover seed would do well for half an acre. A good deal more than that would do no harm, and less might do as well. If sown thin it spreads out, but if sown too thin there is danger that vacancies may be left where seed misses.

2. I don't know about cleome, and, perhaps some one who does know will help out.

Management at Swarming—Field-Peas—Overstocking—Requeening—Water-Melon Juice.

1. What makes the entrance of a hive turn yellow at this time of year?

2. How will it do, in swarming-time, to move the old hive to a new place and set the empty hive on the old stand, where increase and honey are wanted? Will the old colony store enough to winter on?

3. Do bees get honey from stock peas, that is, field-peas? They work heavy on them.

4. There is something over 400 colonies of bees here on four miles square. Is that too many for one locality?

5. Would it be safe to let the bees do their own requeening, or would it be best to do it for them?

6. Will water-melon juice injure bees? Or will it produce honey? TENNESSEE.

ANSWERS.—1. I don't know. I might say it is because the entrance is not large enough, but that would not be fairly answering the question. At certain times, whether it is from the flowers on which they work, or whether the color is produced by themselves, they will give a decidedly yellow color to a piece of clean pine with which they come in contact, especially where they try to get thru a crack, or where the entrance is rather small. If an entrance is abundantly large, you are not so likely to see it made yellow.

2. The plan is all right. The mother colony is likely to have enough for winter, especially as it already had a good store of provisions when it swarmed.

3. I think they do. Either honey or pollen must be got, or they would not work on them. Watch them when at work, and if you find that some of them do not gather pollen you may be sure they are getting honey.

4. That depends upon the location. There may, and there may not, be plenty of pasturage for all. In some places ten times as many bees would be supported on a square mile as in others.

5. Unless a great deal of wisdom is used in the matter it is probably best to leave the matter of requeening to the bees.

6. The juice of melons is not likely to hurt the bees, but I don't know the quality of honey that would be stored from it.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

Place and Date of Next Meeting:

IN FRANKLIN INSTITUTE,
15 South 7th Street, between Market and Chestnut Sts., Philadelphia, Pa.,
September 5, 6 and 7, 1899. Every bee-keeper is invited.

VOL. 39. AUGUST 31, 1899. NO. 35.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Sweet Clover Article, by H. R. Boardman, on another page, will well repay a close reading. From now on until cold weather is perhaps the best of all times to sow sweet clover seed, as the ripe seed that drops from the growing clover in the fall rarely fails to germinate. As we have said before in these columns, had it not been for sweet clover many bee-keepers would have no honey at all in this year of only a partial crop in numerous localities.

The Advice to Honey-Shippers, by Editor Root, on another page, should be read and remembered. If heeded, it may save thousands of dollars to bee-keepers. In the world are many people who are trying to get something for nothing, or get it fraudulently, and it behooves all who have anything to dispose of, to see that they are dealing with honest and upright business firms. There are plenty of the right kind to do all the business that needs to be done.

We endeavor to give annually, in these columns, about the same suggestions as Editor Root has given, but he has done it so fully and so well, that we concluded it would be best to reproduce the principal portion of what he wrote on this important subject.

Honey will be worth money this year, if we may judge from the general poor crop reports that have come in. It is already bringing good prices, and those who have any to sell will be paid well for bee-work this year. By some, who

have had large experience, it is thought that honey prices will not likely go much higher, so if you can get a fair price for your honey now it may be well to dispose of it, rather than risk waiting for higher prices.

After Chicago Adulterated Honey. It will be news to practically all of our readers when we announce that an attempt was made awhile ago to stop the sale of adulterated honey in this city.

The latter part of last April, upon receipt of instructions from the United States Bee-Keepers' Association to go ahead in the honey-adulteration cases, Attorney Herman F. Moore (who was employed by the Association) and the editor of the American Bee Journal proceeded at once to collect samples of suspicious honey for purposes of prosecution. Nine samples were selected from the dozen or more procured, on recommendation of Chemist E. N. Eaton, as being clearly adulterated with glucose.

Out of the nine, five were taken, and a complete chemical analysis made for use in court. Upon the advice of the State's attorney's office, the cases were to be taken before a justice of the peace, and Justice W. T. Hall was selected. Assistant State's Attorney, Fred L. Fake, was detailed to assist Mr. Moore in preparing the evidence and conducting the trials; the intention being to try one case at a time, and follow up with the remaining four if successful in the first.

Acting on the suggestions from the State's attorney's office, criminal proceedings were begun July 1, against Nelson N. Blood, 448 W. Lake St., the complaint being made by the editor of the American Bee Journal, who, accompanied by Mr. Moore, had purchased the alleged honey from Mr. Blood himself.

July 3, Mr. Blood was arrested, and gave bonds in \$200 for his appearance July 10 for trial.

July 10 the case of the People vs. Blood came up for trial, and testimony was given by the writer, Mr. Moore, and Chemist Eaton, for the people, and by Mr. Blood in his own defense. The latter testified that he did not know it was not honey; that he had bought it from Weber Bros. (wholesale grocers), who had sold it to him for honey; that he did not know anything about it.

The case was continued for evidence and argument several times. In the meantime Mr. Moore and the writer called on Weber Bros., and subpoenaed Chas. Weber, after questioning him closely. The subpoena ordered him to produce in court the records, books, papers and bills relating to his last three sales of honey to Mr. Blood previous to June 4, 1899, being the next day after we purchased the jar of so-called honey at Mr. Blood's store. On the further hearing, Mr. Weber testified that he had tasted the stuff, and considered it good honey; that he had purchased it from Randall & Co., a commission firm on South Water street. All of Mr. Weber's testimony indicated that he was working in the interest of his customer (Mr. Blood), so nothing of value was gained from him that would aid us—except, possibly, that we learned who did the adulterating.

July 20, the arguments were completed, and Justice Hall made his decision, discharging the prisoner. This was indeed discouraging to the prosecution, as we all (including the State's attorney) felt that under the law we had clearly earned a favorable judgment, and according to the facts as presented in the case. How Justice Hall could render such a decision, in view of the evidence and the law, was, and is yet, a great surprise to us.

The turning-point possibly was this: The law says, No man shall be punished who shows to the court or jury that he could not with *reasonable diligence* have known that he was violating the law. Mr. Blood did not testify that

he even *tasted* the stuff he sold for honey. He testified to *nothing else* that showed *diligence*, small or great. He showed *no* diligence. The law requires *reasonable diligence*. But Justice Hall seemed not to take any notice of this feature of the law, tho he exprest himself, when invited to taste the stuff bought from Blood for honey, that he had no doubt it was bogus.

Now, while it would appear that the United States Bee-Keepers' Association met with rather a discouraging defeat in its first attempt to enforce an anti-adulteration law, we are not sure but what a good deal was gained for the cause of pure honey in Chicago, after all. Before Justice Hall rendered his final decision, it was noticed that the honey adulterators had wisely taken the hint, and there appeared the additional word "Imitation" on the labels of their mixture of a good deal of glucose with a little honey, thus correctly renaming it "Imitation Honey."

Besides the above advantage gained, we think the adulterators will not find such a great demand for their compound hereafter, as the consuming public were made aware of the prevalence of the bogus article thru the notices in the newspapers of the attempt to enforce the anti-adulteration law of Illinois. For instance, here is what appeared in the Daily News preceding the trial before Justice Hall:

Bee-Keepers Cause an Arrest.

THEY START TO STAMP OUT HONEY MADE OF GLUCOSE.

The efforts of the national, State and local bee-keepers' associations to stamp out the practice of adulterating liquid honey with glucose and other substitutes which are cheaper and more easily secured than the treasured sweetness of the bee, will assume tangible form on Monday, when Nelson N. Blood, a grocer at 448 West Lake street, will be arraigned before Justice Hall, charged with violating the pure-food laws.

Blood's arrest was brought about by Secretary H. F. Moore, of the local association, and ex-President George W. York of the national organization, and the prosecution will be conducted by Assistant State's Attorney F. L. Fake. In the course of an investigation begun last month a small jar of honey was purchast from the grocer, which, upon being analyzed, it is claimed, proved to be 90 percent glucose. At the same time similar purchases were made at other places, and five other prosecutions will be brought on the same charge.

The arrest of the West Side grocer was in line with the present activity of the bee-keepers. It is viewed largely as a test case, and said by them to be important, as one issue that is sure to come up is the question whether Blood knew he was selling an adulterated article. It is not claimed that he did, as his stock was purchast from a jobber, and bore no label of any kind. At any rate, the bee-keepers assert that Blood sold adulterated honey in violation of law, and are going to locate the responsibility. Whether the fight will be waged against the manufacturers and jobbers the bee-officials do not state, but such action is in line with their present activity.

The following was publisht in the Daily News of July 11, the day after the trial began:

Say Bee-Keepers are After Him.

GROCER BLOOD PROSECUTED ON CHARGE OF SELLING BOGUS HONEY.

N. N. Blood, a grocer at 448 West Lake street, was on trial before Justice Hall yesterday, charged with selling an imitation of honey. The complainants were Herman F. Moore and George W. York, representing the organized bee-keepers of America. During the hearing some very peculiar testimony was secured from the grocer and from other witnesses.

The first witness was Mr. York, who is the publisher of the American Bee Journal. His testimony, and also that of Mr. Moore, who is secretary and treasurer of the Chicago Bee-Keepers' Association, told of researches in the line of bogus honey, and especially of the finding of a particular kind of mixture in Blood's store.

E. N. Eaton, an expert chemist, was then called, and testified that the mixture in this jar was 90 percent glucose. After him came Blood, who said he did not know whether it

was pure honey or not. Nicholas Schmitz, a salesman for Weber Bros., from whom Blood bought his honey, said that he was not accustomed to tell his customers whether they were getting honey or not. If they askt him about it he told them he did not know. He did not know whether his house kept pure honey or the adulterated article. After hearing these and other witnesses, Justice Hall continued the case until Friday afternoon.

The Chicago Record for July 15, contained this interesting item on the subject:

Say Honey is Not Genuine.

BEE-KEEPERS CHARGE A GROCER WITH SELLING AN IMITATION PRODUCT.

Justice Hall heard further evidence and a part of the arguments yesterday in the case of N. N. Blood, the grocer at 448 West Lake street, who is charged by officers of the Bee-Keepers' Association with having sold adulterated honey.

Herman F. Moore, secretary of the Association, testified that it was impossible to produce genuine honey at the price paid by Blood for the goods. According to Mr. Moore the grocer should have paid \$1.25 or \$1.30 for a dozen three-quarter pound jars, whereas Blood said that the goods had cost him 90 cents a dozen. Mr. Moore said:

"The retail price set on the honey—10 cents a jar—was less than any bee-keeper can afford to sell it for. If Blood has any knowledge of the grocery business, he ought to know that he could not obtain genuine honey at 90 cents a dozen."

Mr. Weber, a member of the firm of Weber Bros., the wholesale dealers who sold the honey to Blood, testified that the honey was bought as genuine by his house, and that his clerks were not allowed to misrepresent goods to customers. After hearing part of the argument of Attorney Fred L. Fake in behalf of the prosecution, Justice Hall adjourned the case to Tuesday at 3:30 p.m. sharp.

The final notice publisht by the Chicago Record, after Justice Hall rendered his decision, reads as follows:

GROCER BLOOD HELD BLAMELESS.—In the case of the Bee-Keepers' Association against N. N. Blood, a grocer at 448 West Lake street, Justice Hall yesterday held that Blood was not to blame for selling a substance labeled "honey." The justice attributed responsibility to the wholesale grocer from whom the goods were purchast.

A side-light on the subject of food adulteration came out while Mr. Moore and the writer were interviewing Weber Bros. They very kindly read to us an extract from a letter they had just written for the guidance of their salesmen. We were so pleased with the sentiments expressed, that we requested a copy of it, which follows:

CHICAGO, July 10, 1899.

PURE FOODS. We believe the tendency of the buying public in the future will be in the direction of strictly pure foods—and in our opinion the result of this will undoubtedly prove highly beneficial to the health of the consuming public, and unquestionably more satisfactory to the jobber, retailer, and everybody concerned in selling this quality of goods. Adulterated articles in the food line are still on the market. . . . but we believe it will be to the best interests of all concerned to advocate the purchase of pure foods as speedily as possible. Unless you know it to be a positive fact that the article you are selling is absolutely pure, do not sell it as such. If you are in doubt, make it known that way.

WEBER BROS.

It will be noticed that Weber Bros. wrote the above on July 10 *the very day* that their customer (Blood) had his trial for selling adulterated honey. There is no doubt at all, in our mind, that this case had a good influence upon Weber Bros., or they never would have written so strongly in favor of pure foods. Why, *we* couldn't possibly write a stronger paragraph on the subject. And yet, this same firm, a few days before, was selling glucose for honey! *Now* they label it "Imitation Honey."

Where is the bee-keeper who will say that nothing was gained in the interest of pure honey in this attempt to stop its adulteration in Chicago? We contend that the effort was worth all it cost, even if defeat was apparently the re-

sult. What is needed now, is to "move forward" again. It will pay to keep close after the sellers of adulterated honey until they cease entirely to offer the fraudulent stuff. We are in favor of the United States Bee-Keepers' Association continuing the good work; and we believe bee-keepers everywhere will rejoice in the opportunity to contribute their dollars to push this war till every honey adulterator, and also sellers of the mixture, are put where they can't defraud innocent consumers.

The Country's Honey Crop.—An editorial in Gleanings in Bee-Culture for Aug. 15, reads as follows:

"Since our last reports give a little better showing. Indeed, it begins to appear as if there were some bee-keepers, and even some States, where a fair crop of honey has been secured. Missouri, generally speaking, has had a good yield. Wisconsin will have more honey than was at first expected. Northern California has produced quite a showing of honey. Certain portions of Colorado show a good yield; and many places in the South have had fairly good flows of honey. But taking everything into consideration, Northern honey, both comb and extracted, will be a rather scarce article."

It will be seen by referring to the market reports, that prices of honey are stiffening up a little, so that those who have a crop this year will be able to get a fair price for it.

Philadelphia Convention Next Week!

Are you going to be there? The program is a fine one. The railroad rates are right. The Pennsylvania Lines are the ones to patronize if you are anywhere near them. A number of bee-keepers will go on the Pennsylvania road from Chicago, and will get on all along the way from here to Philadelphia. Dr. C. C.

Miller and other prominent Western bee-keepers, with the editor of the American Bee Journal, will leave over this road Monday, Sept. 4, at 3 p.m. We want a large number of bee-keepers to go in that company. It will be a glorious ride all the way, and we can have a continuous, moving convention for 27 hours without a break—except to sleep and rest when tired.

The above train arrives in Philadelphia in time for the very first session of the convention, which is to be held Tuesday evening, at 7:30 o'clock. Don't forget the place of meeting is in Franklin Institute, 15 South 7th St., between Market and Chestnut streets.

And don't forget to go on the Pennsylvania Lines if you want a pleasant and comfortable journey, thru scenery that rivals that of any foreign country. See page 513 of the Bee Journal of Aug. 17 for a few samples.

MR. J. O. GRIMSLEY, of Bee Co., Tex., expects to be at the Philadelphia convention.

HON. GEO. E. HILTON, of Newaygo Co., Mich., wrote us Aug. 21:

"I never saw it so dull. The honey crop for Michigan is practically a failure. It has been one of the most singular seasons I ever saw."

MR. HENRY YEIGH, secretary of the Gould, Shapley & Muir Co., bee-keepers' supply manufacturers, of Ontario,

Canada, called on us, Aug. 22, when on his way home from a six-weeks' tour to the Pacific Coast country. Mr. Yeigh is a very pleasant gentleman to meet. He reports a good season's business at their factory this year.

MR. CHAS. H. THIES, Randolph Co., Ill., with his sister, made us a very pleasant call, Aug. 23. He is one of the many reliable queen-breeders whose advertisements are found in the American Bee Journal, and he deserves all the success with which he is meeting.

MR. A. T. MCKIBBEN, of Morrison Co., Minn., has sent us a series of photographs illustrative of his apiary and some of the implements he uses. The pictures are too dim to engrave well or we might use some of them in the Bee Journal. Mr. McKibben has 195 colonies of bees, but reports "very little honey as yet."

MR. W. H. PUTNAM, president of the Inter-State Mfg. Co., of Wisconsin, dropt in to see us when in Chicago last week on a business trip. Mr. Putnam's factory is in a good lumber district, so they should be able to turn out bee-supplies in a satisfactory manner. Their advertisement is in every issue of the American Bee Journal.

MR. ED GOODRICH, of St. Croix Co., Wis., places this estimate on the American Bee Journal:

"Any man that reads it for one year and doesn't learn something from it, is either too wise for this generation, or too thick-headed to learn. Long may the Bee Journal prosper, and continue to stand in the very front ranks of bee-literature."

MR. D. H. COGGSHALL, of Tompkins Co., N. Y., writing us Aug. 21, said:

"I expect to be at the Philadelphia convention, Sept. 5, 6 and 7. I am getting a good flow of buckwheat honey now. I have seven yards of bees to look after, and it keeps me busy all the time. My hired hand and I took out 2,300 pounds of honey last Saturday afternoon."

MR. BROOKS D. COOK, of Worcester Co., Mass., wrote us Aug. 22:

"I intend to attend the Philadelphia convention of the United States Bee-Keepers' Association, next month. The nice, clear pictures shown on the first page of the 'Old Reliable' last week, make me wish that I was going to travel over the route with you. What time does the convention open?"

"I wish you success in your efforts, and hope to meet you next month."

The convention opens Tuesday evening, Sept. 5, at 7:30 o'clock. We will be pleased to see you, Mr. Brooks, as well as 500 others.

YE EDITOR AND WIFE spent a very pleasant three days (Aug. 15 to 17, inclusive) at Old Salem Chautauqua, Petersburg, Ill. The Assembly is only in its second year, and yet there were present regularly between three and four thousand people. It is located on a lovely spot, where Abraham Lincoln spent his young manhood days. Everything on the place is replete with historic interest, and the program during the session was all that could be desired. It included Hon. James Wilson, Secretary of Agriculture; Hon. W. J. Bryan; Dr. P. S. Henson, of Chicago; Rev. Z. T. Sweeney, of Indiana; Prof. J. G. Camp, of Georgia, and many others, besides splendid musical talent. The assembly was in session from Aug. 11 to 22. It is a fine place to rest, and at the same time be lifted up mentally and morally. Better go next year if you can do so.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Root's Column

Danz. Cartons

We presume you have received a sample, but if not, send a 2-cent stamp for one. These are meeting with considerable favor, and as the price is less than the old, we look for a large sale. We have, in fact, already ordered 100,000 of this style. We are prepared to furnish the following sizes:

- 4 1/4 x 4 1/4 x 2
- 4 1/4 x 4 1/4 x 1 15-16
- 4 1/4 x 4 1/4 x 1 7/8
- 4 1/4 x 4 1/4 x 1 3/4
- or 7-to-foot
- 4 1/4 x 4 1/4 x 1 5/8
- 4 1/4 x 4 1/4 x 1 1/2
- 4 x 5 x 1 5/8
- 3 5/8 x 5 x 1 1/2

PRICES.

If you want your name and address printed on cartons, add to above prices: 30c per 100; 75c per 500; \$1.00 per 1000. For more than 1000, 50c per 1000 after the first thousand.

All Prices *** Withdrawn

BEE-HIVES, SECTIONS SHIPPING-CASES,

And all other Bee-Keepers' Supplies listed in our Catalog.

BOTH WHOLESALE AND RETAIL

Owing to the phenomenal advance in the cost of raw materials ranging from 20 to 100 percent, especially on lumber of all kinds, it is impossible longer to maintain former prices. New price lists are being prepared which we hope to have ready by Oct. 1. The advances will range from twenty to thirty percent. Orders received after Sept. 1 cannot be accepted at old prices. Instead of making gradual advances, keeping pace with the increase in value of the raw materials which has taken place during the past six or eight months, we have maintained former prices until the close of the season. Now we have to make the advance all at once, and on that account it may appear like a large advance; but it is not as great, figured in percents, as the advance in materials has been already, and still higher prices will undoubtedly be reached on lumber during the next six months than those ruling at the present time.

ADDRESS

THE A. I. ROOT CO.
MEDINA, OHIO.

GENERAL ITEMS

Button-Bush or Button-Ball.

I am sending a flower which grows here around the river bank, and would like to know its name, and how good it is for honey.

J. ROORDA.
Jasper Co., Ind.

The plant sent by Mr. Roorda is the common button-bush or button-ball, an excellent illustration of which will be found on page 373 of my "Bee-Keeper's Guide." It grows abundantly on low damp lands in all our Northern States, and, like the linden, which blossoms at the same time, affords a rich harvest-field for the bees, which they are never slow to occupy.—A. J. COOK.

Mason-Bees and Wasp.

EDITOR YORK:—Under another cover I send you a queen cage containing four stingless bees, which I am anxious to know something about, and would highly appreciate any information regarding them. (One you will see is almost jet black in color; two are brown, and the other, longer than the rest, is of a gray color, with yellow legs somewhat resembling a queen.)

I found these strange little creatures some time ago working on the squash and pumpkin flowers in my garden; also a few on the sunflowers. These are the only plants that I have noticed them working on.

If you will notice, you can see that the tongue of these bees is a great deal longer than those of the blacks or Italians, and by drawing it out with a small pair of forceps you can readily see that it is of an enormous length, compared with other bees.

Cullman Co., Ala. ELBERT HAYS.

The insects sent by Mr. Hays are not all bees. Three are bees, one a wasp. The bees are solitary bees, which may be called mason-bees, as they dig in the earth. The wasp is also a digger. All bees feed young on pollen, and have broad, hairy hind legs. The wasps have slim, smooth hind feet. The bees feed pollen which they carry on the legs or hair. The wasps feed their young on insects. There are no stingless bees or wasps in our country, so far as I know, except they be males. I will speak more at length on this subject soon.—A. J. COOK.

"Bee Jones" the Necromancer.

It may be that to an old offender the method employed by H. S. Jones, of this (Cook) county, would be considered matters of every day observation, but to young and succulent tyros in "apilore" his management of bees bordered strongly on the marvelous.

My recent call upon him resulted in much pleasure and instruction. I espied him under the sheltering brim of a big straw hat, which the scorching rays of the sun essayed ineffectually to curl. Squatted before a hive covered over with bees as I never saw before, he there soliloquized in good round English regarding the peculiar

conduct of this particular swarm. I knew by the knitted brows of his gentle countenance that before him was a problem even more abstruse than any Euclid had ever thought of. But nothing daunted, one view was apparently clear to him—to divide that myriad of bees into two hives—a thing he magically proceeded to do in the most nonchalant fashion.

How he dared the peril of that swarming multitude without veil or other protection than his smoker is past my ken, but his means were certainly and speedily effectual.

Not only with his reasonable Italians did he thus dally, but a little later with a neighbor's dark Germans as well. His visit to them was an errand of pillage—the extortion of their coveted supply. Nothing daunted, he blew a volcanic blast into and upon them, then with a trusty old chisel separated the super from the brood-chamber, swept the lingering bees with a whisp of grass, and presto! he had substituted empty sections for the luscious fat ones, and returned to the hive for a fresh refilling.

Now, what manner of man is this, that can breast the ire of the winged "beasties" without flinch or blanching? Or is he, as he really seemed, leagued with the abysmal powers, of reputation old and sulphury? Time was, in good New England, when such an exhibition of witchcraft would have insured the burning stake, the pillory, or ducking pond at least. But 250 pounds of choice white honey, with slashes more in prospect, might incite even a less valiant person to the trial.

He vouchsafed me a suggestion which I surreptitiously repeat for the benefit of the less favored in bee-wisdom—as myself. Following the question of what I would do to make a swarm settle where I wanted it—the idea!—this subtle scion of Eribus, but in this life named Jones, actually confided that if a queen-cell were cut out in May, and the royal jelly contained in it smeared upon a convenient branch or fence, that the truant swarm, smelling this jelly, would alight upon it, or near it, when an empty hive would house them.

Shades of Mephisto! What occultism is this that so deep, dark and mysterious secrets remain yet unexplained? The thought of it maketh the shivers cold my spinal cord, even upon this sultry day!
Cook Co., Ill. EMM DEE.

Motherwort.

I enclose a sample of a plant that I would like to have named. Wm. LYONS,
Sioux Co., Iowa.

The flower from Wm. Lyons, of Iowa, is the common motherwort—one of our most valuable honey-plants. Like almost all the mints, it secretes much nectar. It is illustrated on page 357 of my "Bee-keeper's Guide." A glance at the admirable figure would have shown Mr. L. at once what the plant was. Nearly all our most valuable honey-plants are accurately illustrated in this book.—A. J. COOK.

Can't Complain of Honey Crop.

Our crop of honey is not as large as last year's, but we cannot complain.
E. P. GRIGNON,
Outagamie Co., Wis., Aug. 17.

A Splendid Honey-Flow.

The honey crop in Ontario is on the whole much below the average. The reports received by the Department of Agriculture indicate that the average surplus will not exceed 25 pounds per colony, whilst many will require to be fed for winter.

In this locality and in a few others, the flow was good, in fact with me the best I ever had, averaging fully 120 pounds per colony, spring count, chiefly from basswood. Management had a good deal to do with it, as others in this immediate locality do not speak of an average of over 50 pounds per colony, and some even less.

I wish to say that I am particularly in-

debted to an article in one of the May numbers of the American Bee Journal, from the pen of C. P. Dadant, for my success: in fact, I have found the American Bee Journal a valuable help to me in my apicultural work, and could not now very well dispense with its weekly visits.

Owing to the short crop, honey is in good demand, and bringing better prices than last season.

A. BOOMER.
Ontario, Canada, Aug. 19.

Likely No Honey Shipt.

I do not think there will be any honey shipt from here this season. There is nearly a failure all over southwestern Colorado, and northern New Mexico. We have a fair crop, and I am selling at \$1. and 10 cents for comb, and seven for extracted now, with prospect of a rise.

MRS. A. J. BARBER.
Montezuma Co., Colo., Aug. 11.

A Beginner's Report.

I bought one colony of bees last spring, and they swarmed twice, but they have stored no honey in the sections over the brood-frames yet, but I think they soon will, for the flowers are coming into bloom on the low lands, and wild rice is just coming into flower.

W. A. P. PETERSON.
Goodhue Co., Minn., Aug. 15.

Excellent Honey-Flow.

I have 25 colonies of bees, all in fine condition. The honey-flow in this locality was most excellent. I have taken off half a ton of choice honey (comb and extracted) so far, mostly from white and sweet clover, with prospects good for an abundant fall flow.

I have been reading the valuable American Bee Journal with much interest since I subscribed, last spring. The reports under "General Items," from various States, are especially interesting.

V. H. FISHER.
Grundy Co., Ill., Aug. 21.

Bees Have Done Nothing.

Bees have done nothing here this summer. We may have to feed some as it is too dry, and no nectar in the flowers.

GEORGE K. WHITE.
Ontario, Canada, Aug. 17.

The Spreading Disease.

In regard to what "Minnesota" has to say, on page 518, of the worm found in combs which have this bee-disease resembling foul brood, but which it is not, an acquaintance, in trying to clean combs of this dead brood, found quite a number of these worms, resembling wire-worms. The worms were found in the combs, when taken from the hive, but the dead brood had to be removed in order to find them. The McEvoy treatment for foul brood will not rid colonies of this disease, as we have

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages 16th 1899 Edition 18th Thousand \$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers to the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the TWO NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with \$2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

Bingham Smokers have all the new improvements. Before buying a Smoker or Knife, look up its record and pedigree.

FIFTEEN YEARS FOR A DOLLAR; ONE-HALF CENT FOR A MONTH.

Dear Sir:—Have used the Conqueror 15 years. I was always pleased with its workings, but thinking I would need a new one this summer, I write for a circular. I do not think the 4-inch Smoke Engine too large. Truly, W. H. EAGERTY, Cuba, Kansas. January 27, 1897.

T. F. BINGHAM, Farwell, Michigan.

Bingham & Hetherington Uncapping-Knife.

Carloads of Bee-Hives....

Sections, Shipping-Cases, Comb Foundation

and EVERYTHING used in the bee-industry. We want the name and address of every bee-keeper in America. We supply dealers as well as consumers. We have Dry Kiln, Improved Machinery, 40,000 feet of floor space, and all modern appliances. We make prompt shipment. Write for Catalogs, Quotations, etc. **INTER-STATE MFG. CO., Hudson, St. Croix Co., Wis.**

Please mention Bee Journal when writing.

Page & Lyon Mfg. Co.

NEW LONDON, WIS.,

Operates two Sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of **Bee-Keepers' Supplies....**

They have also one of the **LARGEST FACTORIES** and the latest and most improved machinery for the manufacture of **Bee-Hives, Sections, &c.**, that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the **BEST GOODS AT THE LOWEST PRICES.**

Send for Circular and see the prices on a full line of Supplies.

found by many experiments at different places. This disease is in many places in the East, and I hope to get some information as to the cause and cure, at the Philadelphia convention. **I. J. STRINGHAM.**
New York Co., N. Y.

Crop Almost a Total Failure.

The honey crop is almost a total failure here, but I must have the American Bee Journal, for of course I live in hopes of better times another year. There has been plenty of bloom, such as basswood and clover, but such a dearth of honey, that, like Dr. Peiro, I have been led to enquire, "Why was this thusly?" but that query is still unanswered. **MRS. PAUL BARRETTE.**
Crawford Co., Wis., Aug. 16.

Season a Perfect Failure.

The honey season in this locality has been a perfect failure. There will be no honey for the market from the great honey-belt of York State.

The bees wintered finely, and were in the best condition early in the season to handle a big crop, and the weather was delightful, just wet enough and just dry enough, to all appearance; but that mysterious cause that keeps the honey from flowing was here all thru the season.

Feeding will have to be done largely to winter the bees, unless something unusual happens.

"Bug-juice" is the only thing bee-keepers can look for to help them out, and that is very liable to be a failure, like the clover and basswood.

No one here is afraid of "bug-juice" to winter bees on; the only fear is that the "bugs" won't come; but it is very dry here, and this is the time they put in their appearance, if the weather is right.

IRA BARBER
St. Lawrence Co., N. Y., Aug. 11.

Light White Honey Crop.

The white honey crop here is very light. We may have a full flow, as rains have been abundant lately. **EDWIN BEVINS.**
Deatur Co., Iowa, Aug. 14.

No Surplus Honey Yet.

I can't do without a single number of the American Bee Journal. Bees are beginning to work on fall flowers; no surplus yet this summer. **W. L. MCGHEE.**
Jackson Co., Ohio.

Bees Didn't Do Well.

I like the American Bee Journal ever so much. I had 20 colonies of bees in the spring, increased to 31, and have taken off nearly 600 pounds of honey. Bees are not doing very well around here this year. **MRS. A. C. EASLY.**
Fond du Lac Co., Wis., Aug. 12.

Bees Have Done Well.

Bees have done well enough up to date, and would have done better if those highway bosses had let sweet clover alone. To talk it into them not to do so is a thing utterly impossible. **GUSTAVUS KETTERING.**
Will Co., Ill., Aug. 12.

Honey-Yield Promises Well.

Last winter was a very hard one here in northern Idaho, and most of the fruit was killed, and a good many colonies of bees lost, altho well protected with winter-cases and chaff cushions. I came out in the spring with 25 colonies, which have increased to 58. The spring was cold and backward, but the honey-yield bids fair to be a very good one.

My bees have access to an apple orchard of 25 acres sown to red clover, with about two acres of mignonette near it, and a border of white clover eight feet wide on two sides of it. On many of my hives I have two supers, and expect they will almost all be filled. **J. A. WATKINS.**
Latah Co., Idaho, Aug. 7.

Don't fail to mention the Bee Journal when writing advertisers.

EVERY BEE-KEEPER WILL APPRECIATE THIS.

BIGGLE BOOKS

A Farm Library of unequalled value—Practical, Up-to-date, Concise and Comprehensive—Hand-somely Printed and Beautifully Illustrated.

By JACOB BIGGLE

No. 1—BIGGLE HORSE BOOK

All about Horses—a Common-Sense Treatise, with over 74 illustrations; a standard work. Price, 50 Cents

No. 2—BIGGLE BERRY BOOK

All about growing Small Fruits—read and learn now; contains 43 colored life-like reproductions of all leading varieties and 100 other illustrations. Price, 50 Cents.

No. 3—BIGGLE POULTRY BOOK

All about Poultry; the best Poultry Book in existence; tells everything; with 23 colored life-like reproductions of all the principal breeds; with 103 other illustrations. Price, 50 Cents.

No. 4—BIGGLE COW BOOK

All about Cows and the Dairy Business; having a great sale, contains 8 colored life-like reproductions of each breed, with 132 other illustrations. Price, 50 Cents

No. 5—BIGGLE SWINE BOOK

Just out. All about Hogs—Breeding, Feeding, Butchery, Diseases, etc. Contains over 80 beautiful half-tones and other engravings. Price, 50 Cents.

The **BIGGLE BOOKS** are unique, original, useful—you never saw anything like them—so practical, so sensible. They are having an enormous sale—East, West, North and South. Every one who keeps a Horse, Cow, Hog or Chicken, or grows Small Fruits, ought to send right away for the **BIGGLE BOOKS**. The

FARM JOURNAL

Is your paper, made for you and not a misfit. It is 22 years old, it is the great holed-down hit-the-nail-on-the-head,—quit-after-you-have-said-it, Farm and Household paper in the world—the biggest paper of its size in the United States of America—having over a million and a-half regular readers.

Any ONE of the **BIGGLE BOOKS**, and the **FARM JOURNAL**

5 YEARS (remainder of 1899, 1900, 1901, 1902 and 1903) will be sent by mail to any address for A **DOLLAR BILL**.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Aug. 19.—A few consignments of comb honey received this week, some cases of fancy in plain sections sold at 15 cents, other lots at 13¹/₂ to 14 cents, while No. 1 sold at 12¹/₂ to 13c, amber grades, 10¹/₂ to 11c; dark, 7¹/₂ to 9c. Extracted, white, 7¹/₂ to 8c; amber, 6¹/₂ to 7¹/₂ c; dark, 6c. All selling well. Beeswax, 25¹/₂ to 26c.

R. A. BURNETT & CO.

KANSAS CITY, Aug. 19.—The receipts of honey are light, demand fair. We quote: Fancy white comb, 15c; No. 1, 14c; No. 1 amber, 12¹/₂ to 13c. Extracted, white, 6¹/₂ to 6³/₄ c; amber, 7¹/₂ to 8¹/₄ c; dark, 5¹/₂ to 5³/₄ c. Beeswax, 22¹/₂ to 23c.

C. C. CLEMONS & CO.

NEW YORK, Aug. 22.—Demand good for new crop comb honey, excepting buckwheat. We quote as follows:

Fancy white, 14¹/₂ to 15c; No. 1 white, 12¹/₂ to 13c; fancy amber, 11c; No. 1 amber, 10c. Extracted firm at unchanged prices. Beeswax dull at 25¹/₂ to 26c.

HILDRETH & SEGELER.

SAN FRANCISCO, Aug. 16.—White comb, 11¹/₂ to 12¹/₂ c; amber, 8¹/₂ to 10c. Extracted, white, 7¹/₂ to 7³/₄ c; light amber, 6¹/₂ to 7c. Beeswax, 20¹/₂ to 21c.

The crop has proven exceedingly light. Market is firm at the quotations, the demand for best qualities being greater at existing rates than is the supply.

CLEVELAND, Aug. 18.—New honey scarce and in good demand. Fancy white, 15c; No. 1 white, 13¹/₂ to 14c; fancy amber, 12c; No. 1 amber, 10¹/₂ to 11c.

A. B. WILLIAMS & CO.

BOSTON, Aug. 18.—Fancy white comb, 1-pound sections, 15¹/₂ to 16c; A No. 1, 14c; No. 1, 12¹/₂ to 13c; No. 2, 10c. Light amber extracted, 7c. Beeswax, 27c.

The demand for honey is very light, as is usual this time of year. While stocks are extremely light, the old being practically gone, and no new as yet. Owing to poor crop prospects prices are firm, and it looks as if they would remain so. BLAKE, SCOTT & LEE.

BUFFALO, Aug. 25.—Receipts of fancy new 1-pound combs are very light, selling at 13¹/₂ to 14c; fair to good, 10¹/₂ to 12c; low grades, less. Advise moderate shipments for the present. Some fancy beeswax wanted at 28¹/₂ to 30c.

BATTERSON & CO.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14¹/₂ to 15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7¹/₂ to 7³/₄ c.

PEYCKE BROS.

DETROIT, Aug. 19.—There has been no offerings of new honey and old is fairly well cleaned up. Fancy white we think would bring 14 cents, other grades proportionately cheaper. White extracted, 7¹/₂ to 8c; no dark to quote. Beeswax in good supply at 23¹/₂ to 24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

CONTRIBUTED ARTICLES

Review of the Large-vs.-Small-Hive Discussion.

BY ADRIAN GETAZ.

DURING the past few months quite a discussion on large or small hives has been going on in several of our bee-papers. Probably all that could be said on the subject has been said, perhaps not in every paper but in some one or other. Yet a few points need some explanation.

In the first place, it must be understood that the question is between large or small brood-nests, as it is supposed that all the supers needed to accommodate the honey-flow will be given in either case.

Next, a large brood-nest implies a colony of sufficient size to occupy it. This seems ev-

ident, and should not have to be mentioned, but, nevertheless, I was astonished to see some of our best writers fail to grasp the situation and insist that it was useless to have a large brood-nest which would never be filled. Of course, it is useless to have

Vice-President C. A. Hatch.

President and Director E. Whitcomb.

Secretary Dr. A. B. Mason.

a larger brood-nest than needed, but it is necessary to have it large enough to secure all the brood that can be reared.

How much is necessary? That's the question. All the partisans of small hives say that eight frames are all that an average queen can fill before the honey-flow. After the honey flow has begun, they want the honey to go into the supers instead of being used in the brood-nest. Right here those in favor of large hives say that their queens can fill from ten to twelve or even six-

teen frames, and have a correspondingly large number of field-bees when the flow opens.

Why is it so? We cannot admit that small-brood-nest men (let us call them "small broodists") have inferior queens. Men like Doolittle, Hutchinson, and R. L. Taylor, know what a good queen is, and would have changed their stock long ago if it were so. In fact, Mr. Doolittle's queens, if they had a chance, would fill the biggest brood-nest ever dreamed of by the Dadants.

Perhaps their queens do not fill more than 8-frames because they have only that number. I don't think so. If their queens were able to fill more, they would give more. Men of their experience do not make such a mistake, and in fact they have tried and found 8 to be about the right number.

But the question remains, Why is it that the large broodist's queens can fill 10, 12 and 16 frames instead of only 8?

After reading all that I could find on the subject: after thinking a good deal and comparing their experience with mine, I say, unhesitatingly, that it

is because the small broodist's colonies are too small in the spring, or rather at the end of the winter.

The prolificness of the queen is not the only thing to be considered. No matter how many eggs a queen can lay, no more brood is going to be reared than the bees can take care of. This is especially true in the early part of the season, when the weather is cool yet, and the brood has to be well covered by the bees to get the necessary warmth. No brood will hatch, or rather emerge, until three or four weeks after the opening of the season, and during that period the strength of the colony will decrease all the time. After that, the amount of brood will increase slowly at first, then faster and faster until the honey-flow comes.

Now, it seems evident to me, and my experience has been in accordance with it, that the amount of brood secured at the opening of the honey-flow depends chiefly upon the strength of the colony at the opening of the season. With such colonies as the small broodists have at the opening of the season, only enough brood can be reared to fill the 8 combs by the opening of the honey-flow. With a colony 50 percent stronger in population, 50 percent more brood could be reared—12 combs occupied instead of 8, and with a population 50 percent larger, 50 percent more of surplus could be secured.

It seems to me that I see somebody bobbing up with the question, How do you know that the small broodists winter only small colonies?

Well, I know it by their own writings. It is only two months ago that Mr. Hutchinson said in the *Bee-Keepers' Review* that in Michigan a large colony would be almost sure to rear brood in the winter, and come out practically worthless in the spring. Mr. Doolittle has said, time and again, that small colonies (he calls them medium) winter better than larger ones. Mr. Davenport, in a late number of *Gleanings in Bee-Culture*, wrote that whatever was the strength of the colony in the fall, the spring would find them very nearly alike, and it was therefore useless to winter too large colonies. Mr. Heddon contracts his brood-nest in the summer, and winters only what can occupy one section of his hive. R. L. Taylor also says the small colonies winter the best.

The question is now: Supposing the large colonies could be wintered equally well, which would be the best—80 colonies of 12 combs and population in proportion, or 120 colonies of 8 combs, the total population to be the same in either case?

The difference may depend upon the nature of the honey-flow, and might not be very great; but it would undoubtedly be in favor of the large colonies. There would be only 80 entrances to guard against robbers instead of 120. It would take less bees to keep up the heat necessary for 80 brood-nests than 120 smaller ones, on the same principle that it takes less fencing to enclose one field of two acres than to enclose two fields of one acre each.

When supers are to be put on or taken off, there would be only 80 hives to open and smoke, instead of 120, and therefore a saving of time; and probably less swarming, and less danger of starving in case of a dearth of honey in spring, or inadequate provisions in the winter.

Whether large colo-

nies can be wintered as well as small ones in the North, and in the cellar, I cannot say. In my latitude, wintering outside, the large colonies winter far better than the small ones.

Knox Co., Tenn.

Use of Queen-Excluders.

BY C. P. DADANT.

MR. M. D. ANDES, of Tennessee, wrote me as follows on the subject of queen-excluders:

"I have just read your article on page 482, and I am anxious to know if you use queen-excluders between the supers and the brood-chamber. My 10-frame hives I have been running for comb honey and the 12-frame ones for extracted honey for family use. My experience in working for comb honey agrees with what you say in the article referred to. It requires too much work and too much attention for a person engaged in other business, and I have decided another season to run all my hives for extracting. I find the queen will come up into the extracting-super and will deposit eggs in half or more of the frames, and altho the brood hatches out by the end of the harvest, I find the bees deposit more or less pollen in those combs which the queen has occupied, and it seems to flavor the honey to some extent. Will the use of excluders prevent the bees from depositing pollen in the supers? and is it a great obstruction to the bees in passing up or down?"—M. D. ANDES.

In reply to the first part of the question, I will say that the use of excluders will decidedly prevent the putting of pollen in the supers. First, a bee laden with pollen will often lose her load in passing thru the meshes of the perforated zinc, but what is of more importance is that they have no desire to place their pollen away from the brood. It is well known by all practicing bee-keepers that the pollen is always, or nearly always, placed in the brood-combs or in the outside combs as close to the brood as possible. It is only when the brood extends clear up to the upper edge of the frame that there is any tendency at all to put pollen in the sections immediately above it. A queenless colony, which has no brood to rear, might put pollen almost anywhere about the hive, but such a colony is not in a normal state and not likely to harvest any surplus at all; and if it did, it would only be an exception that would strengthen the rule, since it is commonly agreed that there is no rule without exception. So with excluders, there is but little to fear of pollen out of the brood-combs.

As to the last part of the question, I must say that I am not in favor of queen-excluders, for the very reason that it seems to me that they are a very real hindrance to the free access of bees to the supers. The bees laden with honey cannot but be hampered by these unnatural obstructions, and ventilation is also obstructed. And if we judge from the sales of these excluders when compared with the sale of other bee-appliances, there is but a very small portion of the bee-keeping public who use them at all. Yet, if excluders are properly mounted in a honey-board with a bee-space both above and below, it is quite possible that big crops may be harvested in spite of the hindrance they may cause. They are certainly not as much of a nuisance as the Alley queen-trap or the bee-entrance guards, which are used by some apiarists to prevent swarming. These devices do prevent swarming, and yet I would not use them on my own hives, owing to their being so very much in the way of the worker-bees.

We have tried queen-excluders, but have no use for them in producing extracted honey. We find that with deep-frame hives two inches deeper than the Langstroth—the bees rarely go above to breed. It is only in extraordinary seasons, when the crop is intermittent, altho good, that the queen accidentally finds herself crowded up into the supers. This does not happen with us more than one year in ten, and the possible loss of time caused by the excluders, besides the trouble of putting them on and taking them off,

Director E. R. Root.

Director C. P. Dadant.

would not be repaid by the exclusion of a few combs of pollen or brood.

It may be, however, that not only the shape of the frames, but the location, and the conditions of the honey crop may have something to do with the queen's occupation of the supers, and for that reason we would not entirely deter Mr. A., or any one else, from trying these excluders if they find themselves unable to keep the queen in the lower story; but we would urge them to use them sparingly until they find them of actual benefit, and I believe that the experience of a number of seasons will show that it is only accidentally and rarely that the queen will lay in the super if the lower story furnishes her sufficient breeding-room.

Whatever we do in bee-culture, it is always advisable to look to the comfort of the bees and to try to keep them, as nearly as possible, in a manner to give them the greatest possible ease for the gathering of their crop. We must remember that it takes millions of loads of a single bee to fill a good-sized super, and the results of their industrious toil will be much greater if we make the work easy for them.

Hancock Co., Ill.

Bee-Keeping and Horticulture.

BY HON. GEO. E. HILTON.

The interests of the bee-keeper and the horticulturist are mutual. If we are both successful, we are both enthusiastic. I need not remind any one who plants trees and grows fruits, of the genuine pleasure that thrills the soul when Nature responds to his intelligence, thought, and careful direction. He builds a world in which he himself lives. He desires no other intoxicant to insure his happiness. Horticulture is one of the fine arts, and requires the skill of a master. It is just as impossible for the thoughtless, brainless man or woman to reach the highest round in the ladder in propagating fruit or carrying on a successful apiary, as it is to appreciate success if achieved.

But, after all man's skill in planting, after searching the world over for improved varieties, after propagating, grafting and hybridizing, he must rely mainly upon Nature's methods of fructification. The balmy winds of spring and industrious bees are needed to fertilize the bloom to insure a harvest of fruit. For this purpose, there is no question but that the bee is of great service to the grower of fruits. No other insect appears in such vast numbers at this very important time in the spring when their agency is so much needed to fertilize the orchards and small fruits. If the winds, and other insects aside from the bee, were the only means of carrying the pollen from flower to flower, how often would perfect fertilization fail from too much or too little wind during the brief opportunity when the bursting buds are sighing for the life-giving dust from the neighboring flowers.

Not only has Nature, in her wisdom, provided the tempting honey to entice the bee, but the pollen, so essential to the plant

(and just as essential to the bee in furnishing the proper food for its young), is placed in close proximity to the nectar, so that in getting either, the bee is unwittingly carrying the dust from flower to flower, or working out the wise plans of Providence as relates to plants, and catering to man's taste at the same time.

The Creator did not place the drop of nectar in the flower because it is needed to perfect either the flower or fruit, but for no other purpose than to tempt the bee to brush its hairy legs against the anthers, and carry the golden dust from one

flower to another. So the horticulturist cannot but look upon the bee as his friend, and certainly the horticulturist is a friend to the bee and bee-keeper, and their interests should be mutual.

What, then is there to hinder these two vocations from going hand in hand since each is helpful to the other? They should at least be on the very best of terms, as each furnishes inducements for the other to live and profit thereby.

A great deal has been said about bees injuring fruit - some fruit-growers claiming that bees puncture the ripe grapes, suck the juice and destroy the crop. But from the physical structure of the bee, this is said to be impossible by scientific entomologists. It has no jaws like the hornet; it is made to suck, not to bite, and on close observation, and after repeated experiments, it has been found that where bees are found helping themselves to ripe fruit, the skins had been ruptured by the weather, or over-ripeness, or that hornets, wasps or birds, had first been the infringers. But after the skin has been broken from any cause, if there is a scarcity of honey, the bees, always anxious to be doing something, will endeavor to get their share of the plunder.

Therefore, as regards bees injuring fruit, I, as their attorney, shall claim to the jury that the charge is not proven, and I believe that to-day the more intelligent class of horticulturists agree with me.

I feel I cannot dismiss this subject, which, to the lover of fruits, flowers and bees, is a genuine source of delight, without quoting a few lines from "The Planting of the Apple-Tree," by that venerable sylvan poet, our own Bryant, who saw so much of future hope and promise as he sifted the soft mould about its tiny rootlets:

"What plant we in this apple-tree?
Sweets for a hundred flowery springs
To lead the May Wind's restless wings,
When from the orchard row he pours
Its fragrance at our open doors
A world of blossoms for the bee."

Michigan Farmer.

Bee-Keeping at Experiment Stations and Agricultural Colleges.

BY REV. EMERSON T. ABBOTT.

IT has long been a query in the mind of the writer why more attention is not paid to apiculture by those who are interested in the general advancement of agriculture. Most of our experiment stations and agricultural colleges ignore this industry and utterly fail to recognize the fact that it is one of the most important of the minor industries of the farm. In addition to the regular curriculum most of the agricultural colleges have what they call "short winter courses," during which time instruction is given on the practical side of farm life to those who may desire to attend, but there is seldom anything said about bee-keeping in this course. It is as completely ignored as tho there was no such industry in the land. In our own State (Missouri) only once in a number of years has anyone been employed to represent this industry before the students of the short

Director Dr. C. C. Miller.

Director W. Z. Hutchinson.

Director Emerson T. Abbott.

culture, notwithstanding the fact that there is a large number of bee-keepers in the State who are tax to help advance the interests of other industries. At the present session the legislature will be askt to appropriate \$30,000 to advance the interests of horticulture, but there is no thought of any money being used to promote bee-keeping, notwithstanding the fact that the horticulturist is largely dependent upon the bee-keepers, or at least the bees, for the perfect development of his fruit.

I would suggest to the bee-keepers of this and other States that they now begin to make themselves heard with regard to this matter. Taxation without representation made some serious trouble a long time ago, and we give due notice to the powers that be that it will not be our fault if it does not do the same thing again. We herewith begin a campaign in the interest of the proper recognition of apiculture at every experiment station and in every agricultural college of the land, and we ask all editors who believe that bee-keepers have some rights, to join us in this important work.

There is no rural industry about which people in general have so little practical knowledge, and many, even of the graduates of agricultural colleges, could not even tell a queen from a drone, and most of them are as absolutely ignorant of the interesting and delicate but very important part which the bees play in the production of perfect fruit on vine, tree and shrub, as they would have been if they had been born in the dark ages instead of in the burning light of the 19th century. Selected.

Mating Queens to Selected Drones.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes that he has bought two queens—one from an imported mother and one of the golden variety. Says he is going to rear queens from one and drones from the other, so that he may secure a direct cross. He further states that there are no other bees within nearly two miles of him, and wishes to know if he will not be nearly sure of his object under such conditions. As something similar to this is propounded to me quite often, I will try to give my views thru the columns of the American Bee Journal so as to gain a little rest from answering this same question over and over so many times. And it must be an interesting question to many, else I would not have it askt me so often.

From what I have seen and heard I believe that drones have congregating places where they assemble in great numbers from all over the country for miles around. Such congregating of drones has always been of interest to me, and should be of interest to all those who propose, as does our correspondent, to rear drones from a certain queen, and queens from another; and also to all bee-keepers who have

any ideas regarding the improvement of stock along certain lines.

If drones congregate in certain places, it would be but natural that the queens should be drawn to these places, and the fact that I once observed something which proved to my mind that the queen, at least, was mated at such a congregating place, has led me to believe that nearly all queens meet the drones at such an assembly. And if drones do thus congregate, and the queens go to this congregation, it must be apparent to all, that where there are any bees in the woods, or bees kept by farmers within the flying distance of drones, our queens, reared with so much care, will stand a poor chance of mating one of the desired drones reared from our petted drone-queen, especially as the colonies kept on the let-alone plan will, as a rule, rear 10 times as many drones as will the one we are petting.

Where I witness the mating of a queen was on a high hill when I was cutting weeds out of a cornfield the forepart of August. On every fine afternoon, from one to three o'clock, there was such a humming in the air overhead that it seemed that a swarm of bees must be going over, and at first I lookt for them; but seeing nothing I concluded it was flies of some kind. One very hot day, being tired and warm, I laid down between the rows of corn in the partial shade to rest, and hearing this swarming noise I thought I would see if I could not see something. The shade of the corn helpd me in this, and then I shaded my eyes with my hands and lookt steadily up into the clear sky. After a little I could see thousands of living creatures shooting in all directions, and finally I saw a dozen or so of these shooting objects give chase after another till one overtook it, when the flight was less rapid. The two continued circling around a few seconds, all the while nearing the ground, till they finally stopt on the tassel of a cornstalk near me. I immediately jumpd up, but before I reachd the stalk of corn one of them flew away and the other fell to the ground. I was quite near when the one flew away, and I was quite sure it was a queen-bee; and upon picking up the one that fell to the ground I found it to be a dead drone.

I had now solved the mystery of the humming noise to the satisfaction of my own mind; and when I have since heard this same humming noise, as I very often do, I have believed it to be drones in their congregating places. The fact that this noise is heard only in the early afternoon of pleasant days also proves that drones congregate, for I never heard this noise except at this time of day, the same being just the time the drones are out in full flight. If it was made by the worker-bees it would be heard in the forenoon as well as in the afternoon.

Another item bearing on this subject is the fact, that, prior to the advent of the Italian bee, there was a man who lived near me who had kept black or German bees for nearly half a century, while at this same time another bee-keeper living four miles away procured an Italian queen, when they first came to this country. He purchast this Italian queen in July, and from this one queen stockd his whole apiary of nearly 50 colonies, doing it within 6 weeks, there being no drones reared from any of these Italian queens that

General Manager and Treasurer
Hon. Eugene Secor.

year, nor from their mother. According to Dzierzon, the young queens, as well as the mother would all produce Italian drones. As this man who stocked his apiary with Italian queens took no pains to restrict the rearing of drones, multitudes of such were reared the next season, and, as a result, fully $\frac{1}{3}$ of the queens reared that year by our black-bee bee-keeper gave more or less bees with yellow bands, as I well know, being called in to see them.

I lived nearly five miles from this same Italian bee-keeper, and many of the young queens which I reared proved to have mated with these same Italian drones, from the markings of their workers. This fact has always proven to my mind that drones not only congregate, but that bees must be kept more than five miles apart if we would secure the mating of our queens to the drones which we rear in the colonies set apart for drone-rearing.

From the above it will be seen that I do not take any "stock" in the idea that queens are liable to meet the drones reared for them to so mate, where apiaries are located within two miles of each other. Onondaga Co., N. Y.

Spraying Fruit-Trees—Expert Opinion.

BY PROF. A. J. COOK.

THE following letters were sent me by the editor of the American Bee Journal, with the request that I comply with the desire of Mr. Roe, of Texas:

EDITOR YORK: The enclosed letter I received in reply to a question in regard to bees and pear-blight. I am defending the bees against the efforts of a nurseryman at Alvin, Tex., who recommends spraying pears when in bloom, in order to prevent the spread of blight. Please inquire into this, and publish in the Bee Journal. I would like to know Prof. Cook's opinion. WESTROPP ROE.

MR. WESTROPP ROE, ESQ.

Dear Sir: You can ascertain just what the best information on the blight of pears is by writing to Prof. M. B. Waite, Division of Vegetable Pathology, United States Department of Agriculture, Washington, D. C. He is an extensive pear-grower, and has published the best treatment of anything published on pear-flowers.

It is well established that bees are very instrumental in spreading pear-blight, especially if the trees are blighting while they are blooming. If the blight comes after the trees are thru blooming, then the bee cannot help to spread it. It has been proven that bees visiting the bloom of blighted trees, and going away to those yet healthy, will carry the germs to the healthy orchard. This matter of the agency of bees in the spread of blight is published in a short article in one of the Year Books of the Department, but I am not sure which one.

Trusting that you will get Mr. Waite's bulletin on pear flowers, and get together all the information possible for your own instruction as well as others, I beg to remain,

Very sincerely yours,

FRED W. MALLY,
Entomologist Texas A. and M. College.

I am much interested in the letters from Mr. Roe and Prof. Mally, from Texas, regarding pear-blight, and the influence of bees in spreading it. I am rather surprised that Prof. Mally did not speak with authority against all spraying of fruit-trees with poison while the blossoms are yet on. I am also glad that he referred Mr. Roe to Prof. Waite. There is certainly no better authority in this country than Prof. W. in regard to this matter. It is also a pleasing fact that with all his knowledge he is an ardent friend of the honey-bee, and urges that every fruit-grower sees to it that there are abundant bees in the vicinity of his orchard.

It is true that pear-blight is one of the most serious diseases that the orchardist has to contend with. It is probably true that the disease is conveyed by insects visiting the flowers. This is no more true of bees than of any other insects. The remedy against such disease is the spraying of the trees with the copper salts in some convenient mixture—the Bordeaux mixture being favorite—I think, tho, that none of our best authorities in vegetable pathology recommend the spraying of fruit-trees with this or any other poison while they are in bloom.

In case of treatment with the Bordeaux mixture the spraying is done before the blossoms are opened, and again later in the season. The spraying while yet in bloom is to be strongly objected to because of this evil effect upon the bees, and again because there is no use in doing this. As a remedy against blight, or other microbe diseases which are destroyed by a solution of the copper salts, it should be applied very early, as soon as the buds begin to swell. It is at this time the disease is most susceptible of treatment. Suppose we wait till later, and spray the trees while in bloom, it is probable the treatment is not so effective, and tho it might kill the bees it would not do so immediately, and so would not prevent these insects, or any other nectar-loving species, from visiting other bloom and conveying the germs of this disease. Thus there is no excuse for ever

spraying trees with poisonous compounds while the blossoms are yet on the trees.

Mr. Roe may safely follow Prof. Mally's advice, and get all possible information on this subject.

SPRAYING WITH THE ARSENITES.

While discussing this matter of spraying I wish to express my gratification that all the entomologists have fallen into line and now discourage the use of Paris green or London purple in spraying trees while the blossoms are still hanging. I well remember when I was alone in this position. Years ago I knew of colonies of bees almost depopulated by this arsenic poison. As I have intimated above, the bees were not at once poisoned, and so were able to carry the poison to the hive and store it with the honey. This was fed to the brood, and as a result there was a great mortality among the brood no less than with the mature bees. It is not strange that the bees are not at once killed. The bees do not sip the nectar from the flowers for their own immediate nourishment, but store it in their honey-stomachs to be conveyed to the hive. Thus little if any of this nectar is absorbed into the blood, and so will not poison the bees until fed upon later, after it is digested or changed to honey. It might be argued, with no light force, that trees should never be sprayed with poisons while in bloom, lest persons may be poisoned who may eat the honey. Indeed, I think there would be great danger of this except from the fact that bees gather so little honey from the fruit-bloom that it is rarely stored for sale, and only used by the bees. I am not sure that the bees would get enough of the poison to hurt us, even tho they did store nectar from sprayed blossoms in the hive. I have reason to believe that there would not be enough poison in the nectar of the blossoms to do us any perceptible harm; yet I think all of us would prefer our honey with the Paris green left out.

There is another reason why no one should spray their trees while yet in blossom. Such spraying is usually done for the codling-moth, and we now know that the eggs are not laid on the fruit until the blossoms fall, and do not hatch for some days after this. We also know that the wind will remove the poison, and thus to get the best results from spraying we should not spray until about three weeks after the trees begin to bloom, or until the blossoms have all fallen from the trees.

Prof. Waite has performed a most valuable series of experiments, which show conclusively that we cannot grow either apples or pears with the best success unless we mix many of the varieties, and have the presence of bees to perform the important and often necessary work of cross-pollinization.

There are a few insects—the bud-moths—the larva of which feed upon the buds. In cases where these insects are very numerous it may be very well to spray with the arsenites. And in case of the presence of either the apple or pear blight it may also be well to use the Bordeaux mixture. In this case it is found well to combine the two—the arsenites with the Bordeaux mixture. But here again the spraying should antedate the blossoming season, as the bud-eaters are doing their mischief before the bloom opens.

We see, then, that in all cases spraying should be delayed until after the bloom has fallen from the trees, or else performed before the trees blossom, and never be applied while the bloom is on the trees.

Los Angeles Co., Calif.

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

EDITOR ROOT'S "UNCONSCIOUS BEAUTY."

When that UNCONSCIOUS beauty's found and caught,
Next catch a man who's wise and knows it not;
Then let a saintly priest, that isn't proud,
Send them to nuptial heaven in a cloud.

TIN-PAN MUSIC FOR BEES PRETTY OLD.

That was a bright idea (page 537) which explained the origin of tin-pan music for bees by an act of the British Parliament a thousand years ago. Alas, what a merciless thing truth is, and what a lot of pretty conceits it destroys! It kills off our William Tells, and makes our Pocahontas-es mere young squaws. The trouble here is that the custom of making a racket to settle a swarm is certainly many hundreds of years older than that parliamentary act. Virgil, nearly a thousand years before, speaks of it as well known, and seems to connect it with the events of Jupiter's babyhood—which would be getting back about as far as Adam. This much is the best we can say that the law may have done something to prevent the custom from going out of use.

TWO YEARS TO GERMINATE BASSWOOD SEED.

As to basswood seeds alluded to in the editorial note, page 536, a friend of mine with botany on the brain tells me that basswood is only one of several genera of trees that regularly require two years for the germination of their seeds. Most bee-folks who have planted them gave them up after one year. Two years gives that under-the-snow rascal—the stump-tailed burrowing mouse—extra opportunities to gather them in as winter provender. It is desirable to find some way to get on Nature's blind side, and reduce the germinating period to one year; but may-be we won't succeed. I am trying the trick of picking the seed from the tree a little before it is ripe and planting it then. If I find out anything I'll report.

HOW TO WATER BEES.

If any one has any doubt that apiarists are a versatile and inventive people let him read the answers to Query 99 (page 491) how to water bees. Out of 30 respondents, 7 are together in depending upon natural supply only, and 4 advise wooden floats of some sort; all the rest are as well scattered as the brood of chickens when lightning struck the old hen. Ten of them present special watering devices requiring considerable genius to invent. A. I. Root's familiar old water-fountain is evidently going on the retired list, as it has but two or three followers. What I had previously supposed to be the best was the invention of Dr. Miller—big crock, big coarse cloth over, and chunk of wood not too rotten, but just rotten enough to soak well, and a little smaller than the crock, laid on cloth and prest down in. But I see the Doctor abandons this in favor of a crock stuff with simple stovewood. Perhaps the rotten wood gets corrupt too soon. Perchance all wood and cloth devices may have to go eventually for that and other reasons; and Dr. Mason's crock, with half inch of cappings floating in it, may take the cake. All wooden floats are a weariness to the flesh—they learn to sink so soon.

SOLAR WAX-EXTRACTORS.

Too awfully small for a solar wax-extractor, is a wash-basin (page 490), but the *idea* of a metal solar, of moderate size, plunged in a box of dry sawdust, may be a very valuable idea. For one thing, a single cheap pane of glass will answer. For another thing, the whole affair can be set on a lamp-stove for a few minutes at the close of the day, to make the resultant cake of wax a good one—one of the most difficult points. I am not satisfied with my own solar—too bungling will be more so if I improve it so a lamp-stove *can* be put under the wax. I don't think a double glass pays its keep, except, perhaps, on days when big clouds float in the sky; then the air space holds heat "till the clouds roll by, Jennie." The refuse cakes of a solar can be kept for any length of time, if it is desired to

get a little more wax out of them with heat and press. But no one seems to come forward with a *satisfactory* way of removing the refuse cake of propolis, dirt and waste.

GETTING GRANULATED HONEY OUT OF COMBS.

Mr. John Kedrick's liquid to draw granulated honey out of the combs (page 488)—what is it? Fermenting, half-made honey-vinegar, is it not? And isn't the granulated honey wasted, except as more vinegar material? And couldn't patience mix with pure water be made to do the job? But if the liquid will take out old pollen also, perhaps that may be worth while, sometimes.

EASIER RIPENING OF HONEY IN HEAVY-CROP YEARS.

Honey ripens easier in years when the crop is heavy. Dadant, page 482. Guess that's so—but isn't it about the first time it has got into print?

MRS. BARBER'S BARBAROUS HIVE-COLLECTION.

"All kinds of hives but good ones," eh? The condition of Mrs. Barber's apiary as a bee-feverish beginner. Page 481. Yes, to the callow judgment trifles seem as mountains, and mountains seem as trifles, until we get just such a preposterous collection.

FRANCE'S "TABERNACLE" AND COMB-RACK.

Mr. France's tent (page 497) is a nice one—a regular Tabernacle to go thru the Wilderness with. Reminds me of mine, only mine was much smaller—rotted down with age, having been used comparatively few times in its life. Next I got a folding tent of the Roots—and the mice made it up into nests. You see, when one gets along without a tent as much as he can the remaining cases get fewer and fewer, until when a time he really needs a tent comes he hasn't one in working order. Curiously, bees are much more civilized in their behavior under a tent than outside—but ah, the swelter of it on a hot day!

On the picture of the comb-rack I would say, *When you have room enough* space the combs a little wider than those are spaced.

DADANT'S HONEY-BARREL—NO BACK TALK.

As to Mr. Dadant's article (page 498), I guess I'll introduce the habit of not talking back much to those who reply to afterthoughts—unless there is something that urgently requires more words. Say, if I succeed in that, won't I be a shining example to the brethren?

A CREDITABLE BEE-TREE-HUNTING SYMPOSIUM.

That symposium on bee-tree hunting in summer, page 499, is quite a credit to the paper. Mr. Clark should be satisfied, unless he is a spoilt child of the kind that cries for the moon. To be out 20 times in one July, and find bees ready to meet you every time, is a remarkable experience. Still to say that they will respond in June, July and August "as well as any other months of the year," is going a bit too far. Thanks to Mr. Record for the teaching that oil anise must be kept outside of the box, and used only as a scent. Most of us would have blundered there, if left to ourselves.

PROF. DICKEL VS. DR. DZIERZON.

I guess we owe it to Prof. Dickel to try next season (a good many of us) the two experiments he suggests, and the one outlined by Comrade Theilmann, on page 500. One success on such a line seems to indicate that notwithstanding appearances the queen did lay some drone-eggs in the worker-comb, but many successes would rather prove the contrary, and send the Dzierzon theory to the shop for repairs.

SEX IN BEES AND BEE-WRITERS' CHILDREN.

That lecture of Peter Bois on sex in bees, page 500, almost silences me. Examine the families of bee editors and writers, and see if their children are all females—they receive so few *checks*, you know!

MISS ANNA'S REPORT AND PICTURES.

Compliments to Anna Sundberg, page 505. Her report and series of bee-pictures are extraordinary for a girl of 15. Still, her drone lacks his characteristic bluntness, and her queen lacks the characteristic taper. Makers of advertising cuts oft fail on that difficult taper, and make a wooden spile.

THE KINGBIRD A BEE SQUEEZER AND SUCKER.

The observation on the kingbird—that he usually squeezes and sucks dry a worker-bee while holding it in his

bill instead of swallowing it, seems to reconcile things nicely, and should not be forgotten—unless disproved. Page 505.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Probably Faulty Queens.

I received an Italian queen from a queen-breeder who advertises in the American Bee Journal, about the last of July. She was successfully introduced in about two days. I noticed that she laid four or five eggs in one cell all around the edge of the bottom, but not in the center, some eggs on the side of the cell and some in the center of bottom, and sometimes one egg right on the end of another egg. Where the brood is sealed it shows to be more than half drone-brood, right among the workers in good worker-comb. My neighbor got a queen from the same breeder, at the same time, and his has all drone-brood in the worker-comb. What do you think is the trouble? MICH.

ANSWER.—It is to be feared that the queens are at fault, if you are sure that the queen is present in both cases. Report the circumstances to the breeder, and the probability is that he will replace the queens.

Mixt Bees in a Colony.

I had a colony of bees come to me June 1, being of a different kind of bees from what our general hybrids are. They are smaller and slimmer, with very narrow whitish-looking bands around the body; very gentle, and good workers. About the first of July I gave this and one other colony Italian queens: the one has now nice yellow Italian young bees, and the one I refer to above has young bees a little larger and not so slim as the old, with only two yellow bands. Why are they not all yellow? ILLINOIS.

ANSWER.—The difference in the young bees that emerge three weeks after the introduction of the new queens is caused by the difference in the new queens themselves. If you refer to the young bees emerging before that time, then of course these young queens have nothing to do with that. If the two queens were alike in every respect, then their progeny would be the same, no matter what kind of bees were in the hive at the time of their introduction. The queen that produces workers with only two yellow bands has probably mated impurely.

Directions for Use of Naphthaline and Naphthol Beta.

On page 467, Mr. Cowan, in an article on the treatment of foul brood, says he always has naphthaline in the hive, and that he uses naphthol beta in food for bees.

1. Would there be any evil results from the use of either of these drugs?
2. What quantity of naphthaline should be placed in a hive, and how could it best be kept from the bees?
3. How much naphthol beta should be used per gallon of food?

At present there is no foul brood in my apiary, but there is quite a bit in this neighborhood, so I wish to guard against it as much as possible. ONTARIO.

- ANSWERS.—1. A great many have used them, especially across the ocean, and I've never seen any report of bad results.
2. No special precaution is needed to keep it from the

bees; they'll look out for that part themselves. Mr. Cowan says in the "British Bee-Keepers' Guide-Book:" "Naphthaline in balls is generally used; two of these split in half being the proper dose. The pieces are placed on the floor-board of the hive in the corner farthest from the entrance. The temperature of the hive causes the naphthaline to evaporate, and it must therefore be renewed as required."

3. Mr. Cowan says: "For convenience of measuring, procure from a chemist an 8-ounce bottle, marked with 16 divisions of half an ounce. Thus each division will be equal to one tablespoonful. Put an ounce of naphthol beta into the bottle and half fill with pure methylated spirit. Shake until the crystals are dissolved. Then add spirit till the liquid reaches the fourteenth line on the bottle. The solution is then ready for use. Each division will contain one tablespoonful, which is just the right quantity for 10 pounds of sugar. The solution should be stirred into the syrup while the latter is still hot."

Likely a Laying-Worker.

I hived a small after-swarm in July, which has been building up very slowly. This morning I noticed a number of dead bees in front of the hive, and on examination I found a capt queen-cell on one of the combs which puzzled me, as they must have a queen, as two of the combs had brood and eggs. The capt brood-cells project like drone-cells, but they seem to be all workers. Some of the brood ready to emerge from the cells were dead. The eggs in the cells were laid very irregularly, some cells contained one, two, and some three eggs. What is the matter with them? WIS.

ANSWER. There is a possibility that a drone-laying queen is present, but it is much more likely that you have a case of laying-workers. The bees, you say, are all workers. That's because the brood has not yet begun to hatch. As soon as the young bees begin to come out of their cells, you will find all drones. The best thing you can do is to break up the colony and distribute the bees and combs to other colonies.

Colony With Laying-Workers.

We had a colony that cast a swarm, May 25, 1899, which we hived in a Simplicity hive. About ten days later we looked into the hive and found the colony in first-class condition, with plenty of brood started, and it being just in the middle of the white clover flow we put on an Ideal super at once. About July 25 we took off 13 pounds of honey; the colony was at that time in apparent good condition, but we did not examine the brood-chamber, and yesterday (Aug. 22) we went to the yard to put on supers, when we noticed that this colony had decreased in population, and on examination of the brood-chamber we found the following condition:

Colony queenless, with no eggs, nor larvæ in worker-cells, but an extra amount of drone-comb, and in that we found plenty of eggs and larvæ in all stages, even some already capt, and on that drone-comb were seven queen-cells, two of them already capt, and the others well advanced with larvæ in them. The brood-comb was scatteringly filled with pollen and honey, but no eggs nor larvæ. Please do not overlook the fact that those queen-cells are built over drone-cells only. ILLINOIS.

ANSWER.—You have a plain case of laying-workers. Sometimes it is hard to say whether laying workers make the trouble or a drone-laying queen, but when, as in the present case, eggs and brood are found in drone-cells and none in worker-cells, then you may be sure of laying-workers. The bees seem to know that all is not right, and make desperate efforts to secure a queen by trying to rear one from the only kind of brood they have—drone-brood—but it is all of no avail, and you will find nothing but drone-brood in those queen-cells, which will probably die in the cells. When they are so anxious to have a queen as to try to rear one from drone-brood, one would think they would be glad to accept any queen offered them, but with a strange perversity they almost invariably refuse the best queen given, unless it be a virgin queen that has just emerged from the cell. The workers are advanced in age, and will die off rapidly, so on the whole the best thing you can do is to break up the colony, giving the bees and combs to other colonies.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. SEPTEMBER 7, 1899. NO. 36.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Philadelphia Convention will have about closed when the majority of our readers receive this number of the American Bee Journal. This week we give the pictures of the officary of the United States Bee-Keepers' Association. On the first page are the Executive Committee—the three officers that have in charge the management of the annual conventions. Then follow the Board of Directors and the General Manager. Mr. Whitcomb is the only one who is doubly honored, being the president as well as director. We think the whole nine make a fine looking group—a body of men of whom American bee-keepers may well be proud.

Bee-Keeping at Experiment Stations is a subject that Mr. Abbott touches on in another column. And he is right in saying that this intensely interesting line of work is practically ignored by the majority of experiment stations and agricultural colleges in this country. You will find that dairying, sheep-raising, fruit-growing—in fact, nearly every other industry under the sun receives more or less attention, but bee-keeping—well, it doesn't seem to be "in it" at all.

In view of the close relation and great benefit of bees to horticulture, and their importance in the production of so many things grown on the farm, one would think that the care of bees would receive attention at every experiment station and agricultural college now in operation. Perhaps if bee-keepers would appeal to those in charge of these institutions, the subject of bee-keeping might be taken up, as it very properly deserves.

Thick Sections.—Mr. Hutchinson, in his Bee-Keepers' Review, has this paragraph on thick sections:

"Page & Lyon made some thick sections to order for two bee-keepers of Wisconsin. The sections were one-sixth of an inch in thickness. This extra thickness so increased the weight of the sections that when they were filled with honey and sold the extra weight would pay for the sections. They also made some nailed sections for a York State bee-keeper, in which two of the sides of the section were of hard maple, five-sixteenths of an inch in thickness. In talking this matter over with a lady bee-keeper, she expressed the opinion that such practices were dishonest, if done for the sake of cheating the ones who bought the honey stored in such sections.

We quite agree with the lady who prefers to get as little wood as possible when buying honey in sections. A certain good mother-in-law that we once knew, used to tell her butcher that she preferred to have no bones in the meat she bought, as she "couldn't eat bones." Neither can most people eat wood.

We see no excuse for using thick sections; unless the honey is to be sold by the section instead of by the pound, then it would be all right to use them.

Honey in Uintah Co., Utah.—In a newspaper sent to us by Mr. G. W. Vangundy, we find the following referring to the apiarian possibilities in that region:

"If there was ever a land that literally flowed with milk and honey Uintah County is certainly entitled to that cognomen. Think of a comparatively small settlement shipping out of its borders ten carloads of extracted honey! Startling as the statement may seem at first, it is none the less true that such is the expectation this summer and fall. The place is simply a paradise for the bees. Last year Jos. Hacking alone produced and shipped 36,000 pounds of honey, while the Burkett Bros. and Mr. Merley each shipped almost as much. There is great money to be made there in the honey-business."

"**Know Your Honey-Resources**" is a text upon which G. M. Doolittle frequently preaches. S. P. Culley, of Lafayette Co., Mo., in the Progressive Bee-Keeper, emphasizes the importance of knowing what flowers yield in one's locality, and when they yield. Twenty years ago his locality furnished little or no white clover. The best flow was to be expected from the latest sumac. He says further:

"But white clover is now abundant, and furnishes a flow in May and June to take the place of the flow sumac formerly gave July 15 to Aug. 15; and just here who will contend that this change from sumac to white clover, from harvest in mid-July to May and June, does not make necessary very important changes in management? Then early brood-rearing was not important; now it is all-important. Then the bee-keeper needed to see to it that his colonies had bushels of bees by July—an easy task; now he wants them strong by May 25—a thing far more difficult."

Honey Exhibits at Fairs is a subject upon which Mr. D. W. Heise, of Canada, wrote a paper for the last meeting of the York County Bee-Keepers' Association. Mr. H. calls attention to some valuable advantages to be gained by such exhibits, among which we wish to call attention to the following:

A pleasing feature is noticeable in selling honey at fairs, inasmuch as a very large percentage of it is sold to parties who rarely come in contact with honey at any other time. Thus an increased demand is created without in any way affecting the producers' established trade; and it also diverts a considerable amount from the large city markets, the flooding of which always has a demoralizing effect on the price of honey generally.

In no other way can honey be brought so prominently before the public attention as by a large and creditable display at fairs. Especially will this apply to the larger exhibitions in the provinces, such as Ottawa and Kingston in the east, Toronto more central, and London in the west, where hundreds and thousands of consumers come face to

face with a sweet reality, the product of the bee-keeper thru the aid of his thousands of busy workers. A desire is created within those who have never used honey, to sample the delicious-looking sweets, which usually results in a purchase being made, thereby creating an appetite and a demand which it would be difficult to accomplish in any other way.

Now a few words as to the injury that may be done to the bee-keeping industry by unwise practice on the part of an exhibitor. Knowledge has come to some of us that certain indiscreet honey-producers make the fairs a dumping ground for the inferior part of their crops. This practice, if permitted to be carried on extensively, will certainly tend to very much injure the reputation as well as materially lower the price of good honey. Only the very first quality of honey from the different sources should be permitted for sale on the grounds of any public fair.

Convention Reports are discuss with wisdom by F. L. Thompson in the Progressive Bee-Keeper. He refers to the too common error of saying that such and such a topic was handled in an interesting manner, but that is of no value so long as the important part—the matter of the discussion—is left out. One trouble is that the secretary has so much to attend to that it is impossible to give a full and reliable transcript of the discussions. Some one should be appointed whose duty it is to report the discussions, and to do nothing else. He should not try to write out in full what is said, but use catch-words and catch-phrases, always using a lead-pencil, writing out his notes soon after the meeting.

Extracted Honey Tare.—According to W. A. H. Gilstrap, in Gleanings in Bee-Culture, a vigorous and somewhat effective protest has been raised against the practice of deducting as tare a number of pounds exceeding the actual weight of the honey-packages. The actual weight of the wooden case is usually taken, but some practice deducting 3 pounds for each tin can containing 60 pounds, when the actual weight is only 2½ pounds. On the San Joaquin valley crop (California), estimated at 150 cars, that makes a difference of 20,000 pounds. Right is right, and bee-keepers should insist on deduction of actual tare.

Good Yields of Honey.—In an interview with S. A. Niver, reported in Gleanings in Bee-Culture, he says his average for five years—a year of almost total failure included—has been between \$6.00 and \$6.25 per colony. His best colony, last year, gave 175 finisht sections, which brought \$19.25. He says Mr. Coggs shall figured up 116 days' work during the year 1897, and sold 78,000 pounds of honey, which Editor Root figures up at \$20 a day, if the honey brought only 3 cents a pound, or \$27 at 4 cents a pound. Now Mr. Coggs shall has gone to a sanitarium for treatment and rest.

Cogitator will not cogitate any longer for the American Bee Journal. Mr. E. E. Hasty, of Richards, Ohio, will hereafter furnish the "Afterthoughts." For many years he reviewed the bee-papers for the Bee-Keepers' Review, so he has had much experience as a writer on apiarian topics. We feel certain that his addition to our editorial staff will be welcomed and appreciated by all the readers of the old American Bee Journal. We fully expect that Mr. Hasty will equal Cogitator in his "afterthoughting." A fair sample of his work is given in this number.

The Philadelphia Convention Report we expect to begin to publish very soon after the meeting, or just as soon as Secretary Mason can furnish us with the copy. A full shorthand report will be taken, so our readers may confidently look forward to a feast, as the program is one of unusual interest. We can say this with a clear conscience, as our name is not on the program anywhere.

THE AUSTRALASIAN BEE-KEEPER is a new bee-paper just launcht by Pender Bros., in New South Wales, Australia. It is a neat publication, and makes a creditable appearance. Mr. W. S. Pender, who was in this country last winter, is its editor. We wish the "new baby" a successful career.

MR. G. W. NANCE, of Woodbury Co., Iowa, wrote us Aug. 21, that on Aug. 7 his honey-house was struck by lightning and burned to the ground, the loss being about \$400, with an insurance of \$240 on the house and bees-supplies. We regret to learn of Mr. Nance's loss, but congratulate him on his good fortune in having had it insured.

MRS. JOHN J. GLESSNER, of Chicago, who is now at her summer home in Grafton Co., N. H., writing us Aug. 16, said:

"The honey crop is poor here, but the care of bees grows more fascinating. I received a queen in good condition, and safely introduced her to a colony of Carniolans. I like the Italians best. I have my own little way of introducing queens, and am very successful."

MR. G. W. VANGUNDY, of Uinta Co., Utah, wrote us Aug. 13 that his locality would have only two-thirds of a crop of honey this season. Some time ago we announced in this column that the firm of E. A. Beers & Co. would represent the bee-keepers of Uinta County in the marketing of their honey, but Mr. Vangundy informs us that any one of the officers of their local bee-keepers' association is abundantly able to attend to the selling of their crop, and that the association is getting along very nicely. It is expected that all their members will soon unite with the United States Bee-Keepers' Association. Just the thing to do.

MR. STENOG—the one who furnishes the "Pickings" for Gleanings in Bee-Culture, from their "neighbors' fields"—wrote this paragraph, referring to some letters in the American Bee-Keeper:

"Mr. Hill continues his interesting letters from Cuba. The insects of that island lead me to believe that a hybrid climate like ours, where Jack Zero reigns a good deal of the time, is preferable to one of perpetual heat."

We presume that means Stenog prefers Heaven to the "other place," where it is said that the "heat" is not only "perpetual," but hot boiled down.

E. R. HAYES, of Topeka, Kans., seems to deserve a free advertisement. The following is given in Gleanings in Bee-Culture, and we are quite willing to "pass his name along!":

"We regret to be obliged to warn our friends against sending any honey to E. R. Hayes, of Topeka, Kan., or trusting him in any way. D. S. Jenkins, of Colorado, sent him a lot of honey last October. Hayes said, when Mr. J. offered the honey, 'I will send my draft on arrival of goods.' Since then Mr. Jenkins cannot get a word from him, and we have written to Mr. Hayes twice, the last time telling him we would publish him unless he made some sort of answer; and altho we have given him several weeks' time to make a reply, we cannot get a word from him in any way, shape or manner. Will the other journals please pass his name along unless he can be made to talk, or give some reason why he does not talk."

We might also add the name of H. P. Robie, of Sioux Falls, S. Dak., to the list of those who defraud bee-keepers by getting honey and refusing to pay for it.

The Premium offered on page 572 is well worth working for. Look at it.

A Bee-Veil Long Enough being asked for in *Gleanings in Bee-Culture*, Dr. Miller advises sewing the veil to the edge of the hat-brim, thus making the veil come down farther than if fastened around the crown of the hat. The editor thinks Mr. Coggshall's plan still better. Have a hat with a very wide brim, and sew the veil to the underside of the brim, but so far from the edge that the veil will be shaded from the direct rays of the sun. The sun shining on the veil makes it especially hard to see thru, the trouble being greatest early or late in the day when the sun is near the horizon.

Are the Dark Cappings of Sections Colored Clear Thru?—Editor Root and Dr. Miller are at loggerheads on this question. Mr. Root says he examined several thousand pounds of honey from different parts of the country, and three-fourths of the so-called travel-stained faces showed on examination that the stain went *clear thru* the capping. But Dr. Miller says he *knows* that a section cap white as snow becomes dark if left on the hive long enough, especially in the center of the super, and asks, "Now, don't you believe the white capping still remains white, with a dark coating over it?"

The Royal Palm as a Honey-Plant. Mr. Snyder having called attention, in the *Bee-Keepers' Review*, to the fact that Mr. Somerford had reported royal palm as yielding a surplus, while Mr. Poppleton had reported it as not yielding a surplus, Mr. Poppleton says the difference between the two is more seeming than real. Mr. Poppleton's experience of two years in Cuba was in what he considered a largely overstocked locality, 400 or 500 colonies being in the one apiary. During the time of bloom of royal palm only a few colonies stored surplus, while Mr. Somerford, in a region less densely stocked, might have found a good surplus stored from the plant.

A Trap for Honey-Loving Bears.—Editor Hill thus describes it in the *American Bee-Keeper*:

"It is simply a strong box, about 14 inches deep and 10 inches square, with a number of 3-inch light wire-nails driven thru and inclined downward from the outside. Then a piece of comb honey is placed in the bottom, and the arrangement left at some convenient place. The bear, it is said, will thrust his head to the bottom after the sweet morsel, but when he attempts to withdraw it, he finds he has a nightcap that persists in being worn thereafter, and the bee-keeper finds him tumbling about, thus blindfolded, when he arrives in the morning.

Bees Crossing Larvæ for Queens.—Dr. Miller and the editor of the *Bee-Keepers' Review* are at a dead-lock with regard to the age at which bees choose larvæ for rearing queens. The former insists that when a queen is removed the bees choose larvæ sufficiently young, but continue to start cells for several days, and then they use larvæ that are too old, not from choice, but because no younger are present. He asks Editor Hutchinson to make fresh trial and report results. This Mr. H. politely declines, but says: "Let me tell you just what I do know about this matter. I know from a great number of trials that when bees are given larvæ of all ages from which to rear queens, that some of the queens are very poor; while if given only eggs, or just-hatched larvæ, all of the queens are good."

Doolittle Queen-Cells two dozen of them—make a full-page illustration in a recent issue of *Gleanings in Bee-Culture*, upon which the bee-keeper would gaze for a long time. The picture is a fine one, and the cells are fine, of that kind from which the experienced bee-keeper will confidently expect fine queens. They were reared in a hive of one story, a laying queen being in the hive all the while. But the hive was separated into three compartments. The central compartment was the one in which the cells were produced, the queen not being allowed in this central compartment, but alternately in either of the two outside compartments, the workers having the free run of the compart-

ments by means of division-boards furnished with perforated-zinc. The central compartment had a capacity of three frames, on either side of the frame of cells being a frame of young larvæ. Preference seems to be given to cells fastened on a stick as compared with those fastened on the lower edge of a comb. When a larva is put into a cell, there is placed at the same time in the cell a bit of royal jelly about as big as a double-B shot. The jelly should be of the right age, an ordinary natural queen-cell of two or three days' growth furnishing jelly for six, and sometimes for twelve cells.

Moving Bees Short Distances.—Dr. Mason says in the *Bee-Keepers' Review* that when bees are moved several miles they do not return to the old location, not because of the distance they have been moved, but because of the disturbance in moving. So for 25 years he has made a practice of disturbing bees when moving them only a short distance, after the plan given by E. R. Jones, and has never made a failure till this year. When the Doctor wants to move bees a short distance, he closes the hives with wire-cloth, and if not ready to move them at once, he sets them in the shade for half a day or longer. Then he puts a colony on a wheelbarrow, wheels it back and forth on the sidewalk, whose unevenness keeps up a constant jar, till he has wheeled it 40 rods or more, then puts it where he wants it, and it stays put. But this year he says the plan was a flat failure.

Virgin Queens and Drone-Comb.—On page 403 of this journal, C. P. Dadant says that queenless bees to which a queen-cell is given will build nothing but drone-comb till their young queen is laying. Critic Taylor says in the *Bee-Keepers' Review* that such is not his experience. He examined a number of nuclei in which eggs were not yet hatching, and in one at least there were yet no eggs, and found all the new comb entirely worker. Thinking the strength of a colony might have something to do with the case, he put a swarm with a virgin queen in three sections of the Heddon hive, the swarm being strong enough to crowd the three sections, and five or six frames in the upper section were largely devoid of comb. This was in the midst of a moderate basswood yield, and he says: "Now the frames mentioned are almost entirely filled with comb, and not a sign of drone-cell anywhere; and the queen is not yet laying." It will be interesting to discover whether there may not be some difference of conditions not yet fully understood that may account for the difference in observations.

Carrying Swarms on a Bicycle.—I have secured swarms of bees in sacks, and carried them on a bicycle. It sometimes happens that a farmer will say a swarm of bees is hanging on a limb a mile or so from the office. It would hardly pay to send a man with a horse and buggy; but with a bicycle and cheese-cloth sack I can very soon have those bees back home and in a hive. The sack should be carried by the upper end, where it is tied. Before the sack is tied, however, the bees should be shaken down to the bottom, and then the string should be secured four or five inches above the mass of bees. I usually carry the sack in one hand, and guide the bicycle with the other.

A year or so ago there appeared an account of how a very enthusiastic youth, seeing a swarm of bees remote from his home, was particularly anxious to secure the bees and take them. What did he do but remove his "pants," tie the legs of them together, shake the bees into them, and rush home? No mention of the fact is made of *how* he got home, or whether he was stung or not, or whether he met any one on the way; but the fact was clearly brought out that the bees were *hived*, and finally developed into a prosperous colony.

Taking this incident as a cue, I do not see why we cannot use the cheese-cloth sack in the manner I have described. The body of the sack can be slipped clear up over the cluster of bees as they are hanging on the limb; and, if more convenient, the mouth of the sack can be tied around the limb so as to make it bee-tight; the limb can be cut, and our bees brought home in triumph.—*Gleanings in Bee-Culture*.

Langstroth on the Honey-Bee, revised by the Dadants, is a standard, reliable and very thoroly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the *American Bee Journal* should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the *Bee Journal* for a year—both for only \$2.00.

Root's Column

HONEY WANTED.

We are in the market for both comb and extracted honey. If you have any to offer, let us hear from you **AT ONCE** stating the grade, number of pounds of each grade, from what source gathered and **HOW** it is put up. If extracted, send a sample by mail.

We Handle

Several Carloads Every Year....

and may be able to refer you to a buyer if we cannot handle it ourselves.

See our ad in this column for July 6th issue for

Honey-Packages...

Five-gallon square Cans are now \$8.00 per ten boxes instead of \$6.00.

ADDRESS

THE A. I. ROOT CO.
MEDINA, OHIO.

In the multitude of counsellors there is safety. Prov. 11-14.

The Style of Hive Preferred.

Query 102.—What make or style of hive and super do you prefer? Why? WEST.

Prof. A. J. Cook—Langstroth. Most use it.

Dr. J. P. H. Brown—I use a modification of the Langstroth hive.

Emerson T. Abbott—The "St. Joe." Because it is made to suit me.

C. H. Dibbern—I. The Dibbern. 2. Because it suits me better than any other.

Mrs. L. Harrison—Eight-frame Langstroth, with Heddon case. Because it's good enough.

D. W. Heise—Langstroth length. Quinby depth; super same. "Why?" Gives me better results all around.

W. G. Larrabee—Langstroth 10-frame hive, and 16-pound slatted-bottom super. Because I like it the best.

E. Whitcomb—Any make with movable frame. For the reason that about the same results are attained, with the same care.

J. M. Hambaugh Ten frame Simplicity, because it combines more desirable features, in my estimation, here in California.

E. France—I prefer a quadruple hive, with Langstroth frames. There is better winter protection when wintered out-of-doors.

O. O. Poppleton—I prefer what is known as the Long-Ideal hive, with no super. This is mainly for obtaining extracted honey.

Rev. M. Mahin—The one I use, but I cannot describe it here. In several features my hives and supers are peculiar to myself. They just suit me.

Eugene Secor—I use the 8-frame Langstroth hive with super to match, both the T and the open frame to support sections. Separators preferred in all cases.

R. C. Aikin—T super or a compression super without T's or slats, separators to support sections; square-joint hive as in dovetailed; brood-chamber a flattened cube.

Jas. A. Stone—Improved Langstroth-Simplicity, because I think it is the easiest to manipulate and as simple in construction as I think it possible to make a No. 1 hive.

Mrs. J. M. Null—For comb honey and cellar-wintering B. Taylor's, or Heddon's divisible, or 8-frame hives. For out door wintering bees do better in deeper frames.

G. M. Doolittle—My own. Because—because—well, any of the good hives on the market will give good results if there is plenty of brain, muscle and push behind them.

Dr. C. C. Miller—I don't know, as yet, how it may be about some of the new supers, but as yet I like the T super and the dovetailed hive. Too long a story to tell why.

J. A. Green—A modification of the Heddon hive, made by myself (none for sale), with super containing what are known as

A Good Wagon

begins with good wheels. Unless the wheels are good the wagon is a failure. IF YOU BUY THE ELECTRIC STEEL WHEEL made to fit any wagon—your wagon will always have good wheels. Can't dry out or rot. No loose tires. Any height any width tire Catalog free. **ELECTRIC WHEEL CO.** Box 16 QUINCY, ILL.

Please mention Bee Journal when writing.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | 5lb | 10lb | 25lb | 50lb |
|-----------------------------|-----|--------|--------|--------|
| Sweet Clover (melilot)..... | 60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover..... | 70c | 1.25 | 3.00 | 5.75 |
| White Clover..... | 80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover..... | 60c | 1.20 | 2.75 | 5.00 |
| Crimson Clover..... | 55c | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, if wanted by freight.

Your orders are solicited.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

QUEENS

Either 5-banded, Golden or from IMPORTED Italian mothers, 60c each; or 6 for \$3.00. A few fine breeders at \$1.50 each. Give me a trial and let me surprise you. Satisfaction or no pay. **CHAS. H. THIES, Steeleville, Ill.** 33Atf Please mention the American Bee Journal.

UNION COMBINATION SAW—For ripping, cross-cutting, mitering, rabbeting, grooving, planing, scroll-sawing, boring, edgemoolding, bending, etc. Full line FOOT AND HAND POWER MA-

CHINERY. Send for Catalog A.

Seneca Falls Mfg. Co., 46 Water St., Seneca Falls, N.Y.

Please mention Bee Journal when writing.

I HAVE an infallible remedy that will kill the POISON OF BEE-STINGS within THREE minutes after application. Any person sending 52 cents to M. Q., Lock Box 400, SPRINGFIELD, Mo., will receive this valuable recipe by return mail. 34Atf

Queens at half price

Balance of season. Select Tested Italian Queens, \$1.00; Untested Italian Queens, 50 cents. Every Queen warranted to give satisfaction or your money back. Queens by return mail as long as they last. Address, **F. A. CROWELL, Granger, Minn.** 34Atf

Please mention Bee Journal when writing.

BEE-HIVES, SECTIONS, SHIPPING-CASES—everything used by beekeepers. Orders filled promptly. Send for Catalog. **Minnesota Beekeepers' Supply Mfg. Co., Nicollet Island, Minneapolis, Minn.** 18Atf

BY RETURN MAIL GOLDEN BEAUTY ITALIAN QUEENS

—feared from IMPORTED MOTHERS. Untested, 50 cents; Tested, \$1.00.

TERRAL BROS., Lampasas, Lamp. Co. Tex. 18Atf Please mention the Bee Journal.

Comb Foundation

Wholesale and Retail.

Working Wax

INTO FOUNDATION FOR CASH A SPECIALTY.

DO NOT FAIL

Before placing your order, send me a list of what you need in

Foundation, Sections,

And other Supplies, and get my prices. You will get the best goods and save money. Illustrated Catalog Free. **BEEWAX WANTED.**

GUS DITTMER, Augusta, Wis. Please mention Bee Journal when writing.

Golden Italian Queen Free For sending us One New Subscriber.

To any one who is now a subscriber to this journal, and whose subscription is paid to the end of 1899, or beyond, we will mail a Golden Italian Queen free as a premium for sending us one new subscriber for a year, with \$1.00 to pay for same.

Address, **GEORGE W. YORK & CO.,**
118 Michigan Street, CHICAGO, ILL.

The American Poultry Journal

325 Dearborn Street, CHICAGO, ILL.

A Journal that is over a quarter of a century old and is still growing must possess intrinsic merit of its own, and its field must be a valuable one. Such is the American Poultry Journal. 50 cents a Year. Mention the Bee Journal.

The Rural Californian

Tells all about Bees in California. The yields and Price of Honey; the Pasturage and Nectar-Producing Plants; the Bee-Ranches and how they are conducted. In fact the entire field is fully covered by an expert bee-man. Besides this the paper also tells you all about California Agriculture and Horticulture. \$1.00 per year; 6 months, 50 cents. Sample copies, 10 cents.

THE RURAL CALIFORNIAN,

218 North Main Street, - LOS ANGELES, CAL.

BARNES' FOOT POWER MACHINERY

Read what J. L. PARENT, of Charlton, N. Y., says: "We cut with one of your Combined Machines, last winter, 50 chaff hives with 7-in. cap, 100 honey racks, 500 brood-frames, 2,000 honey boxes, and a great deal of other work. This winter we have double the amount of bee-hives, etc., to make, and we expect to do it with this Saw. It will do all you say it will." Catalog and price-list free.

Address, W. F. & JOHN BARNES, 507 995 Ruby St., Rockford, Ill.

Please mention Bee Journal when writing.

Saw Wanted

I want a second-hand SAW for making hives. Address, CHAS. ARNESON, 35A21 TAWNEY, Fillmore Co., MINN. Please mention Bee Journal when writing.

IF YOU WANT THE BEE-BOOK

That covers the whole Apicultural Field more completely than any other published, send \$1.25 to Prof. A. J. Cook, Claremont, Calif., for his

Bee-Keepers' Guide.

Liberal Discounts to the Trade.

330 Market Street, - SAN FRANCISCO, CAL. Please mention Bee Journal when writing.

"section-holders"—single-tier wide-frames with tin separator nailed on, without top-bar. I adopted these because I thought they were best, and I have seen no reason to change my mind.

J. E. Pond—I prefer the Simplicity Langstroth hive, with 7-inch wide super, of a size that four will fit a frame 4 1/4 x 1 1/4 x 1 7/8. I do not know that there is any great choice in supers, except they should be of convenient size.

R. L. Taylor—The Heddon. Because with it I can most conveniently suit the size of the colony—give a small brood-chamber to a swarm—and get along with very little handling of frames, without any offsetting disadvantage.

P. H. Elwood—The Quinby-Hetherington hive. It is best to move; best to find queens in, because the light floods all parts and there are no hive-corners for queens to hide in. I have yet to find a hanging frame that I can manipulate as quickly.

Mrs. A. J. Barber—Eight-frame dovetailed with section-holders. For one reason, they are small enough so that they are not too heavy to handle. I have used them more than any other, and they seem more convenient than any other to me.

Dr. A. B. Mason—Langstroth. Because I like it better than any other I have tried. I produce extracted honey and use same size combs in the super as in the brood-nest. Occasionally, I produce a little comb honey, using either the T super or section-holders with fence separators.

G. W. Demaree—I prefer the modernized Langstroth hive, with duplicate story for taking honey with the extractor, and the T tin support section-cases, for comb honey. In the Middle and Southern States the 10-frame hive is best, while in the North the 8-frame size may be used with good results.

C. Davenport—Nearly all the frame hives I have in use are made on the same principle as the dovetailed, because it is the handiest, most convenient, and most practical hive I know of for a single brood-story hive. I am using various kinds of supers, but am not satisfied with any of them.

S. T. Pettit—I can answer better by giving the size of frame and number used. If I were starting again I would make my hive a little longer than it is. I would make the frames 15 inches long, 9 1/2 inches deep, and 12 in each hive. Reason: More room for supers, and gives long entrance for ventilation. Many hives now used are too small, so I think.

A. F. Brown—For general use the 10-frame dovetail white-pine hive, standard Langstroth size frame, two stories. For comb honey I would prefer the same number and depth of frames, but would reduce the length to about 14 inches. I have used such hives with very satisfactory results. For comb honey super I have used those having section-holders, with wood separators.

Adrian Getaz—My own, of course. For description see American Bee Journal of

HATCH AND BROOD ILLINOIS.

your chicks with machines that leave no doubt of success. A simple, durable and perfect machine is the
Made in several convenient sizes, from 50 eggs up. Impervious to sudden changes in temperature, Packed with asbestos and covered with iron. May 6, 1897. The main points are a brood-nest of sufficient size, chaff protection for brood-nest and supers, against both cold and excessive heat. I consider essential that the supers should be protected, so as to keep them warm during the night and thus keep comb-building going on, day and night.

E. S. Lovesy—I use and prefer the Langstroth hive. With all due modesty I have to admit that I like our own make of super the best; it is a super that I adopted three years ago. Myself, Mr. Bouck, Mr. Dudley, and many others are using it here now. It may have been used before, if so I did not know it. It consists of separators and double section-holders so arranged as to completely box in all sections, thus keeping them clean and free from travel-stain.

A Good Report.

I began in the spring with three colonies, two fair ones, and one rather poor. I extracted honey from the two good ones, and the third one I worked so that I got seven small colonies out of it. I got in all 200 pounds of extracted honey, and have now 10 colonies. JOSEPH MAYER, Sheboygan Co., Wis., Aug. 21.

Bee-Keepers Discouraged.

The honey crop in our locality is very small this year. I have taken only 1,000 pounds of comb honey from the carload of bees (100 colonies) that I brought here in June. The bees have increased to 175 colonies by natural swarming, and are in good condition for winter. The fatality among bees in this locality last winter and spring I think was fully 90 percent, and bee-keepers are discouraged. I. A. TRAVIS, Wood Co., Wis., Aug. 21.

Very Poor Season for Bees.

My bees have stored no honey since Alsike clover bloom, and there is but little hope of their getting winter stores. Spanish-needle, goldenrod and boneset—our only show for fall honey—are all in bloom, and I yet have to see the first bee on any of it. S. W. SMILEY, Lincoln Co., Mo., Aug. 25.

Hunting Bees in Trees.

In giving my way of bee-hunting, on page 499, I failed to give my method of starting bees when they cannot be found on flowers. First go to a place where you think there are wild bees; build a fire, into which throw stones, and when they are heated take to the side of the woods where the wind will take the smoke into the woods. Then take three sticks of wood about five feet long, and set them up in a triangular form and place the bait on the vertex; put the heated stones below the bait, then drop some honey on the hot stones, or sugar will do, and the fumes will attract bees, if there are any in the vicinity.

I guarantee this method to catch them every time. SAMUEL VARNES, Coshocton Co., Ohio.

Too Wet and Too Dry.

EDITOR YORK:—I am a bee-keeper in a small way, so I thought I would join your throng of writers who have something to say. Bees are not a success with us this year. The early part of the season was too wet, and now it is too dry; even the buckwheat is drying up, without giving the poor bees half a chance. And as far as many of my bees are concerned, they will

have to gather in stores from the house, that they laid by a year or two ago, which will be given them in a rather thin honey syrup put in pans, into which plenty of clean cobs are thrown for the bees to stand upon while sipping the sweet; and they will soon empty the pans. It is surprising how quickly they will do the work.

When it was time for the bees to work in the spring I had 14 colonies left out of 45 wintered over. That was spring dwindling in earnest, for nearly all left a good quantity of honey in the hives, so they had no need to starve, tho according to some writers they might have done so. I now have 22 colonies.

MARY E. ALLEN.
Manistee Co., Mich., Aug. 24.

Bees Not Making a Living.

Bees are not making a living around here this fall. There is no buckwheat, and white clover didn't yield any honey to speak of.

L. J. BERGH.
Daue Co., Wis., Aug. 24.

Bees Doing Well.

Bees are doing well. I took off the first super of buckwheat honey yesterday, making 75 pounds for that colony—clover 55 pounds, and buckwheat 20 pounds.

L. C. SALSBERY.
Bradford Co., Pa., Aug. 20.

Prospects in Nebraska.

Our winter losses last winter were fully 50 percent, which was about made up by swarming this season. So far we have had but little surplus honey, and will have no more than enough to supply the home demand.

Our best honey-plants were badly winter-killed. White and red clover and hoar-bound suffered the most. Basswood, altho it bloomed profusely, yielded very little honey, and our principal dependence for the fall run—heart's-ease—is giving us very little yield on account of the extremely hot weather.

I see so much said in the Bee Journal

about foul brood. I have kept bees 20 years, and handled on an average 500 colonies annually, and never had a case; in fact, I have never seen foul brood. We have had a few cases of paralysis, but can usually soon cure them by the methods spoken of in the Bee Journal from time to time.

J. L. GANDY.
Richardson Co., Nebr., Aug. 24.

A Canadian's Report.

I am well pleased with the Bee Journal, as I take quite an interest in bees. I had eight colonies in the spring and now have 16 strong ones. I have been bothered a little with after-swarms. I have been taking off the queen-cells, and I think they will give up the notion of swarming now. I use two-story chaff hives with eight brood frames. I have 800 pounds of honey now. The way I keep the bees working is to put all extracting-frames on about the middle of May, and when they are full I extract them when about half the honey is sealed over. The swarms I hive on foundation in brood-frames and if the weather is hot I put the sections on. Whatever they get above their needs I take. I always take the queen-cells off the eighth day after the first swarm has issued. My bees are Carniolans and blacks.

P. A. BARR.
Ontario, Canada, Aug. 21.

Bees Doing Well.

My bees are doing well, at least they appear so to me. From eight colonies spring count I have increased to 19, losing three or four swarms by their decamping. I have sold some 300 sections of white clover honey at 15 cents per section, and I expect three or four hundred more. I have several styles of hives in use, and three styles of sections. They all have points of advantage and disadvantage. I may give them some time. There are difficulties that I may be able to overcome. For instance, the 4x5x1³/₈ section gave me lots of annoyance to start with, and I have not entirely gotten over the idea that they are ¹/₂ inch too thin yet. My trouble was to get the

The Novelty Pocket-Knife

A heavier and stronger knife than the one we offered heretofore.

THIS CUT IS THE FULL SIZE OF THE KNIFE.

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife. We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal with \$3.00, and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

foundation exactly in the middle, so the bees would build cells on both sides of the foundation and cap them over. A full sheet gave the best filled sections; starters were good, except scant at the bottom, but nicely filled if turned over at just the right time. But I want full sheets, then the cells are all alike, otherwise the starter will be worker-cells and the rest of the section is apt to be drone cells, and looks coarse. Sioux Co., Iowa, Aug. 22. F. W. HALL.

Little Surplus from Alfalfa.

Bees are working for dear life on buckwheat. Should we get another rain they will be fit for winter stores; otherwise they will have to be fed. There was very little surplus from alfalfa. S. HARTER. McPherson Co., Kan., Aug. 23.

Time to Plant Bulbs.

"This is the season of the year in which to set out bulbs. Prepare the ground for them before they are received, by having it dug up to a depth of at least a foot—a foot and a half is better—and work over until it is mellow," writes Eben E. Rexford in the September Ladies' Home Journal. "Mix with it a liberal quantity of old rotten manure from the cowyard, or, if this is not obtainable, use bonemeal in the proportions of one pound to a square yard of soil. If the soil is naturally heavy, it is well to add considerable sand to make it lighter and more porous. Plant the bulbs as soon as possible after they are received, as they are greatly injured by exposure to the air. Set tulips and hyacinths six inches deep, smaller bulbs from four to five inches. All bulbs should be placed five or six inches apart, and each kind kept by itself."

The Bee-Keeper's Guide

Or, Manual of the Apiary, BY PROF. A. J. COOK.

460 Pages—16th 1899 Edition 18th Thousand \$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to give away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the TWO new subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

BEE=BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Biene-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienezucht und Honiggewinnung, nach der neuesten methode (German) by J. P. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Aug. 19.—A few consignments of comb honey received this week, some cases of fancy in plain sections sold at 15 cents, other lots at 13@14 cents, while No. 1 sold at 12@13c; amber grades, 10@11c; dark, 7@9c. Extracted, white, 7@8c; amber, 6½@7½c; dark, 6c. All selling well. Beeswax, 25@26c.

R. A. BURNETT & Co.

KANSAS CITY, Aug. 10.—The receipts of honey are light, demand fair. We quote: Fancy white comb, 15c; No. 1, 14c; No. 1 amber, 12@13c. Extracted, white, 6@6½c; amber, 5½@6c; dark, 5@5½c. Beeswax, 22@25c.

C. C. CLEMONS & Co.

NEW YORK, Aug. 22.—Demand good for new crop comb honey, excepting buckwheat. We quote as follows:

Fancy white, 14@15c; No. 1 white, 12@13c; fancy amber, 11c; No. 1 amber, 10c. Extracted firm at unchanged prices. Beeswax dull at 25@26c.

HILORETH & SEIGELKEN.

SAN FRANCISCO, Aug. 25.—White comb, 11½@12½c; amber, 8@10c. Extracted, white, 7½@7¾, light amber, 6½@7c. Beeswax, 26@27c.

Market is firm at unchanged quotations, with demand fair and offerings light. The last Panama steamer took 312 cases extracted for New York. The ship Centesima sailed with 349 cases for Liverpool; another took 4,000 lbs. beeswax.

CLEVELAND, Aug. 18.—New honey scarce and in good demand. Fancy white, 15c; No. 1 white, 13@14c; fancy amber, 12c; No. 1 amber, 10@11c.

A. B. WILLIAMS & Co.

BOSTON, Aug. 18.—Fancy white comb, 1-pound sections, 15@16c; A No. 1, 14c; No. 1, 12@13c; No. 2, 10c. Light amber extracted, 7c. Beeswax, 27c.

The demand for honey is very light, as is usual this time of year. While stocks are extremely light, the old being practically gone, and no new as yet. Owing to poor crop prospects prices are firm, and it looks as if they would remain so. BLAKE, SCOTT & LEE.

BUFFALO, Aug. 25.—Receipts of fancy new 1-pound combs are very light, selling at 13@14c; fair to good, 10@12c; low grades less. Advise moderate shipments for the present. Some fancy beeswax wanted at 28@30c.

BATTERSON & Co.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14@15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7@7½c.

PEYCKE BROS.

DETROIT, Aug. 19.—There has been no offerings of new honey and old is fairly well cleaned up. Fancy white we think would bring 14 cents, other grades proportionately cheaper. White extracted, 7@8c; no dark to quote. Beeswax in good supply at 23@24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

THOROLY TAUGHT

BY MAIL.

Trial Lesson **FREE**, Send stamp for Catalog.

Eclectic Shorthand College,
 Headquarters of the Cross Eclectic System.
518 Ashland Block, CHICAGO.
 39Aly Please mention the Bee Journal.

I ARISE

To say to the readers of the BEE JOURNAL that **DOOLITTLE...** has concluded to sell **QUEENS** in their season during 1899, at the following prices:

- 1 Untested Queen \$1.00
 - 6 Untested Queens.. 4.50
 - 12 Untested Queens 8.00
 - 1 Tested Queen 1.50
 - 3 Tested Queens.... 3.50
 - 1 select tested queen 2.00
 - 3 " " Queens 4.00
- Select Tested Queen, previous season's rearing, 13; Extra Selected, for breeding, the very best, \$5.00. About a pound of Bees in a 2-frame Nucleus, with any Queen, \$2.00 extra.

Circular free, giving full particulars regarding each class of Queens. Address,

G. M. DOOLITTLE,

Borodino, Onondaga Co., N. Y.

Rearing Queens in Full Colonies—Starting Cell-Cups by Natural Methods.

BY HENRY ALLEY.

FOR a good many years I have had no trouble in getting all the cell-cups made that I needed, and in a way most natural for bees to construct them. This is the way I do it:

We will suppose that there are eggs or larvæ properly matured, from which bees will start queen-cells. The right age of eggs for this purpose is about 84 hours, reckoning from the time the eggs were deposited. Now, there is but one way to compel bees to start cell-cups, and that is by making them queenless. My way of preparing bees for this work is this:

I have a box, a duplicate of the regular brood-nest a full colony occupies, to the bottom of which is nailed wire-cloth. Over this wire, at the ends, are nailed 7/8-inch cleats to keep the bottom of the box above anything it is resting on, so that the air can be admitted freely at all times. A frame cover is made, and that also is covered with wire-cloth. When ready for the bees I take the cover of the box and go to any strong colony in the yard, remove the sections or whatever covers the frames, and place the wire cover on the hive. Then the bees are smoked at the entrance to drive in as many as possible, and also cause them to fill their sacs with honey. I also drum lightly on the hive. Now, to put the bees in such a condition that they can be brushed from the combs into a box, and not all take wing, I use a small amount of tobacco-smoke. I will say plainly that this boxing-up of bees as above cannot be done without the use of tobacco smoke. If rotten-wood smoke is

used, nearly all of the bees will take wing and be in the air quickly; but the tobacco-smoke puts them in just the right condition to be handled to your liking. In fact, they can be handled about as conveniently as so many beans. When the queen is found, the cover is placed on the box, and the bees left alone for several hours, or until they fully realize their queenless condition. Then the eggs are given them in this way:

Cut from any brood-comb, containing eggs that have just hatched, a piece about 4 inches square. Cut this piece in strips, running a knife thru alternate rows of cells. Cut off about half the depth of the cells, and insert the fire end of a common match in each alternate cell, twirling it between the thumb and finger, thus destroying the eggs. Have at hand a shallow pan containing equal parts of bees-wax and resin made quite hot over a kerosene-stove, and dip in the mixture the edge of the comb in which the eggs have not been destroyed, and quickly place it on a stick, as represented in Fig. 1. The illustration shows a standard frame in which are two pieces of wood having a space of 7 1/2 inches between the pieces. The strips should be cut 7 1/4 inches long, and are kept in place by cutting notches in the wood 1/8-inch deep, using 4 pieces of wood to each frame, as shown in the illustration. On each piece of wood a strip of comb is placed. Two of the frames, containing 8 pieces, are placed in a hive having no bottom or top. The hive is then filled with combs containing honey and pollen, but not a particle of unsealed brood; in fact, no brood at all should be used. Now jar the bees down to the bottom of the box by a sudden strike on the floor, and quickly place the one containing the combs over it and put on the cover. The bees will at once run up and take possession of the combs. If this is done in the morning the bees can be placed at night on the stand they previously occupied, and at once be released. I first place a bottom-board on the stand, and then raise the hive and place it thereon. By being careful, no bees are crushed. Many bees rush out and will take wing, but no harm will be done, as they soon return and enter the hive.

While the bees are confined after being given the eggs they must be supplied with water, and kept in a cool place, and in the course of 24 hours a cell-cup will

be started around each egg given them. Let the bees work on the cell-cups from 36 to 48 hours, after which they should be placed in colonies *having a queen not less than one year old.*

Fig. 2 represents another standard frame. One-half of this frame is filled with wood, but, unlike the one described in Fig. 1, the wood is nailed in the upper half of the frame, and not at the ends, as in No. 1, as will be seen. One side of the open space is covered with wirecloth, and two smaller frames are used in this frame, having one of their sides covered with perforated metal firmly nailed to the wood. These frames are just 7½ inches between the vertical pieces, and are notched at the top so the strips of wood to which the cell-cups are made are held in place. The cell-cups are removed from frame No. 1, and then placed in the smaller frames, which are then inserted in frame No. 2, with the open side toward the wirecloth; then the frame is placed in the center of a powerful colony of bees, and *always* between two frames of brood. The result is, in three days more there is as fine a lot of queen-cells as one ever saw.

Twelve days after the eggs are given the bees, the cells should be transferred to nuclei, or, what I consider much better, to a queen-nursery. I feel bound to say that, by this process, I have produced queens much superior to those reared under the swarming-impulse.

To the inexperienced this method may seem fussy. All I can say is that no one can rear queens without doing much hard, pretty fine and fussy work. There are many fine points connected with the above that one must get acquainted with by actual experience. These particular points cannot be explained in one short article. Catch on to them by experience. That is the proper way to do. The cells illustrated were begun and finished by bees. There is nothing artificial about them.—Gleanings in Bee-Culture.

Essex Co., Mass.

New Swarm Deserting the Hive and Queen.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes: "Will you please answer the following questions thru the columns of the American Bee Journal? I had a swarm come out one day. It clustered and was hived in the usual manner. In the evening the bees slowly swarmed out and went back into the old hive, leaving a small bunch of bees in the new hive. These remained six days when they, too, swarmed out. I found the queen with them. What made the most of the bees leave their queen and go back?"

ANSWER. The above is one of the most perplexing things which occasionally happen in the swarming season in a large apiary. The general cause is that a few strange bees from another swarm or elsewhere go in with the swarm when they are on the wing or when running into the hive, and for this reason the queen is balled for safe keeping, or for some other purpose just what I never could determine. Others have told me that it was to prevent the few bees which came in with the swarm, from harming their mother queen, but for some reason there is a lingering doubt about this in my mind. But as I am not satisfied as to the reason, I allow the reason of others to stand till I can prove them wrong.

Where the queen of the newly-hived swarm is thus balled, the bees not finding her running about among their number, seem to think that they have lost her, and so return to the old hive, as all bees of a swarm do when the

queen does not cluster with them from any cause like clipped wings, etc., which does not enable her to fly, only in this case the bees balling the queen, and those very near this ball which can catch the scent of the queen, stay with her. If these returning bees are stopt from going home they will scatter into other hives, and are lost by being killed as intruders. I have had thousands slaughtered by their trying to enter into other hives, and soon learned that it was better to let them go home, than have them killed entirely thru my interference.

Sometimes I would hunt out the queen by smoking the ball of bees till they releast her, when she was caged and placed between the combs, or hung down from the top-bars of the frames, when no combs were used in hiving the swarm. In about half of these cases this satisfied them, while at other times they would ball the cage, so it would do little if any good.

I now secure the queen as before; but instead of using a common round cage I make a large flat one to reach clear across the frames. Into this I put the queen and lay it on top of the frames, when the bees can reach her thru the wirecloth between every frame in the hive, which always seems to satisfy them. The next morning I let her loose and remove the cage.

ROUND PIECES OF WAX NEAR HIVE-ENTRANCES.

"What is the significance of finding in the morning a lot of little round pieces of dirty-colored wax near the entrance of some hives?"

ANSWER.—So far as my observation goes, the finding of such round pieces signifies that drones are hatching out; or, more properly speaking, emerging from their cells; for, if any one will take the time to examine closely, he will find that the drone, when about to emerge from the cell, bites the cover of the cell entirely off by a smooth cut, while the workers leave only fragments of the cappings of their cell-coverings when they gnaw out. The queen cuts off the capping to her cell the same as does the drone, except, as a rule, a little piece on one side is left, which often acts like a hinge to a door, the "door" often closing after the queen has gone out. Where no such hinge is left, then the caps to the queen-cells are tumbled out of the hive the same as are the drone-cappings, but in no case would there probably be more than four or five caps from queen-cells out in front of the hive on any one morning.

If the little door thus closes, as is spoken of above, the bees often make it fast, so that the inexperienced bee-keeper is often deceived into thinking that the queen has not yet emerged from her cell.

Then, again, it often happens, as soon as the queen has emerged from her cell, that a worker goes into the cell to partake of the royal jelly left in the cell, after which the cell-cover flies back, or is pushed back by the ever-traveling bees, the bees then sticking it fast, when the bee is a prisoner, which has caused many to think that the inmate of the cell was not a queen but a worker; hence they call their colony queenless, sending off for a queen, only to lose her when they try to introduce her.

It is well to understand all of these little kinks in bee-culture, as such an understanding will often pay us largely in dollars and cents.

Some suppose that the round caps spoken of by the correspondent indicate the uncapping of cells of honey, either by robber-bees or preparatory to the carrying of the honey from the outside of the hive to the center thereof; but this is a mistake, as the cappings from the honey-cells

are gnawed off in little fragments, and not in the round form spoken of.

VISITING DIFFERENT FLOWERS IN GATHERING HONEY.

"In gathering honey, do bees visit different kinds of flowers on one trip, or gather honey from one kind of flowers only?"

ANSWER.—From the fact that bees never bring in pollen of different colors in their pollen-baskets at the same time, the idea has obtained that they visit only the same blossoms, or blossoms of the same color, which idea in the main is correct, or very nearly so. Regarding this point I will say that, in gathering pollen, I never saw a bee change from one kind of flower to another, except on the clovers. I have seen bees gathering pollen from white, red and Alsike clover at the same time; but those clovers gave the same colored pollen. When we come to honey I have seen bees fly from a gooseberry-bush to a currant-bush, and from clover to raspberry bloom, and *vice versa*. I have also seen them go from the red variety of raspberry to the black, where the different kinds of bushes were planted side by side, or in alternate rows; still, all that does not prove that bees gather honey promiscuously, for I do not believe they do. It will be observed that all of the above, except from clover to raspberry, were of the same species of plants, or nearly so. Teasel and basswood bloom at the same time; but never, in all of my watching, did I ever see a bee go from teasel to basswood, or from basswood to teasel. Onondaga Co., N. Y.

Some Experience of the Present Season.

BY J. C. ARMSTRONG.

I HAVE kept bees for nearly 40 years, and have come to the conclusion that there are more surprises in the bee-business than in any other in my knowledge. Owing to a cranky neighbor I made up my mind a year ago I would divide my bees and have no more swarming. My bees were very light in stores last fall, and I fed some of the lightest of them. When I put them into the cellar I was fearful that some of them would never come out alive, but luckily they all pulled thru, and out of the 10 colonies I suppose I took out about a gallon of dead bees. I had them in confinement 138 days. They all had a little honey, and some of them *very* little. I thought I must feed them a little till fruit-bloom came, nearly every day, and did so all but two of them.

They gathered up considerable during fruit-bloom, but I could not see what they were to get after that till basswood came, as the white clover was nearly all killed last winter, and I had heard it said that the young clover (and there was an abundance of that) would not afford any honey the first year.

They had by this time become pretty strong, but from the outlook I could not think it a good time to commence dividing. But on May 23 they commenced swarming, and took the matter into their own hands and swarmed, and swarmed. But after basswood was over they seemed to let up a little, and commenced killing off their drones. But within the last two or three weeks they have changed their tactics, and this has been the most lively week with me of the season. They seem to be gathering as rapidly as at any time of the season, and from the young clover. They are booming with bees, send off good-sized swarms, and some of them *very* large. There has been just enough honey coming in, in the scarcest time, to keep the queen laying, with plenty of room to spread herself. I am all "at sea" now. I thought two weeks ago that swarms that came off then would have to be fed for winter stores, but I believe they have now as much as some of them had that I put away last fall. Still, they are stronger in bees than those were, and of course will require more.

I have lost four swarms, and have doubled my number. I had one to leave me to-day. It is a question with me which to do, hive them in empty hives, or destroy the queen-cells in the parent hive, and run them back. The one that came out to-day alighted in a place that it was difficult to get at, so I concluded to let it go, consoling myself with the thought that most of them would die off before spring, after helping to consume part of their winter stores. So I put what they would gather from now until the honey season closes, against what they would eat before they die.

I have often thought of a plan pursued by Mr. Hosmer, of Minnesota, some years ago. He claimed a quart of bees as all he wisht to put away into winter quarters, and would

take the combs and shake part of the bees on the ground, claiming that the old bees would shake off and the young bees would stick to the comb. This seems like a barbarous action, but, full as the hives seem now, I believe it would pay.

I have adopted the plan with some of my hives with which I am so well pleased that I think I will follow it generally next year. It is to clip the queen's wings, then when the swarm comes out I set a tumbler over the queen, remove the hive to another place, and set an empty hive in its place, and when the swarm commences to return let the queen run in with them. Or, after the swarm returns, destroy the queen-cells in the parent hive, set it back, empty the bees out in front of the hive, and let them run back.

I would refer the subjects mentioned in this to Dr. Miller for any advice he may choose to give me as a guide to the future. Marshall Co., Iowa, Aug. 11.

From the Egg to the Perfect Bee.

BY H. W. BRICE.

ON examining a cell just after an egg is laid, we find a small white speck standing on end, attach to the base of the cell, and slightly on one side of the apex thereof; it is fixt in this position by a watery, semi-sticky substance which at this period envelops the whole of the egg. Within a few moments, however, one of the nurse-bees enters the cell—head first, of course—and, after a few seconds of activity, withdraws and hurries away to the next cell to "go on" as before.

Now, let us examine the cell again, and we find that the nurse-bee has carefully placed the new laid egg down on its side, and in its orthodox and proper position at the bottom of the cell. The egg from this time forward is a matter of constant care and attention on the part of the nurses, that are persistently examining it, probably to see how it is "getting on."

On the second day we find the bees have shifted its position to an angle of about 35 degrees; on the third it is again moved to a horizontal position, and on the fourth day it hatches out.

This brings us to the question, What is the still undeveloped insect to be? But in any case, whether worker, drone, or queen, we find the young larva lying in crescent shape at the bottom of the cell, and here it rests for some hours almost unnoticed by the bees, and certainly unfed for 12 hours. Then is seen a little transparent food, upon which the larva almost floats. In 24 to 36 hours the food first exhibits a slight milky opacity, and becomes more abundant until about the third or fourth day, during which time the food is absorbed by the mouth and other portions of the body floating upon it, the larva passing no ejections whatever. At the period mentioned and with either worker or drone larva—what is known as the "weaning period" occurs, and for a short time no food is supplied. Then, when nourishment is again necessary, the food is changed, and the rich nutriment previously given—which appears to me to partake of the nature of "royal jelly"—is discontinued, and honey and partly-digested pollen take its place. The worker-larva are fed on this until the end of the eighth day, when the cells are capd over, and after the 21st day the insects come forth from the cells perfectly developed, in the form of brownish-gray little creatures, apparently regarded by the adult workers as hardly belonging to the same community. However, in a very short time the newly-arrived ones are running about the combs, clearly to the "manor" born.

Drone-larva are fed for one day longer than the workers, the cells being sealed over about the ninth day. They do not, however, issue as perfect insects until after the 24th day from the laying of the eggs, both days inclusive.

Bees have the power to prolong the above times, but I have failed to discover that they can shorten the time occupied in the metamorphosis. They have, however, a marvelous power of lengthening the period, instances having come under my notice where worker-larva have been kept at apparently from three to four days old from the egg, until the eighth day, these same cells having been found unsealed on the 12th day. This often happens in queenless colonies.

I have also known drone-larva to remain unsealed for days after the generally-accepted period. The protraction of time in sealing the cells is more markt, however, in the case of queen-rearing. A larva intended for a queen is fed during the first three days on the same partly-digested food

as the worker and drone larvæ, with the important difference that the larvæ intended for queens are fed abundantly with this food from first to last, and are not weaned or stinted in any way or at any period, thus the usual time for a queen to develop is 16 days; viz., the egg hatches on the fourth day; larva fed until the eighth day, when an extra abundant supply of food is given, and the cell is sealed by the ninth day—the perfect queen coming forth on the 16th day.

This is generally the case under normal conditions, but it is not unusual to have whole batches of queens not forthcoming until the 18th and 19th day, sometimes issuing nearly all at one time, and sometimes hours after one another, being almost entirely dependent upon when the cells were respectively sealed.

This power of controlling the development of their young, and the many varied circumstances which affect this question is one of the most absorbing phases of our craft, and is another portion of scientific bee-keeping upon which more light is wanted.—British Bee Journal.

Running an Apiary for Extracted Honey.

BY F. A. SNELL.

I FIND it quite essential to run a part of my bees for extracted honey, as I have quite a number of customers about home who wish their honey in this form, and distant customers as well. The lower price at which it is sold compared with that in the comb, is no doubt the main reason. Another reason with buyers living at a distance is, the safety with which it can be shipped, and the lower freight rates charged for transportation. I wish to be in shape to supply all who want to buy, and can only secure this condition by having a supply of both comb and extracted honey on hand.

It is seldom that any surplus storing-room is needed here until the opening of white clover bloom, early in June. The latter part of May or first of June I have all supers in shape to put on the hives, all being clean, or free from dust, webs, or litter of any kind.

At the opening of the honey-flow from white and Alsike clovers, the upper stories for extracting are put on all colonies strong enough to need them. Perhaps in from a few days to a week later other colonies will need room, which is given. Bees increase very rapidly at this time of year, and their strength and progress are noted once each week, and more room given if required by colonies not supplied with upper stories, until all are given supers.

After work has been well begun in the supers, if the honey-yield be good, the first stories on the stronger colonies should be raised up and a super with complete empty combs placed next to the brood-chamber, and the first one placed at the top. The bees will then have time to complete the first and better ripen the honey before extracting than when the honey is taken sooner. The bees are not then crowded, and more and better honey will in a good season be secured by thus tiering all strong colonies.

As a rule I do not extract from the combs given later when taking the first honey. Very little if any new or thin honey will be in the top story when the extracting is done, but will be next to the brood-chamber.

In five or six days after giving the second stories I empty the first ones given, and the same evening, or next morning after, I place these empty supers under those partially filled on the hives, bringing the latter to the top.

I proceed in the same routine until the close of the summer harvest. About one week to ten days later I extract the honey from all upper stories, and at early evening place the empty supers on the hives for the bees to clean up and care for the combs, which are left on the hives until the close of the honey season, unless the fall flow is so great that more room is required, in which case the honey is removed and combs returned to the bees.

At the close of fall bloom, or soon after, the extracting-supers are all taken off, the honey thrown from the combs, and the supers placed at one side of the bee-yard, tiered up, and the little honey remaining in the combs is cleaned up by the bees, and nicely excluded; thus the supers remain until the next season.

In taking honey from my bees I have practiced the shaking-off and escape plans of ridding the combs of bees when extracting.

In producing this honey I use a queen-excluder over the brood-chamber, which keeps the queen and all brood out of the supers. When I have a large amount of honey to ex-

tract, by the shaking-off plan, three of us work at it. One stands behind the hive with smoker well lighted, with which the bees are kept under control, and out of the way; a frame of honey from one side the hive is taken out, and the bees given a little smoke, when the frame is handed to the second man, who shakes most of the bees off by one or two quick jerks. The few remaining bees are brushed off with a brush made from asparagus tops tied in a bunch, which I like better than those for sale, as I have tried such.

This second man then places the honey in an empty hive-body, which stands on a cart near at hand. The second frame is taken from the hive by man No. 1, and treated the same as the first. No. 2 frees the comb of bees and puts it beside the first frame, and so we proceed until the hive is empty of frames. If the hive is a three story one, the empty body is removed, bees driven down out of the way, and the hive closed.

No. 2 wheels the cart to the honey-room door, lifts off the hive-body and combs, and places it on a bench in the honey-room, raised one inch, by strips, from the top of bench proper.

When extracting from two-story hives, the combs of honey are taken out and the empty body filled with empty combs by No. 1 before closing the hive, No. 2 taking a set of frames empty of honey from the honey-room each time one is brought in full.

Man No. 3 takes out the first frame, uncaps the sealed cells, and places it in the extractor; the second and all other frames in the first hive-body are thus emptied and placed back ready to be returned to the bees.

While uncapping the combs the frames rest on a rack at the top of the uncapping-can, the comb or caps dropping below into a metal basket made of perforated tin. From this the honey drains to the bottom of the can.

From the extractor the honey is run into a pail, and from that poured into a large can covered with a strainer-cloth, which keeps out all specks of comb, bees, flies, etc., if such are present, and the little specks of comb or caps always are. The honey from these cans will run out of the gate at the bottom clear and nice.

Man No. 2 at all times shakes the bees from the combs on an alighting-board just in front of the hive-entrance, and from which they can run into the hive.

The above method is best practiced during a good honey-flow. During a time of scarcity I much prefer the escape plan, of which I will speak later.

Carroll Co., Ill.

Covering the Brood-Frames with Paper During the Season of Cold—Is it an Advantage to the Bees?

BY W. W. McNEAL.

I F there is one good thing that I enjoy above another it is light—beautiful light—be it in the heart or "out-doors."

And I believe I never appreciated it more fully than on Feb. 15, last, when after the clouds had rolled away, the gentle sunlight again reached my little apiary and me. The air became remarkably dry, however, during that time, so much so that when the mercury was 20 degrees below zero, and sometimes lower, the cold did not penetrate to one's very bones like the damp, chilly air we so often experience here along the Ohio River.

My bees were in single-walled hives, with the poorest of stores it had ever been my misfortune for them to have. As day after day past, and the cold did not abate, I could not conceal from myself the fact that my watch over the bees was becoming no less than a death-watch; I was hoping against hope, and when the sun did shine, it was a sorrowful sight to see the bees dragging themselves out of their cold, comfortless hive, with swollen bodies. Doomed they were, as much from discouragement, seemingly, as the effects of poor food and the cold.

Of all this, two things stood out very prominently, namely, that where such extreme cold is, a properly-constructed cellar should be the place for the bees during that time; and that honey-dew—such as we had here last year—is not a winter food for bees. By a lack of warmth-producing elements, it simply overburdens the bee long before the expected time. Honey, good, ripe honey, is the food for bees; having it, I am not afraid of their suffering from confinement to the hive by the cold.

The only extra protection I have given the bees of late years in these hives was several thicknesses of common newspaper placed directly on the frames, the upper ones

projecting far enough over the sides and ends of the hive so that when the super-cover was on, the large telescope cover would press the paper down over the hive for three or four inches, cutting off to a minimum the upward draft.

The frame I use is self-spacing, of the Root-Hoffman style, tho a little shorter and some deeper than the Langstroth frame. I consider this frame better adapted to the wants of the bees than the loose, swinging Langstroth frame, and, since of late the seasons have been so very uncertain as regards the honey crop, I think it best to yield these little conveniences, some of them at least, to the bees.

Now, do you not see that by closing the space between the top-bars of the frame and the space between the end-bars closed part way down, the space between any two combs is, to a large extent, a little hive all to itself? Can you think of a more convenient way of making the hive always fit the colony? If all this were no advantage to the bees, why did my bees fare better than those of many beekeepers who winter their bees in the orthodox way—that of having an air-chamber over the cluster?

I will venture to say, many colonies of bees that died last winter did not die of starvation, because there was no honey-(dew) in the hive, but because the temperature within the hive was so cold they could not reach it. Why not, I say, confine the warmth of the cluster to the frames on which the bees are?

You who claim that it matters not if the heat does escape over into the outside spaces between the combs, even to the sides and ends of the hive, for it is still within the hive, and finally returns to the cluster, do you think the bees recognize the fact? Do you think *you* would, if placed in a like situation? I fear not. When the air-space or bee-space over the frames is used in connection with a thick-wall hive, I know of no better death-trap in which to torture bees, especially when the colony is already numerically weak. They cannot generate sufficient heat to ward off the cold, and the winter sunshine never penetrates the icy walls. A thick-wall hive is all right for a large colony, for they of themselves can keep warm within its walls. There they remain quiet—when the food is right—for the light does not attract them.

The single-wall hive is better down here for weak colonies, from the fact that the sun shines frequently—that is, usually—and the hives warm up quickly, tho these frequent flights the bees take cause the queen to lay too early, which also causes her to fall behind at the very time she should be doing her best.

Scioto Co., Ohio.

The Advantages of House-Apiaries.

BY A. H. DUFF.

I THINK that bees would be more generally kept in houses if those who keep them would try my plan of management. It is true that quite a number have house-apiaries, and quite a good many of these houses are very peculiarly constructed, and many of them of old date. It seems that in the past considerable prejudice existed against keeping bees in a house, and house-apiaries seemed to be discarded. I think the feeling originated because of structures that were not suited to the purpose intended. I know that some such buildings were very peculiarly and very expensively built, and filled with all manner of ventilators, slides, shelves, and tiers of hives. They were very long, narrow buildings, and certainly disgusted the writer with house-apiaries.

I have used two kinds of houses for bees that I like. One was on a small scale, and the other on a larger one. In the first place, I consider the expense of such things, and adopt something that is as cheap as possible, yet something that will answer the purpose for which it is intended. Perhaps I do not put on quite enough style, but if I cannot make bees bear their expense and give me a profit that will pay me for my attention, I will quit the business, and also stop writing about them.

To get about all the benefit of the house-apiary on a small scale, we construct a house that will accommodate 10 colonies of bees at about the same expense that it would cost to make 10 chaff hives for these colonies. A small house 6 feet wide, 10 feet long, and 7 high, will cleverly accommodate 10 colonies, and give good working-room, besides leaving at the end ample room for an extractor. By using two tiers of hives, which is done in most house-apiaries, it would double the number of colonies. But here I will say, that after trying the plan of two tiers of full colonies in a house, either large or small, I have totally abandoned it.

I do not want full colonies except on the floor, and for the second tier we can conveniently place nuclei for queen-rearing. In these small houses I would only use floor space enough to set the hives on each side, and have a ground floor thru the center to stand on while working with them. In some respects these small houses are preferable to large ones, as they can be made portable and so arranged in an apiary that bees never become bothered in finding their way to the hives, as is the case with those long house-apiaries. They are also very convenient to winter in, as loose chaff may be well packed about the hives, and the house may be half filled with it. As a wintering arrangement they are superior to any chaff hive, and, as I said above, they are just as cheap, if not cheaper. A house of this kind may be made and painted nicely at a cost not to exceed \$10, or one dollar for each hive.

On a large scale I have an ordinary cottage-house of two rooms, accommodating about 40 colonies, using but one tier of colonies on the floor, and on the second tier above I use nuclei for queen-rearing only. This on account of giving more room, I like still better than the small house, and as for shape and convenience, I prefer an ordinary room or rooms, in preference to anything else. I set the hives on an ordinary bottom-board, about four inches from the floor, setting them back from the wall about three inches, thus giving working-space, and room for packing in the winter. Any house of ordinary construction, one that may simply break the wind and turn the rain—a floor is not a necessity—will answer all the purposes of a modern house-apiary. A building of the size of the above, or larger if required, and a number of the small houses as described, would be my ideal apiary.

The advantages of having bees in a house are many. There is not a day in spring, summer and autumn, but you can perform any work with them desired. Hives, supers and fixtures generally, need not be made and painted so as to stand the outside weather, which would add to the cost materially. All of these fixtures will last much longer by keeping them out of the weather, and will remain in proper shape that will allow of their adjustment to the proper place. Bees are much easier worked with in a house, as they seldom attempt to sting. No bees are flying about when you are at work. No robber-bees bother when you open the hives. Feeding is a pleasure. In extracting there are no bees following you around to get a taste. If you happen to get a few bees inside, darken the windows, and by thus throwing the rooms in darkness, and with a few little holes or cracks that will admit the light, the bees will make for them at once, go out, and in less time than I can write this they will all be outside. Of course you want bees-escapes at the windows, which will ordinarily let them out.

During the honey season, which occurs in the hottest time, the opening of hives and the handling of heavy combs of honey are always done at more or less of risk when out in the hot sun, and must often be done at quite a distance from the extractor. In the house, the extractor sets in the center of the room, and it is but a step or two to the hives, as they are all about the same distance away, and only a part of the combs need be removed at a time. In queen-rearing, and introducing queens outside, we often lose valuable queens; the queens fly from the combs which we are handling, and fly away. This does not occur in the house. There is also no melting down of honey-combs in excessively hot weather, as in the case of hives out in the sun. The advantages of fixing them up for the winter, and their chances for wintering better, are equally great.—Agricultural Epitomist.

Pawnee Co., Kan.

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

The Premiums offered on page 587 are well worth working for. Look at them.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Getting Straight Section-Combs—Italians and Red Clover.

1. How can I get nice, straight combs, of a uniform size, built in the sections? Some of my sections of honey weigh $1\frac{1}{4}$ pounds, while others only weigh $\frac{3}{4}$ of a pound.

2. A neighbor told me he didn't like the Italian bees, for they were poor honey-gatherers, but good breeders. Is that a fact?

3. Is it a fact that there is a strain of Italians, or any kind of honey-bee, that has a proboscis long enough to gather honey from the large red or mammoth clover?

4. When is the best time to sow Alsike clover seed? I have just seeded $\frac{1}{2}$ an acre, and scattered lots of Alsike seed around my sloughs. Did I do right? MINN.

ANSWERS. 1. Use the small boxes or sections in common use, and have separators between them. There will be a little variation in weight, but no such variation as you mention.

2. I keep bees entirely for gathering honey, and I try to keep them as nearly pure Italians as possible. There are many others like me.

3. As a rule, hive-bees do not store from red clover, but sometimes they are known to do so, either because at times the flower-tubes are shorter than usual, or for some other reason. There have also been reported strains of Italians that work much more on red clover than the average.

4. Sow Alsike at the same time red clover seed is sown in your region. It was very likely a waste of a good part of the seed to sow in August. If it does not come up till next spring a good share will be lost.

A Case Where Queens and Bees Died.

About the last of July, 1898, there came a little boy into the shop saying the bees were swarming. So I went out and stood and lookt at them a few minutes, and the bees began pouring out of another hive, and another, and so on, till it went as high as seven. They clustered in regular form all together. I tried to get them to go into two hives, but did not make it work. They all wanted to stick to one hive, altho it was more than full. They appeared to work all right, as I watcht them for a day or two. I did not examine them till sometime the first of September, when I saw that they were very heavy. In November, when I put them up for winter, on examination I found the hive as full as it could conveniently be of good white honey, no signs of brood, and not a live bee in the hive, and only about a handful of dead ones. The honey was all capt in good shape, perhaps 15 or 20 cells being filled with pollen. I have handled bees for 40 years, but never saw the like of this before. MINNESOTA.

ANSWER. The queens were all killed, and the bees stored honey until they died off from old age. No brood being reared, the combs all remained white. That's about the whole story.

Position of Winter Stores in the Hive.

The wintering of bees is an unsettled question for me yet. I lost over 50 percent of my bees in chaff hives last winter.

Where is the place to have the winter stores? Would it be best above, or on one side, or on both sides of the cluster? My bees had plenty of stores last winter. The brood-nest was in the center, the bees moved to one side for food, ate it all up, and then starved, while on the other side

were 3 to 4 frames full of sealed honey. I thought to fix the hives, or bees, like this: Winter stores on one side, and bees on the other side, then the bees would go towards the center of the hive, until about January, the coldest time, they would always move towards their stores. PAOLI.

ANSWER. Left to themselves, you will probably find that bees will always do as yours did, and store the honey at both sides, having the brood-nest in the center. One would think that bees know their own business best, and know just where to store their winter stores for safety. But your experience appears to contradict this, and your experience is that of many others. We must remember, however, that in a state of nature bees don't have their homes in a hive shaped like yours. The old straw skep of our forefathers comes nearer the mark. In that the stores are not on both sides, nor all on one side, but above. That's the best place for winter stores, and if we are building for the bees alone we will have our brood-chambers shorter, narrower, and deeper. But for our own convenience it is much better to have them the shape they are. You have struck the right idea in thinking that it is better to have the honey all at one side, since it cannot be all on top. Then there will be no danger that the bees will be stranded on one side with plenty of stores lying idle on the other side.

Comb Foundation in Section Honey.

Is there any way of producing comb honey without the thick mid-rib with the use of full sheets of foundation? I purchast, last spring, sufficient foundation, supposed to be "extra thin," and filled sections with the same. The results have been perfectly satisfactory with the exception that a number of my customers complain of the amount of wax in the honey, and so I seek information, to know if you, in your experience, have any remedy to suggest. The use of starters suggests itself, but the product is not as perfect nor as pleasing to the eye as the section with the full sheet of foundation.

Many small bee-keepers in this locality complain of the poor yield, and no doubt are justified in their complaints, many having nothing to show in the way of surplus from new swarms. CONNECTICUT.

ANSWER.—I know of nothing better than to use thin or extra thin foundation. Isn't it just possible that some of your customers are a little hasty or prejudiced in their judgment? When extra thin foundation is used in a good flow of honey, it is somewhat doubtful whether any one could tell it from the natural product. Indeed, some of the foundation now made has a base that is thinner than the natural base.

Questions on Brood-Frame Arrangement.

1. Is there any objection to using the Langstroth-Simplicity brood-frames if I make my hives so long as to place the brood-frames just level with the top of the brood-chamber, instead of placing them on top of the rabbets? Will the wide space that will be left on each end of the frames, between the end-bars and the end of the hive, do any harm?

2. How far apart shall I space the brood-frames so as to have just the right bee-space? And will not the half of the spacing that is between the center frames do between the last frame, that is, the frame next to the side of the hive? or should they all be spaced alike?

3. How much honey will a Langstroth-Simplicity brood-frame contain when well filled?

4. Which brood-frames are most proof against propolis? Are the self-spacing all right?

5. Can I use the Simplicity brood-frames without any spacer strip on the bottom-board? I wish to notch down the top-bar's only, and let the frames hang loose, if this will work all right. MINNESOTA.

ANSWERS. It isn't easy to understand clearly just what all your questions mean, but it may be said in general that very many changes and variations of the Langstroth hive have been made and rejected, and the probability is that unless you have had a long experience any change you may make will do more harm than good. But answering your questions as fully as possible:

1. I don't know of anything you would gain by having the top-bars level with the sides and ends of the hive, and whatever is placed over the hive would have to be specially adapted to the change. If you have more than $\frac{1}{4}$ or $\frac{3}{8}$ of an inch between the end-bars and the end of the hive, the

bees will build comb in the space, and that will be in the way of handling the frames.

2. Perhaps the majority space their frames $1\frac{3}{8}$ from center to center, altho some prefer $1\frac{1}{2}$. There should be about the same space between the outside top-bar and the side of the hive that there is between the top-bars.

3. Perhaps somewhere from 5 to 7 pounds.

4. It depends upon the kind used whether self-spacing frames are all right. The worst frames as to propolis that I ever used were self-spacing, and those that gave the least trouble were also self-spacing. If the spacing depends upon having a large part of the frames come in contact with each other, then there will be trouble with propolis in a region where propolis is plenty. The least trouble is with frames that have very small points of contact, as when common nails are used for spacers.

5. Yes, probably most loose-hanging frames have no spacing strip. But you can hardly have anything like exact spacing at the bottom if the frames hang entirely free.

Keeping a Caged Queen.—Editor Hutchinson, of the Bee-Keepers' Review, says she may be left for days laid at the entrance of any populous colony during the working season, and the bees cluster over the cage and care for the queen just the same as tho she were inside the hive.

Wood versus Wire.—In the Australian Bee-Bulletin the question is asked whether splints of wood have been tried in place of wiring, and with what results. One man says he has used the wood with much satisfaction, another intends to try it, the remainder have no experience, and one of them thinks it "best for poor bee keepers to keep on well beaten tracks."

Automatically Reversible Honey-Extractors, Editor Hutchinson, of the Bee-Keepers' Review, found used by several Wisconsin bee-keepers, but they ignored the automatic feature, stopping the machine and reversing by hand. The reversing in motion results in a shock which may injure new combs, and it is hard on the muscles of the operator. The Cowan reversible, as now made with a brake, he thinks the most desirable extractor on the market.

For Safe Handling in Shipping, Editor Hutchinson, of the Bee-Keepers' Review, says he saw the following printed in enormous letters and pasted on the tops of crates:

"DO NOT TIP OR TURN OVER.

THIS IS THE TOP OF THE CRATE, NOT THE BOTTOM. IF HANDLED ROUGHLY THERE WILL BE DAMAGES CLAIMED FOR BREAKAGE."

Mr. Hutchinson thinks something like this on crates of honey *might* be heeded by freight-handlers. Possibly, however, it might be heeded as much if a little more in the way of a request, and not so much in the way of a threat.

Source of Honey-Dew.—John Handel, while admitting that it is possible that "plants under certain atmospheric conditions exude a sweet juice from the surface of their leaves," says that under very careful observation he has never seen anything of the kind, and gives the following as a reason why observers, otherwise careful, have been misled: The spray as ejected by the aphides is so fine that a slight breeze will carry it quite a distance. It sticks to anything with which it comes in contact, and absorbs moisture to such an extent that a small particle will spread over a large surface, and still leave a film when it dries. A single drop may start near the top of a tree, and drip from leaf to leaf, while wet, and leave a gloss on each leaf.—Bee-Keepers' Review.

Safe Introduction of Queens. G. M. Doolittle gives in the American Bee Keeper a plan he has followed many years with very rarely a failure, which, altho it has been given before, will bear repetition: Take a piece of wire-cloth, 8 inches long and 5 wide. Cut an inch square out of

each corner, and bend up at right angles the sides and ends. That makes an open box 6 inches long, 3 inches wide, and an inch deep. Unravel the wires a little more than half way down. Remove the queen to be superseded, shake the bees from the comb on which she was, place the new queen upon it where there is hatching brood and honey, press the wires of the cage into the comb till the unraveled part strikes the surface, put the comb in the hive, and leave $\frac{1}{4}$ -inch between it and the next comb, so the bees can travel all over the cage. In a day or two—or as soon thereafter as the queen has laid some eggs—quietly lift off the cage, and all will be well.

Temperature for Brood-Rearing. In Gleanings in Bee-Culture G. M. Doolittle gives an interesting account of experiments made with a thermometer to ascertain the proper temperature for brood-rearing. On a cool night in May, when ice as thick as a window-pane formed on water, he found the lowest point reached in the brood-nest was 92°. Repeated experiments with strong and weak colonies never showed a lower temperature of the brood-nest, while some of the stronger colonies gave a temperature of 95° on nights in which there was some frost. On the hottest days he found a self-registering thermometer showed 98° as the highest point reached. So he concludes that whatever favors holding the temperature somewhere from 92° to 98° is favorable to brood-rearing. To this end he likes a chaff-packet hive with a metal roof, all painted dark. The hive is allowed to stand in the sun to get its full benefit till steady warm weather with large population, when a shade-board protects against the hot sun.

Sections Sealed Next the Wood have been considered desirable, and in grading comb honey such sections have taken a higher place. Lately, however, the idea has been advanced that a section is preferable which has no honey in the cells next the wood, not having the dauby appearance of one with honey leaking all around when cut out. A Stray Straw in Gleanings in Bee-Culture says:

"Tastes differ. Mr. Niver and other New Yorkers like to see on a plate a section of honey that is nice and dry, because no cells are filled next the wood. To me it looks far more luscious if the cut cells show, and it is surrounded by some of its own rich gravy."

To which Editor Root replies: "When Mr. Niver presented his view I was inclined to think he was right; and now you have presented your notion, I have flopped again. There is no denying the fact that a chunk of dripping crystal honey has a sort of lusciousness about it that makes one's mouth water. A chunk of comb swimming in its own crystal sweetness reminds one strongly of the good old days gone by, and of how our fathers and grandfathers used to dish out honey in great chunks smeared in its own rich gravy."

Giving Swarms to Nuclei. The critic of the Bee-Keepers' Review, Hon. K. L. Taylor, refers to page 371 of this journal, where "Doolittle criticises Dr. Miller sharply," commends the response of the latter, but says he failed to reply to one point, "the method of giving swarms with nuclei." Mr. Doolittle gives as the only safe way, the advice to set the nucleus on the stand of the swarming colony, smoke its bees, and as the swarm begins to return without its queen, which has been removed, shake the nucleus 12 to 18 inches in front, letting them run in with the swarm. Without this precaution the bees of the nucleus would, in nine cases out of ten, kill the bees of the swarm as fast as they came back. Mr. Taylor is surprised at this, having never found it necessary during swarming time to use any such care. Recently he has had considerable experience directly upon this point. For certain purposes he had formed a number of nuclei with virgin queens, and says:

"The hope of surplus having past, and bees in the shape of swarms being superabundant, I have dumped many in front of these small colonies, without ceremony, and let them run in. In no case was there any quarreling. In all my experience in such cases I have only deemed it necessary that the invading bees should be in considerable numbers and without a queen; and if of a prime swarm, that the queen of the nucleus should be fertile."

Then he hints that "locality" may have something to do with the case. It might be well if Dr. Miller would break silence on this point long enough to tell us whether he has had direct experience upon it, and if so, whether his "locality" is like that of the New York or the Michigan man.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. SEPTEMBER 14, 1899. NO. 37.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

At Chicago in 1900.—The Philadelphia convention of the United States Bee-Keepers' Association closed Thursday, Sept. 7, after a very interesting and profitable meeting. The election of officers, constituting the Executive Committee for 1900, resulted as follows:

President—Ernest R. Root, of Ohio.
Vice-President—G. M. Doolittle, of New York.
Secretary—Dr. A. B. Mason, of Ohio.

It was decided to hold the convention next year in Chicago, where will be held the annual encampment of the Grand Army of the Republic.

Now for a bee-keepers' convention of at least 500 in 1900. The old American Bee Journal extends a hearty invitation to every bee-keeper in the whole country to attend the Chicago convention of the United States Bee-Keepers' Association next year. The exact date will be announced later.

Last Winter's Losses of Bees are attributed by F. Greiner, in the American Bee-Keeper, to bad food. Chaff-packing seemed to make but little difference. Apiaries on the summit of hills suffered more than those in valleys. Locality seemed to have much to do with the loss, one yard being entirely wiped out, and another two miles distant coming thru without loss. As bearing directly on the matter of food, he says:

"Last fall I made mention of the soured honey some colonies had stored in the sections, and I have reason to believe now, had all colonies stored such honey in the supers, we would not have suffered the loss in bees that we did. It

would seem that at the time when the flowers yielded this inferior honey, part of the colonies stored it in sections, others in the brood-nest; some of them, perhaps, in outside combs, and others again, exactly above or very near where they took up their abode during the winter. These last ones were undoubtedly the ones that succumbed.

"This theory would also serve to explain the mystery why part of the colonies came out so well when others did not, apparently all having equal chances. Another circumstance seems to favor this view. A number of my colonies which were fed heavily till late in the fall on honey from a preceding year—feeding them for the purpose of having section honey finish up—came out in fine shape, every one of them! I have also referred to the fact already that the colonies which stored the soured honey in the sections came out all right."

Washington Pure Food Law Rulings.—In the Northwestern Horticulturist of recent date we find the rulings of the Washington State Dairy and Food Commissioner, E. A. McDonald, of Seattle. His ruling on honey—which is of particular interest to bee-keepers—is this:

HONEY.—Must be pure. Cannot be mixt with glucose or other substances and sold as "Honey Compound."

That is sufficiently explicit so that no one need be in the dark as to what kind of honey to put on the market in Washington—simply, it "must be pure."

The Anti-Adulteration Sentiment seems to be growing. It is high time that it should, for the investigation of food products made by Senator Mason's committee some time ago here in Chicago resulted in many startling and alarming revelations. The people are simply being financially defrauded and physically ruined by the villainous adulterations put on the market. Something must be done, and that right soon, to stop the onward course of the hydra-headed monster of food adulteration. We believe that Congress will act promptly and effectually when it once hears the report of Senator Mason's committee.

We were greatly pleased to read in the Saturday Evening Post—that splendid Philadelphia weekly magazine—the following editorial, which has the true ring, and which we of course heartily endorse:

PROTECTING THE NATION'S HEALTH.

If a merchant make large profit out of short weights and measures and adulterated goods, it does not add to his value to the community to have him a generous leader in religious and philanthropic enterprises. He is simply robbing the foundations of principle and character to purchase a temporary public prominence, and his influence is doubly evil because he constantly tempts his competitors to illegitimate expedients, and vitiates reputation by forcing himself forward as an example of dishonest gain purchasing position and respectability. Even when this successful man—successful from the financial standpoint—leaves a million or two to found an institution with his name emblazoned upon it, the usefulness of the enterprise is poor atonement for the viciousness of his business life. It cannot mitigate the effect upon every young man starting out in life who beholds in the benefaction an incentive to conscienceless money-getting.

If this merchant were to eat his adulterations himself, or even if he should feed his family upon them altho he would hardly be as inhuman as that we might excuse him on the point of personal liberty, and he and his might go to their indigestion and pepsin tablets and early graves in their own unhappy way. But when he imposes upon innocent customers, and fills their bodies with unhealthy chemicals, and clothes their backs with false pretensions, and takes their money for things that are not as they seem, he is not only a thief, but a public enemy, who poisons the very currents of trade. It goes further than this; if he is allowed by the other merchants to continue his nefarious traffic without a heroic endeavor on their part to stop it and punish him, he becomes, and his methods become, a criterion by which they are judged.

As it is with individuals, so it is with the countries, and the United States is beginning to reap some of the results. Never was adulteration as great in this country as

now. Never was it so ably defended by every resource of cash and counsel. For years it has multiplied in private ways—individual crimes here and there—until it has networked the country, and, having grown bold on its millions, feels itself strong enough to combine against the morality of business and the good name of the nation. There is no question whatever about the facts. The Congressional committee has collected a mass of them. Reputable journals have exposed them time and again. Chemists possess vast quantities of testimony. Foreign governments have taken cognizance of the matter to the injury of American reputation in every corner of the globe. We blame our friends across the sea for absurd restrictions upon our trade, and yet we allow as fine a lot of swindlers as ever lived outside of prison walls to ply their trade unhampered. From embalmed beef that poisoned the troops to condensed milk that kills the babies, the whole gamut of criminality is run.

It is not enough to say (and the statement is perfectly true) that the great mass of American producers and merchants are honest. The fact which compromises all is the impunity with which the adulterators are allowed to do their work, the liberty with which the sellers of adulterated goods are permitted to cheat the public. It is necessary not only for the safety of our own people, but for the interests of trade itself that the honest man fight the dishonest man, that they free themselves from the charge that they condone the crimes by allowing them, that they use the means best adapted to the end—a stringent national law.

In some of the States there have been measures of one kind or another in this direction, but they have mainly led to much litigation, and the evil has prospered. Now the time has come for Congress to act, and the whole moral sentiment of the country, with the united support of the press and business office, should aid the measure that is more necessary to the public health than a quarantine law, and which is absolutely demanded by our commerce if we expect to hold our own in the markets of the world.

LYNN ROBY MEEKINS.

The Nebraska Bee-Keepers' Association will hold its annual meeting at York, Nebr., Sept. 20 and 21, 1899, in connection with the horticulturists. We notice on the program are the following:

Address, Nebraska Bee-Keepers' Association—Pres. E. Whitcomb.

Practical Bee-Culture—E. Kretschmer, of Iowa.

Sweet Clover for the Farmer—Wm. Stolley, of Nebraska.

Fruit and Bee-Keeping Combined—G. M. Whitford, of Nebraska.

There will also be general discussion of questions of interest to all concerned. Of course everybody is invited to attend. Mr. L. D. Stilson, of York, Nebr., is the secretary of the Nebraska Bee-Keepers' Association, and will be glad to furnish any information.

MR. J. D. GIVENS, of Dallas Co., Tex., writing us Aug. 29, said:

"The honey crop is a total failure here—not one pound have I taken this season."

MR. L. O. THOMPSON, of Addison Co., Vt., wrote us Aug. 28:

"I have 650 colonies of bees, and not one ounce of surplus honey. This season is the worst ever known in Vermont."

THE RELIABLE INCUBATOR & BROODER CO., of Quincy, Ill., is one of the most successful concerns in all this country. Their 20th Century Catalog is before us a little over a year in advance of the appearance of the new century. But there's nothing like being prompt, you know. This fine catalog has 160 pages and cover, and contains a wonderful

amount of poultry information. It is also well illustrated. Better send for a copy of it, at the same time mentioning that you saw their advertisement in the American Bee Journal.

MR. G. W. LOGAN, of Camden Co., N. J., had the honor of having the Philadelphia Bee-Keepers' Association meet at his home Saturday afternoon, Aug. 12. The principal topic discussed was the convention of the United States Bee-Keepers' Association in Philadelphia.

PROF. CHAS. HERTEL, superintendent of schools of St. Clair Co., Ill., had the misfortune to lose a driving horse Aug. 19, it being stung to death by his bees. He wrote as follows to Mr. E. T. Flanagan, of the same county, who forwarded the account to us, saying that it might save some one else from a similar loss:

FRIEND FLANAGAN: This morning one of my black driving horses ran away while I was trying to get into the buggy. She ran into the bee-yard and upset half a dozen hives and hung with the buggy to a plum-tree. The bees soon literally covered the animal. We finally secured her after she had thrown herself to the ground. She squealed in her agony, and was dangerously frantic after we had rescued her. We could not quiet her until she was exhausted, when we gave her several doses of whiskey. However, she died in agony at 10 o'clock this morning. My son and myself are nearly sick from the effects of numerous stings.

CHAS. HERTEL.

In reply to the above, Mr. Flanagan wrote thus to Prof. Hertel:

FRIEND HERTEL: If you and your help had dasht buckets of cold water *at once* on the bees and horse, and, after getting her loose, had continued to pour cold water over her, in all probability you would have saved her life. Cold water, when readily accessible, is one of the best agents in the world to subdue bees when on the rampage, as in this case. I sympathize with you, Friend H., but don't forget the cold water next time; and don't give any whiskey.

E. T. FLANAGAN.

LADY HENRY SOMERSET is always a prominent figure at the meetings of the International Council of Women, especially when they are held in London. On such occasions her place—the Priory—is thrown open to the American delegates and their friends. It was at a tea in the Priory during the latest London meeting of the Council that Lady Henry told how she came to devote a large part of her life to slum work among the children. Lady Henry, by the way, is almost as well known in this line of effort as she is in Women's clubs and British temperance work.

"It was this way," she said. "I was moved in that direction by the rare patience and imagination of one little boy. His example convinced me that patience was one of the qualities I needed most, and in seeking it I grew into that work. I was in a hospital on visiting day, while the doctors were changing a plaster-cast which held a crippled boy's limb. The operation was exceedingly painful, I was told, yet to my surprise the little sufferer neither stirred nor winced, but made a curious buzzing sound with his mouth. After the doctors left I said to him:

"How could you possibly stand it?"

"That's nothin'," he answered; "why, I just made believe that a bee was stingin' me. Bees don't hurt very much, you know. And I kept buzzin' because I was afraid I'd forget about its being a bee if I didn't."—Saturday Evening Post.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

Two Things to Remember. Please don't send to us for sample copies of other papers we have only the American Bee Journal at this office. Also, whenever sending us a copy of a local paper which contains something you wish us to see, be sure to mark the item in some way. We haven't time to read a whole newspaper thru in order to find a small item occupying perhaps an inch or two of space. We are always glad to receive papers containing anything that you think might interest us, but we want them marked.

Root's Column

WANTED HONEY

Have you any to sell? If so, write us at once giving full particulars and be sure to state the lowest price you will take. If you want any part of the payment in bee-supplies, please state this also. Do not fail to say from what source it is gathered and how it is put up.

HONEY FOR SALE.

A good many bee-keepers buy of us when their crop is short as they have a local trade they want to hold. We have secured some nice lots, especially extracted, so write us if you want to buy.

New Edition of the
A B C of Bee-Culture
Ready Sept. 15.

Watch for our Column Next Week.

ADDRESS

THE A. I. ROOT CO.
MEDINA, OHIO.

In the multitude of counsellors there is safety. Prov. 11 14.

Spraying Fruit-Trees While in Bloom

Query 103. As the spraying of trees and vines while in bloom has caused much destruction of bees and great loss to bee-keepers, should an agitation be inaugurated for its suppression? FRUITER.

- P. H. Elwood—Yes.
- Adrian Getaz—Yes.
- Mrs. L. Harrison—Yes.
- R. C. Aikin—Yes, sir-ree.
- Mrs. A. J. Barber—Yes, decidedly.
- J. M. Hambangh—Yes, by legislation.
- C. Davenport—Most certainly, in my opinion.
- J. A. Green—Yes, we should have laws that will protect the bees.
- O. O. Poppleton—Yes, if that is the best way to suppress the practice.
- C. H. Dibbern—Yes, because it is not the right time to spray, regardless of the bees.
- E. France—If my neighbors sprayed during fruit blossom I would talk to them about it.

Chas. Dadant & Son—This has already been done enough to discourage the practice by progressive men.

Prof. A. J. Cook—Most assuredly. Especially as it would be unwise if there were no bees to be injured.

Dr. J. P. H. Brown—Correct knowledge of "the time" to spray should be agitated, and disseminated among fruit-growers.

G. M. Doolittle—York State has so "agitated" and "inaugurated" that we have a strong law against spraying while fruit-trees are in bloom.

Emerson T. Abbott—Yes, sir! As it is an injury to the fruit as well as the bees, the fruit-grower should be taught this as quickly as possible.

Dr. C. C. Miller—Where have you been that you haven't known that the agitation was inaugurated long ago, and many States have laws for its suppression?

D. W. Heise—Certainly there should be agitation. Every State and territory in America should pass a law prohibiting the spraying of fruit-trees while in bloom.

Eugene Secor—Yes, but the sprayer must be convinced that it does no good to spray while trees are in bloom, for nine times out of ten he doesn't care a fig for your bees.

E. Whitcomb—Get in close touch with your horticulturist, and convince him that in spraying while in bloom he injures his prospect for fruit, and loses his time and material used. Trees cannot be sprayed

4,000 Pounds
is the guaranteed capacity of this wagon.
It is equipped with
ELECTRIC STEEL WHEELS
with stagger oval spokes, broad tires, etc.
It has angle steel bumpers front and rear. It's low down and easy to load. One man can load it; saves an extra hand in hauling corn fodder, etc. A pair of these wheels will make a new wagon out of your old one. Send for free catalogue and prices.

with water when in bloom without injury. Note how the bloom partially closes to protect the pistil and stigma on approach of a storm. After blossoms have fallen, and before the fruit turns down, is the opportune time for spraying.

J. A. Stone—I think it would be useless, as horticulturists are finding out that it does no good to spray till fruit is out of bloom, and is a great waste of material.

A. F. Brown—Not living in such a location, and not knowing personally the exact extent of such loss to bee-keepers, I cannot say what would be just to every one concerned.

R. L. Taylor—There is no advantage to the fruit grower in spraying trees, etc., in bloom, therefore there should be a law against doing so with any material poisonous to bees.

W. G. Larrabee—As the spraying of trees is very beneficial to the trees and fruit I do not think bee-keepers should try to suppress it, but always advise spraying before and after bloom.

Dr. A. B. Mason—No: the agitation has been "inaugurated," and it ought to attend "strictly to business" till every State has a law prohibiting spraying while trees and vines are in bloom.

G. W. Demaree—Bee-culture is a rural pursuit that is as much entitled to protection by the laws of the State as is any other rural interest. There is no use of

"agitation." The law makers of the State will generally listen to facts, if intelligent bee keepers will furnish the facts to them. Go to it in a business way.

J. E. Pond—As I do not believe that any good results come from spraying blossoms. I think in the interest of apiculture some means should be taken to prevent the practice of so doing, where it exists.

Rev. M. Mabin—There should certainly be an amount of agitation that will suppress spraying fruit-trees when in bloom. But I think it is pretty well suppressed. It is very generally understood that spraying when the trees are in bloom does little if any good.

S. T. Pettit—We have a law, in Ontario, Canada, prohibiting the spraying of fruit-trees while in bloom. It is not a law covering Canada, as one writer has stated. Every State and Province, I think, should have such a law. But it should not require much agitation to secure one.

Mrs. J. M. Null—Rather a school of instruction as to when it should be done. The ignorance on this question is without parallel. What with the country flooded with oily-tongued spraying-machine agents, all intent on turning a penny, the extent of the evil to be apprehended is incalculable.

E. S. Lovesy—Yes, decidedly. All interested should thoroughly understand this matter, and not "go it blind," as many are now doing. Many have drenched their trees, not only destroying the bees but destroying the fruit also, by washing the pollen out of the blossoms, thus throwing their time and money away, as there are no moths or eggs present when the trees are in bloom. While the trees will blossom at a less temperature than 60, the moth will not hatch at a less temperature than 60, and if they are hatched artificially they will not lay their eggs at a less temperature than 60 degrees. This can be proven by taking the larvae and hatching them in the hot-house in early spring. Farther south the difference may not be as long, but here in Utah the trees come into bloom the last week in April, but no hatch larvae are ever around before June 10 to 20, and as eggs hatch in a week, and any one can find them less than 48 hours later boring into the fruit, this proves that the eggs are not laid for five or six weeks after the trees were in bloom. Thus June is soon enough to commence spraying, but to obtain success the spraying must be kept up till about the first cold storm in September.

A Good Report.

I have an increase of 21 colonies from 32 in the spring, making 53 now, and have taken 1,600 pounds of extracted honey, with about 100 pounds of comb honey. I used mostly queens for my increase, buying 14 and rearing the rest. There is plenty of white clover where I live.

I move my bees every fall to the Illinois bottoms. It is 10 miles. I will move them next week. I think we will have a good honey harvest down there this fall. I use ventilators when I move the bees to keep them cool. I move them on a spring-wagon, 10 colonies to a load. I put a frame over the top of the wagon bed, and carry 10 without any trouble. I have moved them now for six falls, and never lost a colony.

JAMES GROVER.

Brown Co., Ill., Aug. 2.

Bees with Crooked Combs.

Can we not find some substantial way to handle our bees so that we can get enough honey and money to pay the printer? There is nothing in it this year, surely. Not that the bees got no honey—they would

Don't fail to mention the Bee Journal when writing advertisers.

simply swarm out when they pleased, and are getting worse every year. I suspect that I have been breeding up this strain of bees!

I have made all my increase from colonies that would swarm out by saving all the queen-cells. I am going to stop this way of keeping bees, right now. I want to rear all my queens from some queen that does not want to swarm out—if I can breed it in, I surely can breed it out.

Here is my way of getting rid of a cross colony with crooked combs, or combs that cannot be lifted out of the hive: Set an empty hive on top of the colony, then go to some hive and get frames of brood and put into the empty hive. In 2 or 3 days the queen will be in the top part. Set the top one off on a bottom-board, and carry it off to another stand, then kill her, or clip, as you like. This will answer the question on page 535, concerning cross colonies. Then if you want to, let a young queen run into the old hive after 5 days. C. CRANK, Osceola Co., Mich., Aug. 28.

No Honey Because of Drouth.

We have had a hard time with the bees this year—no honey on account of the drouth in the spring; however, I think I will come out whole. I had 14 colonies to begin with, and now have 30, and a little over half have some surplus—about 600 sections, and about 24 brood frames, with an increase of 16 colonies. So much for a hard year. I think all will have a living, as they are gathering a little from cotton bloom. Ellis Co., Tex., Aug. 29. R. H. HARKEY.

Bees Preparing for Winter.

Here in southern Kentucky the honey-flow did not commence until Aug. 10, and to day bees are storing honey nicely, but it is of very poor quality, both in taste and color. If the honey flow lasts 10 or 15 days longer, good colonies will store enough to winter on, and give some surplus. But the bees seem very much inclined to store honey in the center brood comb as fast as the young bees leave their cells. The field-bees go right about filling the cells with honey and pollen, which seems as if they were preparing for winter.

H. B. LAMBERT, Simpson Co., Ky., Aug. 26.

Queen Fertilized Seven Weeks Old.

I have never seen it reported in the American Bee Journal that a virgin queen was caged for about seven weeks, and after her liberation was impregnated. Such happened in our apiary this summer. I will tell how it happened.

The first week in June a swarm issued from hive No. 7; it was hived, and out of the parent colony all queen cells were carefully removed. This was repeated until all chances of rearing their own queen were lost, as I did not want any of that stock. Then I put a virgin queen in a cage, and placed her between the frames (this queen emerged from a cell which I had previously taken from some other colony) to be set at liberty in a day or two, but that day or two was past about seven weeks, as it had slipped my mind, that a queen was caged in that hive.

On July 30 I said to my brother, "I must look in that hive, for the colony seems to be getting weaker every day." When the cover was removed I beheld the seven weeks forgotten queen still alive; and before setting her free the hive was again overhauled, and no other queen could be found, neither brood nor eggs. Then I pulled the stopper out of the cage, and she walked in just as limber and elastic as the best of queens.

Then the question was, Will she be all right yet to leave the hive and meet a drone? The hive was closed, awaiting results.

On Aug. 1, my brother and I went to the hive to investigate. It was about 5 o'clock in the afternoon, and a queen was soon found, and with unmistakable signs that cop-

EVERY BEE-KEEPER WILL APPRECIATE THIS.

A MOST WONDERFUL OPPORTUNITY

ulation must have taken place that very afternoon.

On Aug. 4 we looked again, and found a good many eggs in two of the frames, and to-day the hive is full of brood and many young bees hatching.

The general opinion among bee-keepers is, that if a virgin queen does not meet a drone within 21 days, she is no good. I wonder what those bee-lights think of this case—a virgin queen caged for seven weeks, and still all right.

I never had a case like it, and never read of one in the American Bee Journal in my 17 years of bee-keeping.

BERNARD W. HAYCK.

Adams Co., Ill., Aug. 30.

Why We Blush.

EDITOR YORK:—I have been a subscriber to the American Bee Journal for nearly a year. I will express my appreciation for your efforts to produce such a sprightly paper, deserving of the support of every one interested in bees. The many articles by veterans in apiculture are especially interesting and instructive to amateurs like myself.

Altho I am almost past the prime of life, and too old to learn many new tricks, I wish you all possible success with the green wood, i. e., young generation, to simplify the orthography of the English language. Never mind ridicule—that is the fate of reformers in every branch of human thought and effort.

I want to shake the hand of Mr. Doolittle for the bold and manly stand he takes in his recent article on the price of honey. He is a man who looks below the surface. If the people of his district want to do themselves proud, they should send him where such men are badly needed—to Congress. F. G. SMITH.
Sonoma Co., Calif.

"The Nectar in Flower-Cups."

Regarding that cogitation on page 487, in regard to my position on the different qualities of nectar in the same flower-cup, I wish permission to remark that I wrote so briefly that I did not have space to say that lime and silica are sparingly soluble in water, the latter the more sparingly; that, as the subterranean waters flow along thru the veins and fissures, they contain certain properties, as CO₂ for lime, for example, which make the minerals more soluble, so that they are carried in greater quantities to the surface in solution; that the water there parts with these conditions, and loses its solvent power, when most of the particles of mineral change to being merely in suspension, and are deposited according to rapidity of flow of the water and rapidity of rate of loss of solvent conditions. But still I have not room to enlarge upon it.

And now I will confess to our good friend Cogitator, that I do not know that "two contiguous nectar-glands secrete nectar of exactly the same thinness." But I confidently believe that there is no material difference; and I don't believe that Cogitator knows that there is any difference. Moreover, if a ribbon-like film of nectar should dry down at one end, as he suggests, it would be the upper end of it that would dry first, being nearer the air; and if yesterday's secretion should thicken before today's secretions are being poured out, it would show that bees were not overstocked, or the nectar would not have remained un-gathered; and, besides, from the established tendency of such things toward solution, what would hinder the thin nectar just poured out from dissolving and absorbing the other? or, what would hinder the morning dews from doing so? And why would this nectar dried down in the flower be any better as to quality than the same dried down in the hive?

I fancy this is rather a fanciful theory; and that is why I called attention to what seemed to me the weak points in the argument in its favor. It might be well for the next article in defense of it to specify how many and what species of flowers positively

have nectaries that allow honey-bees to sip the upper part of the nectar but not the lower portion; and just which of these species do not give their distinctive flavor or aroma to the honey by means of a volatile oil that is more apt to rise to the top than to settle to the bottom. It might be well also to include the mention that boiling honey destroys its flavor, and to say why this is if not because the flavor is lighter and more volatile than the sweetening, and further to enter into the exact dimensions and depths of the drops of nectar in the various flowers. I write with only the kindest of feelings, tho I think that this theory is undoubtedly erroneous in every respect. A. NORTON.
Monterey Co., Calif.

Season Too Wet and Cold.

The season has been too wet and too cold at night for bees. Flowers have been plenty all summer. Alsike is in bloom and will be until frost; plenty of buckwheat, fire-weed, golden-rod, etc. Bees work hard when the weather is pleasant, but the nectar is too thin. This has been the best day for honey-gathering for some days.

I started last fall with 22 colonies of hybrids, rather dark; I lost one colony in the winter, and one in the spring. I use 10-frame chaff hives. The snow drifted over them, but I left them there all winter. I fed syrup to the bees in the spring and rye ground for pollen. I have increased to 40 colonies. I shall want to Italianize all of my bees as soon as I can. ORLO GLEASON.
Newaygo Co., Mich., Aug. 16.

A Regular Growl.

The fads for the modern bee-keeper are getting too numerous; and if one took up all the so-called improvements he might sell large quantities of honey and still have an empty purse. So many conveniences are about equal to putting two handles on a dipper—it is more work to operate them than they are worth; and changing shapes and sizes of sections so often is perfectly exasperating; then the separator must be toggled over and over, wide and narrow, short and long.

There is no better general-purpose hive than the old-fashioned Langstroth, with its opening side instead of a division-board, the extracting-super holding the same size frames as the brood-chamber, and 2-pound section supers.

The chaff hive may be very fine for wintering bees out of doors, but it is altogether too ponderous for a woman to handle. And that gable-roof cover has a way of hitching at the corners that is a vexation to the soul of at least one woman who is usually in a hurry and don't want to be bothered. Board blankets, too, are a nuisance unless a cloth lining is used with them; for my bees have a way of sticking them down so tight that a knife or some prying tool must be used to lift the cover, which usually comes up with a jerk, and then there is high tragedy for the next scene.

Much as the plain sections and filled-out combs are lauded, the sections that are large enough to allow for the propolis would please the average housewife best. It is just as well if "the gravy" does not make a vast spread till it is needed. "The gravy" what a name for a conserve; but that's man fashion. MAY MAPLE.
Manistee Co., Mich.

Utah.—The Utah Bee-Keepers' Association will hold their semi-annual convention in the City and County Building, Salt Lake City, Oct. 5, at 10 o'clock a.m. A full program in the interest of the industry will be presented. All are invited. Some prominent bee-keepers are expected to be present, and one or more meetings may be held at the State Fair. J. B. FARR, Secretary.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held at the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1899. All are cordially invited. B. KENNEDY, Sec.
New Milford, Ill.

Bone-Cutters for Poultry-Keepers.—It is not a question among successful poultrymen whether green cut bone is profitable to feed—that has been established long, long ago, and admits of no doubt. But it is of great importance that the Bone-Cutter selected should be the best, with all the up-to-date improvements. The F. W. Mann Co., of Milford, Mass., were the originators of the bone-cutter, have had the largest experience, and have wonderfully improved their opportunities. They have always led, and by surrounding themselves with the best brains, skilled workmen and the very best material, the bone-cutters they offer this season are better than ever. It was once said not long ago by the editor of one of the leading poultry journals that "Mann's Bone-Cutter was as far ahead of all others, as an express train is ahead of a two-horse team." It has been the purpose of this Company by fair dealing and first-class goods, to foster such sentiments and to maintain the prestige so long accorded to them.

To avoid the great waste in feeding, they invented and placed on the market their patent swinging feed-tray. The large sales that followed attest its popularity among the fraternity.

Their clover-cutter has also met a long-felt want, and has jumped into great favor. It is not surprising that it should, as it cuts very rapidly, very easily, and leaves the clover in the very best condition for feed. It is an impossibility for a fowl to get crop-bound when this clover-cutter is used.

Their granite crystal grit possesses qualities found in no other grit. It is harder, sharper, cleaner and more economical than any other, and has already become the standard and leading grit of the country. They have shipped it as far distant as South Africa, and all over the United States.

We can heartily recommend this firm to our readers, assuring them that they will receive the full value for their money, and that all goods will be just as represented. They report a successful business last year, with prospects for a still greater trade this year. Their success is a just reward for the inventive skill that has given to the fraternity such valuable aid in the form of special machinery that has done so much to make the poultry business a successful profession. Send for their catalog, and say you saw their advertisement in the American Bee Journal.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 359 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field. Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 7.—Fancy white comb honey, 15c; No. 1, 13@14c; light amber, 11@12c; dark and amber, 9@10c. Extracted, white, 7@8c; amber, 6 1/2@7c; dark, 6@6 1/2c. Beeswax, 25@26c.

Consignments of small lots of comb honey are becoming more frequent, and while there are some who will not buy at the prevailing price, yet a fair trade is being done; this also applies to extracted honey and beeswax.

R. A. BURNETT & Co.

KANSAS CITY, Aug. 10.—The receipts of honey are light, demand fair. We quote: Fancy white comb, 15c; No. 1, 14c; No. 1 amber, 12@13c. Extracted, white, 6@6 1/2c; amber, 5 1/2@6c; dark, 5@5 1/2c. Beeswax, 22@23c.

C. C. CLEMONS & Co.

NEW YORK, Aug. 22.—Demand good for new crop comb honey, excepting buckwheat. We quote as follows:

Fancy white, 14@15c; No. 1 white, 12@13c; fancy amber, 11c; No. 1 amber, 10c. Extracted firm at unchanged prices. Beeswax dull at 25@26c. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 25.—White comb, 11 1/2@12c; amber, 8@10c. Extracted, white, 7 1/2@7 3/4; light amber, 6 1/2@7c. Beeswax, 26@27c.

Market is firm at unchanged quotations, with demand fair and offerings light. The last Panama steamer took 312 cases extracted for New York. The ship Cotesima sailed with 349 cases for Liverpool; another took 4,000 lbs. beeswax.

CLEVELAND, Aug. 18.—New honey scarce and to good demand. Fancy white, 15c; No. 1 white, 13@14c; fancy amber, 12c; No. 1 amber, 10@11c. A. B. WILLIAMS & Co.

BOSTON, Sept. 8.—Fancy white comb, 1-pound sections, 16c; A No. 1, 14@15c; No. 1, 12@13 1/2c; No. 2, 11c. Light amber extracted, 8@8 1/2c; amber, none to quote. Beeswax, 27c.

Practically no new comb honey has been received as yet, and stocks are steadily being reduced, so that there is really no honey on hand, with quite a little inquiry. We strongly advise shipments of comb honey to be made as early as possible. BLAKE, SCOTT & LEE.

BUFFALO, Sept. 8.—Receipts continue very light of strictly fancy 1-pound comb, which sells very well at 12@13c, occasionally 14c; dark from 8@9c; low grades less. Few small lots can be placed fairly well right along now.

BATTERSON & Co.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14@15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7@7 1/2c.

PEYCKE BROS.

DETROIT, Aug. 19.—There has been no offerings of new honey and old is fairly well cleaned up. Fancy white we think would bring 14 cents, other grades proportionately cheaper. White extracted, 7@8c; no dark to quote. Beeswax in good supply at 23@24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

No. 38.

CONTRIBUTED ARTICLES

Mr. F. L. Murray and His Apiary.

I began bee-keeping in the spring of 1892, with four colonies in 8-frame Langstroth portico hives. I was working for the Chicago, Milwaukee & St. Paul Railway Company as a telegraph operator and station agent the fall of 1891. A Mr. Reed (from whom I bought the bees) got me interested in the subject, and I agreed to buy four colonies from him in the spring, and work up. So in the spring of 1892 I quit the railroad and went home to learn the art and mysteries of bee-keeping.

I increased the four colonies to 12, and had 200 pounds of nice honey in pound sections for my experience that season. I have been working with the bees more or less ever since.

In the spring of 1892 I also began raising fancy poultry, and find it works very nicely with bee-keeping, for I do not agree with Mr. W. Z. Hutchinson, who says, "Carry all the eggs in one basket, and carry them so carefully they will not break." I would prefer to have mine in more than one, so if one basket gets tipped over I will still have some left, for the best of us is likely to get tripped up some time.

I have now 160 colonies in two yards. My sister (Mrs. White) and son Lynn, aged 13, are also greatly interested in bee-keeping, and give me what help is needed, for, like "Rambler," I am living in single blessedness.

The illustration herewith shows part of my home yard, which is run for comb honey; the out-yard is run for extracted honey. I use the 8-frame dovetailed hive in both yards. In the out-yard I use three hive-bodies, with a queen-excluder between the second and third bodies, and do all my extracting from the third story. With this method I do not have any swarming to speak of, and do not visit the out-yard except to extract, or do any other necessary work with bees.

The home yard is wintered in a cellar, built expressly for the bees in the yard, which winters them as nearly perfection as they can be wintered in a cellar. The out-yard is wintered in clamps 16 feet long, each holding 10 colonies packed in chaff, which is my favorite way of wintering and springing bees. The cov-

ering is not taken off until settled warm weather has come, and they get the spring protection needed this far north that the ones in the cellar do not get, and those colonies wintered out-of-doors packed in chaff are always in better condition than those wintered in the cellar with no spring protection after putting them out.

Of course, there are two serious drawbacks to wintering out-of-doors, and they are the labor involved in packing them, and the extra brood consumed to keep up sufficient heat.

I lost quite a number of colonies in the out-yard last spring by unavoidable neglect. About the time in spring when we had our first warm days, and the entrances should have been cleaned out, and colonies looked after, my father died, and it was impossible to get away to attend to them, so what I lost smothered by not having proper ventilation. I have always had my share of the honey crop in this section of the State (when there was any honey to get). The crop throughout the State, as nearly as I can learn, is a light one this season.

As a rule, when a person gets the bee-fever how enthusiastic he gets over it, if he has a love for Nature, for in becoming a practical bee-keeper, and studying the busy insects he is interested in, and the flora of the country, it puts a person more in touch with Nature and the mysteries that surround us in our daily work than any other pursuit I know of; for bee-keeping is noble, and is a higher inspiration than any other branch of agriculture.

With our present methods of handling bees, and our facilities for shipping the honey crop (when we get one), it is a round of pleasure from taking the bees out in the spring to putting them away in the fall. I always feel grateful to the veteran bee-keepers for the services rendered the present generation, for there is no other industry

Mr. F. L. Murray's Home Apiary Showing Wintering-Cage, Bee-Tent, Swarm-Catcher, etc.

that is represented by as intelligent a class of men and women who are so liberal with their practical ideas and experiments, for, as a rule, there is no improved implement or method of conducting an apiary but is given to the bee-keeping world as freely as water—it is not hidden under a "half bushel" to make money out of, as most other pursuits are conducted. Long live the big-hearted, whole-souled bee-keepers: they are a class of people we should all be proud to belong to.

Crooked Section-Combs—Difference in Colonies.

BY G. M. DOOLITTLE.

QUES.—I am trying to produce section honey without using separators, and have some bulged or crooked combs. Some time ago I read the following in a paper: "In the fall, after extracting the honey from the partly-filled sections, and recasing the sections of empty comb, no separators being used, the combs are not always perfect in the sections. When we find one side a little fuller than the other, we put the two full sides together, and the hollow sides together. No matter if the full sides of the combs should touch each other, when the bees begin operations the following season they will cut right thru, building out the other sides equally, and the occasional crooked ones are thus made straight." Is this right? I have it copied into my diary.

ANS.—The very admission of both yourself and the writer quoted, should convince you that the only way to produce section honey, in the most marketable shape, is to use separators. When a person admits that occasionally he has crooked combs by the non-use of separators, I always read between the lines that those occasional crooked combs can be multiplied by ten and not be far out of the way. And then those occasional crooked combs condemn the use of any system which gives an occasional faulty thing, when there is a system equally good in every way that does not give a single faulty section along the line of crooked combs. But, to the question:

I wonder if the writer had ever practiced the plan given, and, if so, how it could be that his experience was so much different than mine had been when trying the same plan. In every case where I ever put two combs in sections, or brood-combs even, so that they touched each other, I have found that the bees always left little bridges of comb from one comb to another, so that, when the combs were pulled apart, the cappings of one or both combs were broken, thus setting the honey to running and making the sections in anything but the best marketable shape, unless put back on the hives for the bees to recap the cells. And this is not satisfactory, for in so doing the bees nearly always remove the honey out of these damaged cells, so that the whole process requires nearly half as long as it does to fill a section from the start. This causes a great waste of time to the colony, for they are thus kept fussing over a bad job instead of doing new work.

My plan has been to place any crooked combs I may chance to have—brood-combs or otherwise—at the top of a warm room, on a piece of canvas, until thoroughly warmed thru, when the combs can be bent and straightened to the perfect satisfaction of the operator. In this way I have a perfect thing of it; and as the work is performed in the winter it is much more cheaply done than in having the bees make a "botch job" of it in the summer.

DIFFERENCE IN COLONIES AS TO SURPLUS.

QUES.—I have noticed for some years back, that, of many colonies in the spring, which were exactly alike, as nearly as I could discover, some colonies would give an excellent surplus, while others would give very little or none at all. Why is this? Can you tell us in the American Bee Journal?

ANS.—Here is a question that used to bother me greatly, for I was formerly troubled in the same way: but of late years I have succeeded in making the most of my colonies which were worked for honey, produce nearly like results; that is, if one colony contains 40,000 bees and produces 100 pounds of honey, I obtain about that amount from every colony containing a like number of bees; while one having 20,000 bees gives a yield of about 45 pounds, for a small colony will not give quite as large a yield in proportion to its numbers as a large one. After carefully studying on the matter I found that colonies I pronounced "exactly alike" on May 15 would not be so at the time the honey harvest

was at its best. The trouble was I did not have a thorough knowledge regarding the working force of my bees at all times, nor of the interior of the hive.

For instance, the colony which I called the best on May 15 might become the poorest by July 10, at which time the honey harvest arrived. This might be owing to two causes, one of which would be the failing of their queen, and the other that the colony would reach its maximum of strength some time previous to the harvest either of which is sure to lessen the yield.

I have often noticed that a colony which winters extremely well, and goes to breeding rapidly in early spring, is generally sure to produce less honey than the colony that begins to breed rapidly from 40 to 50 days previous to the honey harvest. The reason seems to be, that the queen in such a colony breeds rapidly very early, ceases her prolificness to a very great extent by June 5 to 10, thus allowing the bees to put the first honey coming in into the brood-combs, rather than forcing it into the sections, as does the queen which arrives at her maximum egg-laying at this time. If this is not the case, the colony becomes demoralized by becoming too strong at this time, and so goes to loafing around, or, what is worse still, contracts the swarming-mania—either of which is against a large yield of section honey. If the bees become over-anxious to swarm, or the queen ceases to be prolific, so that the bees get the start of her and store honey to any great extent in the brood-chamber during the first of the honey harvest, that colony will not do nearly as well as will one which does nothing of the kind.

The remedy is to keep the queen on only a few combs early in the season, or take away a part of her brood to strengthen weaker colonies till the right time has come, when her extra powers will rear bees that will come at just the right time; then coax her to do her level best, and you will succeed. At this time give all the combs the hive will contain, and let her spread herself to her greatest capacity, then the colony will reach its strongest point just when the harvest is on, and thus bend every energy at storing in the sections rather than crowding the queen, or loafing around.

A Skillful Canadian Bee-Keeper's System Reviewed.

BEE-KEEPING, as an industry, or even as an adjunct to farming or other occupation, is not as general in a country so favorable to it as ours as its advantages would seem to warrant. True, it is an occupation for persons of leisure, but on a farm where the family comprises several members, a few colonies would be found to give very little trouble, and furnish an article of food which would be not only a relish but a healthful daily adjunct of diet.

Going further, we may state from experience that after the habits of the bees are commenced to be understood, and therefore the methods of manipulating them mastered, they become a source of real interest and pleasure, and if gone into on an extended and thoro scale, a means of considerable revenue. If one has the qualifications of being cautious, observing, and prompt, bee-keeping can be engaged in without fear of failure, and to persons who swell up and become seriously affected with the stings, it may be some comfort to know that after a few stings the system becomes inoculated against the effects of the poison, when a prod from an angry bee becomes of little more account than a mere mosquito-bite.

The management of an apiary is not a difficult matter, and needs very little outlay to commence with. One handy with tools can make the hives and nearly all their attachments. True, no matter how full instructions are received, or how many bee-books are read, many points will have to be picked up by experience and observation, so that to succeed in getting the most from the colonies, observation, perception and invention play an important part. These and many other necessary qualifications have assisted the very successful apiarist and proprietor of "Evergreen Farm" and bee-yard, Mr. S. T. Pettit, of Elgin County, who now, at the end of 25 years of studious experience, is looked upon by the more advanced bee-keepers of Canada and the United States as one of the first authorities of apiculture.

On July 20 we spent most of the day with Mr. Pettit, who, with his son, was busy taking off the last of this season's extracting. This will be finished in a few days, when

the fine harvest of fat-comb sections will be removed. By observation and conversation we gathered many important features of Mr. Pettit's system, which we will endeavor to give to our readers.

COMB HONEY THE SPECIALTY.

Mr. Pettit, like many advanced bee-keepers, makes a specialty of comb-honey production. The proportion taken is largely governed by the extent of the swarming, as new swarms are better suited to comb-honey production than those that have come out from winter quarters. This year (1898) swarming has been under the average, and, as a result, Mr. Pettit has only about one-third of his hives supplied with comb-section supers. The spring is usually commenced with 75 to 80 colonies, which come out in vigorous condition from the cellar.

The hives used are of Mr. Pettit's own invention, having brood-frames 9 inches deep and 14 $\frac{1}{2}$ inches long, and extracting-combs 14 inches deep, and of the same length as the brood-frames. The hives are built to hold 12 frames. When the bees are first brought out in spring they are confined to the brood-chamber until maple blossom commences. Shallow supers are then put on, and the brood is spread in the brood-chamber by placing the center frames, which contain most brood, on the outside and exchanging for them the outside frames, which contain more or less honey. This is uncapt, so that the bees can readily remove it to the super, leaving room for the queen to lay in these combs when emptied. This exchanged position of frames is only safe when the bees are sufficiently numerous and strong to keep the outside frames of brood warm. When clover honey-flow commences, the strongest colonies are given comb-supers in place of the shallow supers first put on, but the others are given extracting-supers 14 inches deep. Usually two comb-honey supers, each holding 36 sections, are put on, but when the strength of the colonies and copiousness of honey-flow will warrant it, three supers, or 108 sections, are put on. Sometimes the third super is added after the others have become filled, or nearly so. At the time of our visit nearly half of the comb-honey-producing colonies had three supers, which in most cases contained about 14 ounces of beautiful, well-capt honey per section.

EXTRACTING HONEY.

Mr. Pettit has his own method of taking off extracted honey. As soon as the frames become filled the first time in the season, the six fullest frames are selected out of each hive, and the remaining six are shoved to one side, and empty frames placed in the empty half of the super. The date and side removed are written on the back of the hive, and as soon as full and capt the other side is extracted. By this means the bees are not delayed for a moment, and the work of extracting is facilitated. This is the means adopted till the last extraction (which was in operation at the time of our visit), when all the combs are exchanged for empties. It is remarkable the amount of honey these bees are made to produce, viz.: from 150 to 160 pounds per colony of extracted honey.

Mr. Pettit has an ingenious and simple method of removing the full combs. When it is desired to remove six frames, as is the custom early in the season, the hive-cloth is stripped off just the width of the six frames, a few puffs of smoke sends the bees down, when the frames are quickly lifted out and the empty ones placed in before the bees have commenced to return. The cloth and cushion are replaced with very little disturbance to the bees. As the full combs are lifted out they are each given a shake before the hive, and then stood up at the back of the hive till the cover is put on and they are ready to be taken to the extracting-room. The few remaining bees, which by this time feel lost and lonesome, are swept off with a feather, and all is over in a very little more than a minute, with no commotion, no stinging, and no chance for robbing. The extracting is done by a large extractor, which handles four frames at once.

The empty frames last put on continue to receive a little honey thruout the remainder of the season till brood-rearing has ceased, about the middle of September, when the supers are all removed. This is done thruout the whole yard as nearly as possible at the same time. Each super is left uncovered and placed on the ground a few feet in front of the hive from which it was taken, and which is now covered with cloth-cushion and hive-cover. This sets the entire working population in active service, carrying the honey into the brood-chambers for winter stores.

True, a big commotion is set up, but practically each swarm is attending to its own case, and no evil results from robbing or any other cause. About the end of September

the hives are examined to see what stores are needed, and feeding is proceeded with as it is deemed necessary. The food given consists of four-fifths granulated sugar and one-fifth honey. It is calculated to allow each colony 30 pounds of stores for the winter months.

SOME NICE POINTS IN MR. PETTIT'S SYSTEM.

Bee-keepers know generally how difficult it is to have the outside, either comb or extracting, frames as well filled as those in the center of the super. Mr. Pettit has quite overcome this difficulty by allowing the entrance to extend clear across the hive, and by raising the front an inch and a quarter above the bottom or floor, by a wedge on either side of the entrance. This allows the bees to enter the hive the full width, and compels them to walk up the sides or back of the hive, so that they always fill the outside frames first instead of last, as is the case with the narrow entrance.

Another means to this end with comb sections is to create a bee-space between the outside comb sections and the walls by inserting a perforated divider held out from the wall by tiny blocks of wood a bee-space wide. This allows the bees to pass up and down freely, which they do the same as between the sections, and holds more bees at the outside of the sections.

Another advantage afforded by the wide and deep entrance is the ventilation and comfort afforded the bees, especially in hot weather. Undue swarming is thus prevented. The extracted-honey hives are ventilated at the top and at the back, but no top ventilation is given the comb-honey hives, except for a few days after a new swarm is hived, when it is necessary to afford them comfort in order to commence their working at an early date. This is usually permanently closed up on a cool evening when all have settled down.

Another practice with a newly-hived swarm is to substitute two frames on either side of the brood-chamber for dummies, so as to contract the brood-chamber and get the bees working in the sections above. Late in the season six dummies, or three on either side, are inserted, but it requires the judgment of an experienced bee-master to manipulate these nice points.

Regarding the capture of swarms, Mr. Pettit always keeps his queens clipped, so that they are not able to take flight with the swarm, but commonly fall on the ground in front of the hive. She is picked up and placed in a cage, which is placed in the entrance of a new hive, which takes the place of the old one, which is moved about two feet back and left there about six days. As soon as the issuing swarm find their queen is not with them, they return to the old stand, but new hive, find their queen, and at once proceed to occupy the hive.

Some of these ingenious methods may be used in general practice, but not a few of the most valued of them originated with Mr. Pettit, who delights in giving to the bee-keeping world the benefits of his experience and invention.—Farmer's Advocate.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. E. MASON, SEC.

The 30th annual meeting of the United States Bee-keepers' Association was called to order at 7:30 o'clock, Tuesday evening, Sept. 5, by the President, E. Whitcomb, of Nebraska.

Mr. Haenle, of Philadelphia, sang a solo, and prayer was offered by Rev. E. T. Abbott, of Missouri, after which Mr. John L. Kugler read the following paper:

The Fall Honey Crop of Philadelphia.

The subject assigned to me by your secretary, is the fall honey crop of Philadelphia. I sought to have this changed to the fall honey crop of southern Philadelphia, as the flow which they wish me to tell you about is confined to points

below the thickly built portion of the city, and along the banks of the Delaware River. It extends on both sides of the same in the States of Pennsylvania, New Jersey and Delaware, until the Bay is reached, and, possibly, further south. The northern part of Philadelphia has none of this flow. They denied me this change of title, but as I know more about the honey crop of southern Philadelphia, I will confine most of my remarks to that portion.

Our fall honey is very fine in flavor, bright amber in hue, quite dense, and finds ready sale. It is nearly all extracted, only a little comb honey—very little indeed—being produced, and the bee-keeper soon abandons the use of sections. This honey comes from the meadows and reclaimed ground along the Delaware River.

As to what flowers the larger part of our crop comes from, we do not agree. We think it is mostly from the heart's-ease (commonly called smart-weed), fall asters, golden-rod, wild cosmos or life-root, queen of meadows, iron-weed, etc.

We find that our largest crops come when we have a dry fall preceded by a considerable amount of rain in the spring and summer months.

We then have clear days for the bees, and the rising tides keep the plants in perfect bloom. The rain in the spring and summer helps the growth of the plants on the high ground, and when these conditions are combined, our crops are measured by the quantities of comb we have on hand, to give them for the storing of the honey.

When I first joined the Philadelphia Bee-Keepers' Association, and told them about our fall flow, I was treated very kindly by them, yet distinctly given to understand that they thought I had been drawing very largely upon my imagination. This was the universal opinion of its members, so that it took me two years to get them to hold one of their bee-meetings at my apiary, and then only a few members attended. It was only last June that we succeeded in getting our president, Dr. Townsend, at a meeting in our neighborhood, but I will say that after coming, and seeing for themselves, they have made ample amends for their want of faith in my statements about our fall flow, and hence this paper.

We are compelled, like other bee-keepers, to prepare in advance for our crops, as Mr. Hutchinson says, "The successful bee-keeper gets his colonies in shape the preceding year," only we are not troubled with swarming and its attendant evils.

Our spring flow is very small, sometimes not enough to keep the colonies during hot weather, and when we have a spring crop it is so dark as to be almost valueless, being composed largely of honey from the poplar.

I have kept bees for 14 years, and in that time I have known only one season when we were troubled with swarming. As a rule—and a fairly safe one with us—a colony in a two-story Simplicity hive will not swarm. I do not wish you to get a false impression from this statement, and think that it is due to small colonies, as we find that such do not pay; but it is rather due to a lack of surplus in May and June.

Our fall crop commences about the middle of August, and extends up to heavy frost, altho the surplus is all in by the last of September. Yet I have known the bees to bring in honey as late as November, but in small quantities, probably from plants protected from frost by the river.

During the fall flow we are unable to get the bees to build comb in supers or frames above the brood-chamber, on account of the cool nights; this is the reason we all run for extracted honey. We generally try to keep the bees building comb in May and June, storing the frames that are not in use in the second, third and even fourth stories. This keeps them free from moth, and allows them air-space during the intense heat of summer. When I find a crop of poplar honey comes in our apiary, I endeavor to get the bees to convert this into new combs. In my neighborhood, in a circuit of two miles, we can count about 350 colonies, but I do not think that half of them produce fall surplus, simply from the want of proper management.

Along the banks of our river are vast meadows, mostly reclaimed on the Pennsylvania side with dykes, etc., and it is here our bees find pasture, and I think there is many a river in the States where like pasturage may be found that is now visited by very few bees.

I have secured a few samples of flowers from our meadows, some of which we do not know the names, and I think a few are of foreign origin. Every year a large number of vessels arrive in the port of Philadelphia from all parts of the world. Quite a number of the flower-seeds come in ballast, some of which is dumped in the river on the way up,

and we think the seeds are brought to our shores in this manner.

I increase my colonies mainly, or, I might say entirely, by dividing them—that is, by taking three or four frames of brood and giving them either a queen-cell or a young queen, so they can bring in honey to winter on. I find it advantageous to keep two points in view—strong colonies and plenty of combs, providing they are free from moth; and when these things have been accomplished, I am almost sure of a crop.

One of my neighbors, a Mr. Ludwig, has an apiary of over 100 colonies, and last year he produced 350 gallons of extracted honey.

I am informed that our brother bee-keepers in points north of Philadelphia are feeding their colonies, when we are having one of our large yields, and this before the asters on high grounds are in bloom. J. L. KUGLER.

On motion of W. A. Selser (Pa.) it was voted that no person be allowed to speak more than five minutes on any subject under discussion.

W. A. Selser—We are all favored in one thing, that is, the tide that feeds the rootlets and never fails because the tide never fails, so that those who live south of Philadelphia never fail to get a good flow of honey.

A. L. Boyden (Ohio)—Very often we get samples of flowers. I presume our friends can do the same.

Some samples of honey-producing flowers were exhibited by Prof. Keebler, among which were—

Eupatorium purpureum (reddish in color)—Joe-Pye or trumpet-weed, gravel-root, fall or purple boneset, kidney-root, queen of the meadow.

Eupatorium perfoliatum—boneset, common thoroughwort, Indian sage.

Collinsonia Canadensis—horse-balm, rich-weed, stone-root.

Bidens trichosperma—gall tickseed, sunflower.

Vernonia noveboracensis—New York iron-weed, flat-tops.

Sonchus oleraceus—annual sow-thistle, hare's-lettuce, hare-thistle, milkweed, milky gassel, swiney.

Prof. Keebler said of course they all belong practically to the composite family.

Rev. E. T. Abbott—I am an amateur botanist. We have a wild flower in the West, but I have never been able to name it.

Prof. Keebler—Some express doubts about the name of this flower, but if I come here to-morrow I will look up the name for you.

After a song came the following paper by Mr. Fred L. Craycraft, of Cuba, entitled,

Possibilities and Difficulties of Bee-Keeping in Cuba and Porto Rico, and the Effect of Our New Relations With these Islands on Our Honey Markets.

The recent struggle of the Cubans to throw off the Spanish yoke, and which finally culminated thru the intervention of the United States, is still fresh in the memories of all, and on account of the close commercial relations which exist between these countries, and the possible annexation of this island, thus adding another star to our national ensign, has caused people to observe with interest signs of renewing commercial, agricultural and industrial activity, which will in time cause a profound impression on the American people, benefiting many by opening up new markets for American products, while at the same time others will seriously feel the competition caused by the introduction of products from these countries into our own markets.

This question is one of particular interest to the American honey-producer, since heretofore the production of honey in this country has been largely in excess of home consumption, and we know that exportations of honey and wax from the island have been very large, altho the almost absolute lack of reliable statistics upon which to base any calculations as to the future exportations of this article make it a very difficult matter to form any approximate estimate of the importance it will bear on our honey markets in the future.

The honey and wax production of Cuba before the war, which commenced in 1895, was very important in all districts of the island, especially in the provinces of Puerto Principe and Santiago de Cuba. According to the statistics of exportation of Cuba, published by the minister of insular affairs of Spain; during 1894 2,433,969 milograms

(5,354,000 pounds) were exported from Cuba. Of this amount 4,300,000 pounds were shipt to the United States, but almost all was shipt in transit to European markets, only a very small percentage entering the American markets.

According to the same authority only 1,404,845 kilograms (3,090,000 pounds) were exported in 1895. This large falling off in exports is easily explained by the fact that in February of 1895 the revolution commenced in the eastern provinces, and the writer's own practical experience with an apiary of 300 colonies demonstrated that the honey-yield was considerably under the average—caused by the cool northeast winds which prevailed during the height of the campanilla bloom.

With a very few exceptions this must be considered a natural and spontaneous production, as the bees receive very little care, the only physical exercise required being to put the swarms into empty boxes, and place a palmetto leaf on top weighted down with a stone. The mental exertion required in studying up better methods for their management was considered entirely superfluous.

The native creole or box-hive consists of a box about 4 feet long and from 8 to 12 inches square inside, and open at one end. Where lumber is scarce, hollow logs are sawed off and used in the same way. The hives are placed in an almost horizontal position, only being inclined enough to keep the water from running in at the entrance or open end.

The old adage, "There's nothing new under the sun," is strikingly proven in this case, for here it is that reversing is carried to perfection. When a swarm is placed in one of these long boxes, the bees take up their abode in the spot most suited to their fancy, generally near the middle, leaving a vacant space at each end. As the honey-flow commences the bees naturally build comb and store the honey in the closed end where it is better protected from outsiders. The first extracting takes place during the latter part of December, when the board is knocked off the rear end, and the honey cut and pulled out with long hooks. After this operation, the hives can be turned around and the other end closed up, the extraction of the other end taking place during the latter part of January. Two, and sometimes three, extractions are made during the season, besides a "limpieza," or cleaning up, given the bees in August or September, when some honey and considerable wax is taken from them, thus reducing the opportunity for the moth-worm to get a hold on them.

It can be seen that altho the honey-flow is very bountiful, only a limited amount of honey is obtained on account of the bees not having any place to store it.

Taking into consideration the waste consequent upon such a crude system in manipulation, I think an average of three gallons of honey per hive to be a conservative estimate, and if we can place any reliance on the statistics of honey exported during the economical year of 1894, it will be seen that it took nearly 160,000 colonies to produce this amount.

It is difficult to form anything but conjectures regarding the importance and value of apiculture in Cuba, as the wave of fire and death which swept across this beautiful island has almost totally exterminated not only the bees, but also their owners. The following instances are given as examples: From the mayor of the town of Jaruco, 25 miles east of Havana: "I calculate that 98 percent of the bees in this district have been destroyed since the beginning of the war. There are now only four apiaries consisting of 250 colonies. Colonies in creole or box-hives yield about four gallons each, and those in American hives, 16 gallons each." It will be remembered that this is the place where the Casanova apiary was located, and which was so ably managed by our late friend, Mr. Osburn, and from which Mr. Somerford got the banner honey crop of Cuba. Thanks to the purifying effects of fire, the foul brood which wrought such havoc in that apiary has been eradicated.

From the town of Candelaria, in the province of Pinar del Rio: "Before the war there were five apiaries of over 700 colonies each in this district, besides many others of less number. There are now only a few scattering colonies which were saved within the town."

From Amarillas, a town on the south coast of Matanzas Province: "Before the war there were 10,000 colonies in this district; now only 90."

From the foregoing it can be seen that at least 90 percent of all the bees on the island have disappeared.

Since the first of January, 1899, to July 1, over 600,000 pounds of honey have been exported from Havana; of this

amount over 500,000 pounds have been shipt direct to France by the firm of Bridat, Mont Ros & Co., who, on account of their dealings and liberal prices, have succeeded in handling almost the entire crop of honey, thus breaking up a clique of dealers who formerly put their own prices on the article and crowded out legitimate competition. During the two preceding years the same firm exported over 1,500,000 pounds of honey, and large quantities of wax.

There are now in the province of Havana nine modern apiaries containing about 1,700 colonies, and others are being started in different parts of the island. The country around Nuevitas, in the province of Puerto Principe, has the name of being the finest part of the island for bees, as large quantities of honey and wax are brought from there in coasting-vessels. From what the writer has seen of the island, there is very little territory where bees do not do well, unless it is where there are a great many sugar-mills, and the surrounding country is all taken up with sugarcane, and unless the place is overstocked with bees the writer thinks there are few places where 10 gallons per colony cannot be obtained.

The price in Havana markets ranges from 40 to 50 cents per gallon, net, the buyer paying the cost of package. The crop is all handled in hogsheads of from 100 to 105 gallons each. In any good location 300 colonies can be kept without overstocking, and with the exception of during the extracting season, from Dec. 1 to March, one man can care for two such apiaries, provided they are of easy access.

There are also difficulties to be taken into consideration, but, as all bee-keepers know, many of them can be overcome by the judicious use of that one quality vigilance. One of the main things necessary is to keep the colonies all supplied with young and vigorous queens, thereby freeing them from the ravages of the moth, so much feared in tropical countries.

As there is no time during the 365 days of the year (except when it rains) when the bees cannot get out and find something to carry in, they can be increased very rapidly. During the rainy season, especially the latter part of September and October, when we are sometimes visited by storms and rain which last several days, it is necessary to watch the bees closely, and sometimes feed the weaker colonies, for the high winds bruise and toss about the nectar-yielding plants so much that there is a scarcity of flowers, and those which are short of provisions are liable to succumb before Nature gets back to her usual conditions.

When the rainy season closes in November, the flowers begin to give a variety of color to the luxuriant vegetation, and from then until March there is nothing to do but to take out honey, as the bees store it so fast that the queens are kept restricted to the lower story. In March and April some honey is also extracted, but the queens begin extending their domains, and swarming commences, altho the swarming-fever does not get so bad here as it does in the northern climes.

Last, but not least (altho they are very small), is the ant problem, which is one of the most important to the Cuban bee-keeper, especially during the rainy season, for they take refuge by thousands under and in the hives, and often cause weak colonies to abscond.

Another important matter to take into consideration here is the cost of living, which is at least 50 percent more than in the United States. With the exception of sugar and tobacco (the staple articles of export) almost everything is imported; not that the country cannot produce everything needed, but on account of the total destruction of rural wealth and the depopulation of the country, there is nothing planted, and what were once productive farms are now abandoned to weeds and grass. This, of course, is only a temporary condition which will disappear when the tide of immigration turns this way.

On Aug. 10, 1899, bee-hives were placed on the free list of importations, and altho the duty on them was not excessive, this will doubtless give an impetus to the industry. But even if Cuba does take the lead as a honey-producer, as long as the duty of 20 cents per gallon remains on extracted honey it will not enter American markets, for while Europe can pay even 40 cents per gallon, net, in Havana, Cuban dealers cannot pay 20 cents per gallon duty, freight and cost of package, and compete with American honey at 60 and 65 cents per gallon.

So far there has been very little comb honey produced here except for the home market in Havana, which is very insignificant, as Cubans are not great honey-eaters.

Campanilla honey is as white and equal in flavor to any in the world; and when comb honey is put in nice

shape by specialists it will undoubtedly win for itself a name and place in the American markets equal to the finest of white clover or basswood honey.

FRED L. CRAVCRRAFT.

W. A. Selser The writer of this paper has made a statement that I cannot agree with. He says as long as there is a duty of 20 cents per gallon on Cuban honey there would not be enough honey brought in to hurt our market. This is incorrect. Cuban honey, when baked in a cake, will hold moisture longer than American honey. I believe in calling things by their right name. When the war with Spain first broke out I was afraid that Cuban honey would come in faster, and I here say that I consider our new possessions a curse, and I could substantiate what I say. Now, these are facts we have to face. How we are to solve these problems I do not know. Another thing the writer says is, that we might place Cuban honey in two classes. Cuban honey will never be used extensively in this country on the table, because it is so dirty. It is packed in, chucked in, dirt and all, but when it comes in a cake we don't see the dirt. Now, I believe we might find a new market among people who do not use honey.

Mr. Abbott—Permit me to offer one suggestion. The honey that Mr. Selser refers to as being unfit for table use is what is used by the natives. The flavor is fine. The question is, Is that likely to be shipped North? I hardly agree that it is harder to keep bees in winter than in summer.

O. O. Poppleton (Fla.)—That is the fairest and best article I have ever heard on this subject.

Dr. C. C. Miller (Ill.)—The statement that this honey is good only for bakers settled any doubts in my mind, but when Mr. Selser says one firm used 12 loads, is there not cause for uneasiness? That probably is not the only firm that uses large quantities of honey.

Mr. Selser—We have a baker here in the city that uses it, also bakers in New York.

I. J. Stringham (N. Y.)—I know one firm that ordered 200 tierces of honey (100 tons), and I do not consider that the locality is well developed. That is the first year that the New York market has taken anything in comparison, on account of the 20 cents duty.

[Continued next week.]

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Queen Laying Irregularly—Wild Touch-me-not.

1. I have a young queen just commencing to lay, and she lays one, two and three eggs in a cell. Why does she do that? Will she be a good queen to keep, or would I better destroy her and unite the bees with another colony?

2. I enclose a flower that grows quite plentifully on the low land around here, and the bees work on it from morning till night. Can you tell me its name? Does it furnish honey or pollen, or both? INDIANA.

ANSWERS.—1. Don't be in a hurry to kill the queen. It is not unusual for a queen to be a little irregular on first commencing to lay. Very likely she'll come out all right. A week or so ago I found in one of my hives a comb with no eggs or brood on one side, but the other side was well supplied with eggs, most cells having more than one egg, and some having four or five, no other comb having brood or eggs. After the eggs hatched out only one larva was found in each cell, and I think the queen will get over her foolishness.

2. Wild touch-me-not, I think, but I don't know its value for honey or pollen. If bees work busily on it, you may be sure it is valuable for one or both. If you see no pollen on

their legs, then you can count it a honey-plant. If you see pollen on their legs, then watch and see if the bees seem to be sucking nectar as well.

Queen Daughter Varied from Her Mother.

One of my neighbors, wishing to rear a few queens, placed a frame of young larvæ in a queenless colony, and as soon as the cell-cups were built, I transferred the frame to a colony of black bees, they being allowed to complete the cells, which in due time hatched and produced young queens, some of which were nearly black, others very brown, being decidedly different in color from the mother, which is supposed to be pure Italian and produces beautiful 3-banded workers. Why did the young queens look so "shady"? Were they contaminated by the black nurses? MASS.

ANSWER.—It is the rule and not the exception that the royal daughters of Italian queens vary in appearance from their mothers and from each other. It is not likely that the black nurse-bees were in any way responsible, altho some hold that traits are transmitted by the nurse-bees.

Queen Superseded.

As I had a queen that was not giving me the returns I desired, I sent for another, and when I went to remove the old queen, after smoking at the entrance, I raised the super and the first thing I saw was the queen on top of the frames, helpless, but she looked large and prolific. On raising the frames I found eggs and brood in all stages. She died in about six hours. In 24 hours several cells were started. The new queen was accepted at once. What could have been the matter with the old one? She was full of eggs.

MISSOURI.

ANSWER.—I don't know. Perhaps nothing more than old age. It is probably the usual thing that queens are superseded while they are still in apparent vigor and "full of eggs." Indeed, many a queen is superseded when the beekeeper can see no reason for her supersedure, but it may be that the bees are wiser, and are able to foresee her coming failure. Remember that in the ordinary course of affairs every queen is superseded when from two to four years old.

Winter Preparation of Bees, Etc.

1. What time must I prepare my bees for winter?
2. How many pounds of honey should each colony have for winter?
3. When must I begin feeding for winter?
4. Which is the cheaper, 20 pounds of extracted honey or 20 pounds of syrup made of coffee A sugar?
5. Must the frames be as they were all summer—the most honey on the sides?
6. Must I examine them during the winter? I will leave them on summer stands.
7. How often should bees be examined thru the spring and summer?
8. What is a colony of bees worth in a new Langstroth dovetailed hive (fall and spring)? TENNESSEE.

ANSWERS.—1. Preparation for winter should really begin about Sept. 1, or even the middle of August in some places and some seasons, by seeing that the bees have plenty of stores for winter. Packing or other preparation of that kind may take place as soon as the weather becomes too cold to allow the bees to fly nearly every day.

2. For out-door wintering not less than 30 pounds of honey.

3. Just as soon as you are satisfied that bees will gather no more than will supply their daily needs, even if that's in August.

4. That depends altogether upon the prices you have to pay. It will take about 14 pounds of sugar to make a syrup equal to honey, so you can answer the question by finding out which will cost less, 14 pounds of sugar or 20 pounds of honey.

5. They will do all right just as they are. Farther north it may be advisable to have the honey all on one side.

6. No; do the best you can to have them well supplied and tucked in for winter; then let them severely alone till warm weather comes in spring.

7. There is no one price for all localities. In some places they are worth twice as much as in others. Consult the prices named at different times in the advertising columns of this journal, and you will have some idea of the matter.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Engene Secor, Forest City, Iowa.

VOL. 39. SEPTEMBER 21, 1899. NO. 38

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Philadelphia Convention Notes.—On Monday afternoon, Sept. 4, we started from Chicago for the 30th annual convention of the United States Bee-Keepers' Association. Like many others, we went over the magnificent Pennsylvania railroad, arriving in Philadelphia about 6 p.m. the following evening, after a ride of 27 hours. We immediately went to Franklin Institute. At the entrance were found Messrs. Doolittle, Hutchinson, Selser, Mason, E. R. Root, Coggshall Bros., Abbott, and others. By the time the convention opened quite a respectable number had gathered. Pres. Whitcomb was on hand, as well as Mrs. Whitcomb and Mrs. Mason.

The convention started out well, and bespoke a good meeting. All seemed ready to take part in the discussions, especially Mr. Selser, who feared the harmful results of the importation of Cuban honey upon the honey markets of the United States. But more of this will appear in the report of the convention proceedings.

Drs. Miller and Mason, as well as Mr. Abbott, did much from the start to put life into the meeting. Pres. Whitcomb was ready to do his part, and Secretary Mason had his hands full in looking after the program.

The Philadelphia Bee-Keepers' Association, composed of some 80 local apiarists, "did themselves proud" in entertaining the visiting members of the convention. Special mention should be made of Messrs. Wm. A. Selser and Secretary Hahman. They were untiring in their efforts, and lavish in their expenditure of time and money.

Mr. Selser lives ten miles north of the city, where he has his apiary and honey-bottling works. Of these latter

we will have more to say later. Mr. Selser took six members home the first night, and nine the next. And all were royally entertained. Mrs. Selser is a charming hostess, and every one fortunate enough to be a guest at the Selser mansion was delighted. We know of at least *one* member who felt so much at home that he really didn't care to leave.

We must tell "one" on Dr. Mason. He took supper at Mr. Selser's the next day after the convention. At the table Mrs. Selser, in her winsome way, said that she was glad that one bee-keeper had finally come that could eat a hearty meal. She seemed to think that none of the other Western or Southern bee-keepers who had been there had good appetites. But Dr. Mason made up for all the rest. His capacity was ample; and his ability to cause tempting viands to disappear was remarkable. Mrs. Selser appeared to be satisfied, tho Dr. Mason certainly must have been uncomfortable.

Prof. H. W. Wiley delivered one of the very best addresses we ever had the pleasure of listening to at a bee-keepers' convention. It was on the food value of honey, its adulteration, etc. Prof. W. is the chief chemist of the Department of Agriculture at Washington, D. C. We hope to be able to publish his address in full. It will be read with great interest and profit.

Mr. W. E. Flower, a member of the local association, and also the able conductor of the apiary department in American Gardening, gave an illustrated lecture on bees and bee-keeping, the second evening of the convention. He began by throwing upon the canvas a picture of the great Langstroth, and spoke in eloquent and fitting terms of his life and work. Then followed pictures of apiaries in and around Philadelphia. It was a very interesting feature of the convention, and Mr. Flower deserves a vote of thanks for his effort. It certainly was appreciated.

One picture showed Mr. F. manipulating the frames with bees in his own apiary. He said that just before the photograph was taken he wanted to go to the house and put on his "other clothes," but concluded that anybody could see that those were not his other clothes, so he let it go. His talk was punctuated with many such dry hits that simply captivated his hearers.

Another one was when he showed a picture wherein one visitor among the half-dozen or so in it seemed to be making a quick movement. Mr. Flower said that he was *stung in the rear*—but he quickly corrected himself by saying that he was in the rear when stung. The audience must have finally concluded that both statements were likely correct, for when they fully comprehended the joke, they simply let themselves loose with a roar and hand-clapping that were deafening.

We should have mentioned before that during the first session, Tuesday evening, the local association, at no small expense, had provided some fine musical talent in the way of solos. A lady and gentleman each sang twice, we believe, and all seemed to appreciate their singing very much. There was a good attendance at that first session, which augured well for the success of the annual gathering.

The following day after the convention Mr. Selser took us and several others in his two-seated carriage, with high and fast stepping sorrels, about a 30-mile drive over the surrounding country, which is covered with the mansions and estates of the wealthy Philadelphians, such as John Wanamaker, Mr. Curtis, of the Curtis Publishing Co., publishers of the Ladies' Home Journal; also a Mr. Harrison, of the Havemyer sugar trust, the latter's castle costing about three hundred thousand dollars. Also we saw Mr. Cramp's place, one of the great ship-builders. But perhaps the most delightful of all was the drive along the old Wisshickon River. It was by far the finest ride we ever had.

We stopt a few minutes at a little, old hotel which was there in Washington's time, and no doubt he used to stop there when he went that way. The drive-way for some ten miles winds along the beautiful river with its ever changing scenery of grand old trees, jutting rocks, deep cuts, and high ledges. All united made a scene long to be remembered. Everything is kept in its original beauty, no one being allowed to touch a thing, or even to carry off a fern or other memento of the aged surroundings.

On Saturday, Sept. 9, we spent the day in Atlantic City, N. J. It was the first time we had seen the sea, and being in such a famous summer resort where thousands of visitors bathe in the surf, of course we had to don a bathing suit and enjoy it with the rest. We not only got into the Atlantic Ocean, but some of the Atlantic Ocean got into us. It tasted very bitter, too.

In the evening we returned to Philadelphia, and the next day attended John Wanamaker's Sunday school, known as the greatest in the world. "John" was there, and about 4,000 more who were regular members of the school. Mr. W. is the superintendent. It is indeed a most wonderful Sunday school. Be sure to visit it if you are ever in Philadelphia on Sunday. It is located at the corner of 22nd and Bainbridge streets, and meets at 2:30 p.m. It was indeed a fitting close to our stay in the old "City of Brotherly Love."

We shall always remember our visit to Philadelphia with much pleasure, and hope some time to be permitted to go there again, and stay longer.

But next year (don't forget it) the bee-keepers' convention will be held here in Chicago, at the same time as the Grand Army encampment. Then we want to see the largest gathering of bee-keepers ever known in this country.

Bees in Paraguay.—U. S. Consul, Hon. John Ruffin, writing for the American Bee-Keeper, from Asuncion, Paraguay, South America, says this about bees in that part of the world:

"There are several kinds of wild bees in Paraguay, some of which build in subterraneous holes, the rest in hollow trees. Two years ago a colonist made a trial, to improve one of the latter, by gathering them into a proper hive, apparently without satisfactory results. If not all, at least some kinds are said to be without a sting, but one, a black bee of medium size, attacks the intruder by clipping the hair as if cut with scissors.

"Some years ago a German, von Gulich, introduced the European bee, and succeeded well, using modern hives according to Dzierzon's method; his widow has continued this industry, and a few colonists followed with more or less success. Honey finds ready sale at good prices, likewise the wax, which is used extensively for making candles and matches."

The Flatness of the Honey Market is attributed by R. H. Mitchell, in the Country Gentleman, among other things, to the quality of the honey marketed. It is the same thing that hurt the cheese market, the effort to increase quantity without regard to quality. "Honey left in the hive until sealed up by the bees is one thing, but honey extracted as fast as stored and sealed in a glass package is quite another."

Langstroth on the Honey-Bee, revised by the Dadants, is a standard, reliable and very thoroly complete work on bee-culture. It contains 520 pages, and is bound elegantly. Every reader of the American Bee Journal should have a copy of this book, as it answers hundreds of questions that arise about bees. We mail it for \$1.25, or club it with the Bee Journal for a year—both for only \$2.00.

The Premiums offered on page 606 are well worth working for. Look at them.

DR. S. C. SCHMUCKER, of the Department of Biology of the State Normal School at West Chester, Pa., delivered a bee-lecture at the Mt. Gretra Chautauqua, July 18. Dr. Schmucker is an earnest and enthusiastic nature-lover, and has gained many disciples among teachers in the public schools, especially for Nature Study. The talk was entitled, "A Co-operative Community." The life history first of the bumble-bee, and then of the carpenters and leaf-cutters formed an interesting introduction to an account of the manifold activity of our hive-workers, with their high social organization.

MR. MCNAY IN A "CROW'S" NEST.—Rambler, the versatile writer from California for Gleanings in Bee-Culture, was visited by Mr. F. McNay, of Wisconsin, last winter, when the latter bee-keeper was "doing" a portion of the Pacific Coast. It seems they spent a night with a Mr. Crow, one of California's bee-keepers. Here is the way Rambler "Crow-ed" about the matter:

"The uncapping-can handed down by a former owner was so novel that it took the eye of Mr. McNay. It was merely a rude frame with a gunny-sack attached to the upper portion. A slit in the bottom of the sack allowed the attachment of a good-sized dish-pan perforated with many holes. Mr. McNay said they had no such things in Wisconsin. One of the honey-houses was a substantial affair, and built of stone. A stone honey-house is a very desirable building in this country. It is cool in summer, warm in winter, fire-proof, and not handy for burglars to break thru and steal.

"After the honey-business had been discust to a considerable extent, we were shown the adjacent gold-mines. Mr. Crow's mine was in the course of development; but a neighbor miner had cut a tunnel several hundred feet into the mountain, and had a large amount of low-grade ore in sight. Mr. McNay was informed that the mine could be purchast for about \$40,000. Now, if the mine had been worth two or three hundred thousand dollars Mr. McNay would have used a portion of the fortune he has accumulated from the honey-business in Wisconsin, and purchast the mine; but he did not want any cheap \$40,000 mine on his hands.

"After our arduous day's work, tired Nature asserted her rights, and we prepared to go to roost, and Mr. Crow insisted upon giving up his nest to us. Mr. Crow is not a tall man, and his nest was made according to his needs. I could manage the nest very well; but tall Mr. McNay had to make rafters of his legs, or poke his knees out in front or into my ribs, or project his feet out at the foot of the nest. He managed very well until he dropt asleep, then his feet would start right off toward Wisconsin, and hang out like twin specters in the dim moonlight. Having in mind the old adage about keeping the head cool and the feet warm, I was extremely anxious for his welfare, and anxious to have him return in safety to Los Angeles and Mrs. McNay.

"To allow a man to expose his bare feet all night, even in California, is no trifling matter, and the case was more aggravating when we consider that Mr. McNay was a tenderfoot. My only remedy was to give my nest-fellow a shake, and shout, 'McNay, pull in your feet!' He would promptly obey every time, and keep right along snoring.

"Mr. Crow had curled himself up in a cot on the other side of the cabin, and he soon began a snoring duet with Mr. McNay. Between the nasal music and the care of my companion's feet, I slept hardly a wink during the night. In the morning Mr. Crow remarkt about my haggard appearance; but I knew if I told them the cause of my sleeplessness, they would both contradict me right from the shoulder, and I suffered in silence."

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

Hoffman Frames seem to be quite popular in Australia. In the Bee-Bulletin its objections were asked for, and one thought the spacing too narrow; another objected to the propolizing and the difficulty of uncapping with so wide a top-bar, but the greater number had no objection.

Straw for Smoker-Fuel is used by some Wisconsin bee-keepers, says the Bee-Keepers' Review. A good fire is started in the smoker, and then the straw is jammed in. It burns a long time, and is not so hot as wood. A burning straw-stack, smouldering for days, suggested the idea to Mr. N. E. France.

Setting Bees to Work in Shallow Extracting-Frames before Putting on Sections, is a plan highly commended in Gleanings in Bee-Culture, but the British Bee Journal does not think it advisable, as by the use of one or more bait-sections bees can be induced to work with sufficient promptness in sections without first using extracting-frames.

"Victory Thru Defeat; How the Association Has Scared the Adulterators in Chicago," are the head-lines of an editorial in Gleanings in Bee-Culture. The editor quotes at length the report of the case given in this paper on page 552, takes heart from the result, and ends by saying: "Hurrah for the Association! Give it your support with dollars."

Crimson Clover, says R. L. Taylor, in the Bee-Keepers' Review, is chiefly valuable as a "catch" crop, should never be sown in spring, but as early in July or August as the ground is moist enough, and may be cultivated in at the last working of corn, or barrowed in on oats stubble as soon as the oats are off. He says: "It blooms here [Michigan] the latter part of May, the following year, in time to be followed by corn. At that time it is a great aid to the bees. It is excellent food for all stock, *except* when dry it is dangerous for horses, as the large heads are liable to become impacted in the stomach."

Foul Brood Cure.—In the Bee-Keepers' Review, Mr. Taylor refers to the directions for curing foul brood by H. W. Brice, the British authority, as lately given in this department, the cure involving 24 hours' confinement, re-hiving, re-queening, and feeding medicated syrup daily for at least two months. Mr. Taylor then says: "That should please Editor Root in point of safety, but it would be a great and unnecessary burden, and is neither science nor economy. To shake the bees into a hive furnish with foundation during a honey-flow, keeping all infected combs and honey strictly from other bees, is just as safe, with one-tenth the trouble and expense."

Do Queenless Bees Start a Succession of Queen-Cells?—A "Stray Straw" in Gleanings in Bee-Culture is as follows:

"Editor Hutchinson says his bees don't do as mine do. His start all cells at nearly the same time, and so nearly of an age that they emerge from the cells within the same two days. As he's a queen-breeder and I'm not, that shook my confidence in my own observations. But that veteran queen-breeder, Henry Alley, who has reared many more queens than both of us put together, says I'm right. He says: "When I have removed a queen from a colony for the purpose of introducing another, I find, after waiting three days, cells nearly ready to cap, while there are others just started."

Fences versus Plain Separators. Gleanings in Bee-Culture has the following "Stray Straw":

"A surprise has met me. A dozen or so supers were filled with sections, one side old-style sections with plain separators, the other side with plain sections and fences. In every case where there was a difference, and I think there was a difference in every case, in some cases a marked difference, the difference was in favor of the old style, the bees beginning sooner and finishing sooner. I don't un-

derstand it. I could understand it if there were no difference, but why the bees should do worse with freer communication is beyond me. Is it pure prejudice on the part of the bees? [This is indeed a surprise when most of the reports have seemed to be the other way. But in the interest of fairness and truth, I desire that this item should be as widely circulated as the items of the other character. If there is any advantage in a solid separator, such separator could be used with the plain sections; but in that case it will be a cleft separator. But plain sections with the same filling are preferred by the buyers. I take it that you yourself are partial to tall sections, from what you say on page 601, and that you are afraid that you will have to adopt them. Is it the tallness or the general appearance of the boxes, or what, that makes you think that way?—Ed.]"

Introducing Queens.—Editor Hutchinson has had reports from a number of customers who have introduced queens by means of the wire-cloth cage, with the wires thrust into the comb. There were a few failures because the cage was put on comb not old and tough enough, and the bees gnawed under to the queen before they were ready to accept her. But most failures came from opening the hive and looking up the queen in a day or two after she was released, to see if she was all right. The disturbance alarmed the queen, she ran and squealed, and the bees took after her. Then the next time the hive was opened she might be missing. Mr. Hutchinson is very emphatic that a colony should be left entirely undisturbed for several days after the queen is released until she has fully regained her normal condition and is thoroly established as queen of the colony.

As additional security, W. H. Pridgen proposes leaving to the bees the job of releasing the queen. Make a hole thru the comb back of the cage, fill it with candy, and the bees will do the rest.

Tin versus Wood for Extracted Honey.—"The American Tramp" objecting in Gleanings in Bee-Culture to the square cans for extracted honey, the editor replies in part as follows:

"It is G. W. York, editor of the American Bee Journal, who is arguing for square cans as against kegs and barrels; but as I agree with him in the main I come in for my share of your criticisms.

"In the first place, let me say that Mr. York, altho it is not generally known, handles large quantities of extracted honey. Indeed, I venture to say that he has had considerably more experience with square cans, and kegs and barrels, than any dozen average producers all together, and his verdict is emphatically in favor of the tin packages.

"One of your objections to the square cans is the difficulty of getting honey out of them; and that, therefore, the dealer will not sell from them because of that fact. Why, my dear sir, square cans have honey-gates the same as kegs and barrels; and the matter of convenience in retailing is, to my notion, far ahead of the leaky wooden things. Nearly all of the dealers' catalogs will be found to illustrate a very neat little honey-gate for square cans, costing 15 cents, or mailed for three cents extra for postage. Every user of square cans should supply his grocer with one of these little gates; then the operation of drawing a pound, a quart, or a gallon, is as simple as putting up so much sugar."

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

The New Edition

—OF THE—

*** A B C ***

—OF—

BEE-CULTURE

Now Ready

Before the next issue of American Bee Journal is out we hope to have the new edition of the A B C book in the hands of those who have had their orders with us so long. The new book will be, in many respects, far ahead of any of the previous editions, both in typographical appearance and general subject-matter, for we are now building upon the knowledge and experience of these latter days, when such wonderful developments have been made all along the line.

The subjects of "Apiaries" and "House-apiaries" have been recast. "Crimson Clover" is a new subject. The subject of "Bees" has been enlarged to take in *Apis dorsata* and other races of bees. "Comb Honey," as well as "Comb Foundation," has been rewritten from beginning to end, besides considerably more being added. The subject of "Hive-making" is entirely recast. In the former editions, only one hive was described in detail. This was followed with matter showing how to make hives, sections, etc., by power machinery. No particular hive is now described in "Hive-making," and the matter is simmered down to the processes of cutting up stuff on foot-power and light-power machinery. As to dimensions, the reader is advised to send to some manufacturer for a sample standard hive in flat, and from the parts of this secure his measurements. "Hives," an entirely new subject, contains a description of all the best ones. Among them may be seen the old-style Langstroth, the Simplicity, the Dove-tailed Langstroth in its various forms; the Danzenbaker, the Heddon, the Dadant, and, under this head, large and small hives. This is followed by a discussion on double-walled or winter hives. Various principles are illustrated, all the way from the loose to the closed-end frame. The subject of "Hives" is followed by three more new subjects, "Honey as a Food," "Honey-Cooking-recipes," and "Honey-peddling."

The new book contains the same number of pages as the old one, and will be sold at the same price—\$1.20 postpaid; or clubbed with GLEANINGS IN BEE-CULTURE for one year for \$1.75.

ADDRESS

THE A. I. ROOT CO.
MEDINA, OHIO.

In the multitude of counsellors there is safety. Prov. 11-14.

Foul Brood and Pickled Brood.

Query 104. 1. Briefly give the location and effect of foul brood, giving one or more causes. 2. The same as to pickled brood. COLO.

- Eugene Secor—No experience.
- Mrs. J. M. Null—No experience.
- Dr. J. P. H. Brown—No experience.
- Prof. A. J. Cook—I don't understand.
- Mrs. L. Harrison—Have had no experience with either.
- R. L. Taylor—Your question is quite unintelligible to me.
- O. O. Poppleton—Have no experience with either disease.
- S. T. Pettit—I don't know enough about either to write about them.

W. G. Larrabee—I have had no experience with either foul or pickled brood.

G. M. Doolittle—Get Howard's treatise on foul brood. Too long for this department.

Dr. C. C. Miller—See back numbers of this journal, and get Dr. Howard's foul brood pamphlet.

D. W. Heise—1. Leave this for the foul brood experts. 2. Read up Dr. Howard on pickled brood.

Adrian Getz—1. See Dr. Howard's foul brood book. 2. See American Bee Journal of Sept. 10, 1896.

J. A. Green—Read the books and articles on this subject. There is not room here for what is askt for.

J. A. Stone—1 and 2. I have never had any experience with either, and so know nothing about them.

A. F. Brown—1. Thruout the brood-nest. Effect—destruction of the colony. 2. No experience with pickled brood.

C. H. Dibbern—1. In my more than 30 years' experience I have never seen a case of foul brood, and personally know nothing about it.

R. C. Aikin—1. What do you mean by "location?" It is in the larval brood—kills them. I do not know the cause, except infection. 2. I think I never saw it.

J. M. Hambaugh—1. Foul brood is a microbe disease, transmitted thru honey infected with the organisms. 2. As to pickled brood, it may happen from various causes.

E. Whitcomb—Plenty of it in this locality. Brood dies instead of maturing, generally while in the chrysalis stage. The colony soon dies of old age. Robber-bees carry it from infected colonies to stronger ones. 2. I don't know.

Emerson T. Abbott—I have had no experience with foul brood, and have seen only one case in all my experience with bees. In fact, I am glad to be able to say that I know but very little about the diseases of bees, from experience.

C. Davenport—1. I have had no experience with foul brood, and sincerely hope I never will have. 2. Pickled brood severely

METAL WHEELS
in all sizes and varieties, to fit any axle. They last forever. Either direct or stagger spoke. Can't break down; can't dry out; no resetting of tires. Good in dry weather as in wet weather. Send for catalog & prices. **ELECTRIC WHEEL CO.,** Box 16, QUINCY, ILL.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------------|-----|--------|--------|--------|
| Sweet Clover melilot | 60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | 70c | 1.25 | 3.00 | 5.75 |
| White Clover | 80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | 60c | 1.20 | 2.75 | 5.00 |

affected most of my colonies one season, and to a less extent the next; it cured or disappeared of itself. Various remedies I tried did not seem to help matters any. I don't know the location; the effect is to weaken a colony. I don't know the cause.

G. W. Demaree—There has never been a case of "foul brood" (so-called) in central or northern Kentucky, except a few cases near Cincinnati, O. on the Kentucky side of the Ohio River, and therefore I have never seen a case of "foul brood."

Dr. A. B. Mason—1. The "effect of foul brood" is to depopulate the colony if badly affected. There is but one cause, and that is contagion, and the foul brood is located in the brood, and is caused by foul-broody honey. 2. I don't know anything about it.

J. E. Pond—2. I don't know anything about pickled brood. 1. As to foul brood, it has been so fully described in works on apiculture and the bee-papers of the day, that I advise the study of the subject from them. It would require too much space to give an intelligent answer here.

Rev. M. Mahin—1. Foul brood is located in the brood-nest of a bee hive, and among the brood. The effect of it is to kill the brood and ruin the colony. There is only one cause—contagion. 2. I do not know anything about pickled brood, but I know more about foul brood than I want to.

P. H. Elwood—1. The immediate cause is the bacillus peculiar to the disease. Any weakness or filth, I suppose, renders bees less able to throw off or resist the disease. Dead brood without the bacillus present does not cause it. 2. Pickled brood in its earlier stages resembles foul brood. Later it lacks the ropiness and characteristic odor of foul brood. One will never run into the other. Pickled brood is sour; foul brood is not.

Mrs. A. J. Barber—1. Location—wherever bees have had access to foul-broody combs or honey. Its effect is to destroy the brood, thus ruining the colony. I have handled a great many cases of foul brood, and have come to believe that it is always caused by bees having infected combs or honey given them, or by robbing such combs or honey. In short, it takes foul brood to start foul brood. 2. I have had no experience with pickled brood.

E. S. Lovesy—1. It is a disease of the brood. The living bees are not affected by the disease, but when they come in contact with it they can carry it on their bodies and introduce it to the larvae of any hive they may enter. The effect is, if it is not cured it will cause the destruction of the colony. Under certain conditions the cause is sometimes thru foul or rotten brood. 2. Pickled brood with us floats in the atmosphere like typhoid fever; when it is prevalent it may strike any locality. Here in Utah, as a rule, a handful of equal parts of salt and sulphur sprinkled over the brood, from one to three dressings, will cure this disease.

Did Only Fairly Well.

Bees did only fairly well this year—50 to 80 pounds of comb honey per colony, for good colonies; in old-fashioned "gums," only 0 to 15 pounds per colony.

H. I. McCoy.

Columbia Co., Ark., Sept. 5.

Have Had a Pleasant Summer.

We have had a pleasant summer so far, and had it been a wet season the crop of honey would have been immense, for the weather was just right for nectar-secretion.

The anxiety of the many buyers of

honey is very unusual, proving the scarcity of honey; and yet prices are not high, considering the shortage in the honey-crop.

M. H. MENDESON.

Ventura Co., Calif., Aug. 29.

Drouth Stopt Gathering.

Bees did fairly well this season. I will get 2,500 pounds of comb honey from 55 colonies, spring count. The present great drouth has stopt all gathering of honey for over a month.

WM. M. DICK.

Ford Co., Ill., Sept. 5.

Bees Doing Nothing.

Bees have done nothing since the middle of July. They are eating their stores, and if it keeps on this way we will have to feed soon.

FRED ROBY.

Hall Co., Nebr., Aug. 30.

No Honey This Year.

I have no honey this year. Bees came out in the spring in fine shape—10 colonies, all wintered well. I shall not get honey enough to pay for the Bee Journal. It was too dry here in June, which is our honey season. Bees are working well now, but will not store more than enough for winter.

F. D. KEYES.

Hampshire Co., Mass., Sept. 1.

Too Dry Weather for Bees.

My bees have not done any good for the last two months, because of dry weather. Last spring they did well. I have gotten only 10 pounds of honey from seven colonies.

I could not get along without the American Bee Journal. It is all right.

G. W. MAUK.

Oklahoma Co., Okla. T., Sept. 9.

Bees Wake Up Denver People.

[Mrs. Emma Woodmansee, of Arapahoe Co., Colo., sends us the following exciting experience with a swarm of bees, which appeared in the Denver Evening Post early in July:

In some favored, flowery section on Capitol Hill, in a populous bee-hive, a queen-bee was born, and there was a buzz of rejoicing.

At high noon to-day, the queen attained her majority, and, in obedience to the suggestion of her courtiers, sallied out of the hive with the entire junior generation at her heels to find a new home for her clamorous subjects.

The party took a westward course and, the wind being fair, it went humming straight down Sixteenth Street.

At the intersection of Curtis and Sixteenth Streets the queen's courtiers espied the little yellow truncated pyramid on which the street-car flagman takes his rest. He was taking it as the bees came along.

"My eyes, if it ain't a hive!" exclaimed the queen's privy counsellor.

"It is," said the queen, "and a brand new yellow one. We will camp right here." And they at once began to do so.

"What the div—? Wow!" cried Flagman Patrick J. Walsh, as an inquisitive honey-maker climbed into his trouser leg and gave him a pointer to get up.

"Whoosh! Shoo away from here!" he yelled.

But the bees wouldn't "whoosh." There had been bees since God said, "Let there be light," and there would be bees when Patrick Walsh had ceased to be. What cared they for Patrick Walsh? They didn't do anything at all, but just piled into that pretty new hive at every aperture, and Mr. Walsh moved away at a lively rate.

"There were eight million, nine hundred and seventy-seven of 'em by actual count," said he.

A little fuzzy dog saw the people gath-

ered on the four corners watching the swarm and boldly went out to investigate. "I don't see nothin' but a few bees," said he to himself, as he went up close to the box and gave it a sidelong glance. And then 43 bees with one accord lit on him, and such another "Ki-yi!" as he let out had not been heard since the Fourth. He went down Sixteenth Street at a speed impossible to estimate. Before anybody could get a watch on him he was gone.

"I never see sich a sudden, evanescent dog in my life," said a man who peep from behind the mail-box on the corner.

Then the cars came from four directions. Every time one past thru the swarm there were, "Oh, Lordy's," and shrill shrieks, "We e-e-e!" like that. And still the bees swarmed.

"I'll get 'em out of the way," said a little man who knew all about bees, and he rusht out and pickt up the box. "All you have to do," he called out, cheerily, "is to hold onto the box till the bees all get in and then carry 'em off. They're—oh, holy, jumpin' je-hoshyphat!" he concluded, and dropt the box and ran.

Later the police were called out. Officer Hunt took a broom and stood holding it up in the manner of liberty enlightening the world. That is, he held it up for awhile and then the bees held him up, stampeded him and he had to retire.

Meanwhile the crowds thickened at the corners.

"It's the busiest day we've had in Denver for 10 years," said a man who had made a run for it from Joslin's Coruer to Scholz's drugstore.

At last somebody got a bucket and substituted it for the box. He turned the receptacle bottom upward and hived the most of them and carried them off, chased hotly by those remaining outside.

The casualties were 800 cases of feminine fright, and 138 good, old-fashioned bee-stings.

[For downright fun, commend us to the sight of a swarm of bees among a lot of people who know nothing about them, and this includes the average newspaper reporter who always overworks his imagination, as is clearly shown in the first two paragraphs of the foregoing "bee-story." But then, that is usually their part of the fun, which also makes it all the funnier for the bee-keepers who read it. Laughing is a healthy exercise. That is our excuse for republishing this Denver wake-up. We trust that all our readers will enjoy it as much as we have.—EDITOR.]

Just Rolling in the Honey.

Bees are just rolling in the honey. We are getting one of the best flows we have had in four years.

A. J. FREEMAN.

Neosho Co., Kans., Sept 12.

Bees Did Very Well.

Last winter I lost half of my bees, and the balance, 10 colonies, were in poor condition; I increased them to 17 colonies, all in good condition at present.

Basswood lasted 15 days; it never was better, but there were not bees enough to care for it. The fall flow seems very good. Clover didn't yield any nectar. Honey sells like hot-cakes. I extracted 400 pounds, and had 24 pounds in sections.

A. F. KRUEGER.

Washington Co., Wis., Aug. 11.

No Fall Surplus Bees and Grapes.

There is no surplus honey for this fall. Bees are working on buckwheat and goldenrod, doing their best to lay up a store for winter.

I wish some of our scientific bee-keepers would help me out of a controversy that I had with a neighbor. He took me into his grape arbor and showed what the bees had

Golden Italian Queen Free For sending us One New Subscriber.

done with his grapes. I tried to convince him that the bees had merely carried the juice away, but did not pluck the grape. His reply was that he saw with his own eyes the bee pluck the grape with its mandibles. I told him I would give him one dollar a bunch for every one that the bees would pluck, to be laid in my bee-yard.

F. McBRIDE.

Hardin Co., Ohio, Sept. 17.

Common Figwort.

Please name the plant specimen which I enclose. The plant grows to a height of from five to nine feet; commences blooming from the middle of June to the first of July, and continues till frost. The bees are continuously at work on the flower of the plant from daylight till dark.

Platte Co., Mo. J. L. LEWIS.

The plant is the common figwort, which will be found illustrated on page 368 of my

"Bee-Keeper's Guide." It is surely one of our best honey-plants. The flower will often be found full to the brim of nectar. It is not a showy plant, but as "handsome is that handsome does," it is fine.—A. J. COOK.]

The Man Who Drinks.

The Memphis Commercial Appeal says: "The business world recognizes that no man who drinks is as good as he would be if he never drank. Time was when in certain lines of business it was considered necessary to drink. Quite on the contrary is the case now. Even saloon men prefer bar-keepers who do not drink the liquids they sell. All the fairy tales about the great things people do when under the influence of liquor have been exploded. The orator who must be intoxicated in order to make a speech is no longer here, and he has never been here. The lawyer who cannot plead a case or cite an authority with-

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife. We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal with \$3.00, and we will also send to each new name a copy of the Premium Edition of the book, BEEs AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.,

out spending the night before in a bar-room, has gone to visit the pale glimpses of the moon, and he has always been gone. The writer who produces a great poem or a great essay while maudlin, was removed from this planet before the command, 'Let there be light' was given. The book-keeper, clerk, mechanic, salesman, artisan, young or old, is not at his best while under the influence of liquor, and he is not as valuable to himself, his employer, or society. In the race of life the temperate man has the best of it; the drinking man is handicapped. The sober man is always an improvement on the drunken man."

Convention Notices.

Utah.—The Utah Bee-Keepers' Association will hold their semi-annual convention in the City and County Building, Salt Lake City, Oct. 5, at 10 o'clock a.m. A full program in the interest of the industry will be presented. All are invited. Some prominent bee-keepers are expected to be present, and one or more meetings may be held at the State Fair.
J. B. Fagg, Secretary.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held at the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1899. All are cordially invited.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co., 118 Mich. St., Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth, the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 466 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle. A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 351 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode German, by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire. Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Cappings and Capping, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about capping, fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Sept. 7.—Fancy white comb honey, 15c; No. 1, 13¹/₂ 14c; light amber, 11¹/₂ 12c; dark amber, 9¹/₂ 10c. Extracted, white, 7¹/₂ 8c; amber, 6¹/₂ 7c; dark, 6¹/₂ 7c. Bees-wax, 25¹/₂ 26c.

Consignments of small lots of comb honey are becoming more frequent, and while there are some who will not buy at the prevailing price, yet a fair trade is being done; this also applies to extracted honey and beeswax.

R. A. BURNETT & CO.

KANSAS CITY, Sept. 14.—The supply of comb honey is very light. Scarcely any extracted on the market. We quote fancy 1-pound comb, 14¹/₂ 15c; No. 1, 13¹/₂ 14c; No. 1 amber, 12¹/₂ 13c. Extracted, white, 7c; amber, 5¹/₂ 6c; dark, 4¹/₂ 5c. Beeswax, 22¹/₂ 25c.
C. C. CLEMONS & CO.

NEW YORK, Aug. 22.—Demand good for new crop comb honey, excepting buckwheat. We quote as follows:

Fancy white, 14¹/₂ 15c; No. 1 white, 12¹/₂ 13c; fancy amber, 11c; No. 1 amber, 10c. Extracted firm at unchanged prices. Beeswax dull at 25¹/₂ 26c.
HILDKETH & SEGELKEN.

SAN FRANCISCO, Aug. 25.—White comb, 11¹/₂ 12c; amber, 9¹/₂ 10c. Extracted, white, 7¹/₂ 8c; light amber, 6¹/₂ 7c. Beeswax, 20¹/₂ 27c.

Market is firm at unchanged quotations, with demand lax and offerings light. The last Panama steamer took 312 cases extracted for New York. The ship Centesima sailed with 34 cases for Liverpool; another took 4,000 lbs. beeswax.

CLEVELAND, Aug. 18.—New honey scarce and in good demand. Fancy white, 15c; No. 1 white, 13¹/₂ 14c; fancy amber, 12c; No. 1 amber, 10¹/₂ 11c.
A. B. WILLIAMS & CO.

BOSTON, Sept. 8.—Fancy white comb, 1-pound sections, 16c; A No. 1, 14¹/₂ 15c; No. 1, 12¹/₂ 13c; No. 2, 11c. Light amber extracted, 8¹/₂ 9c; amber, none to quote. Beeswax, 27c.

Practically no new comb honey has been received as yet, and stocks are steadily being reduced, so that there is really no honey on hand, with quite a little inquiries. We strongly advise shipments of comb honey to be made as early as possible.
BLAKE, SCOTT & LEE.

BUFFALO, Sept. 16.—Extra fancy one-pound comb sells well at 13¹/₂ 14c choice, 11¹/₂ 12c; dark, 10 cents down, as to grade. Demand much better. Receipts light.
BATERSON & CO.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14¹/₂ 15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7¹/₂ 8c.
PEYCKE BROS.

DETROIT, Sept. 11.—Honey-producers accustomed to trading in Detroit have had work to satisfy local trade. Very little honey in market. White comb, 14¹/₂ 15c; dark, 12¹/₂ 13c. White extracted, 7¹/₂ 8c. No dark wanted. Beeswax, 23¹/₂ 25c.
M. H. HUNT & SON.

WANTED. Comb and extracted honey; state price, kind, and quantity.

AMERICAN BEE JOURNAL.

ESTABLISHED IN 1861 OLDEST BEE-PAPER IN AMERICA

DEVOTED EXCLUSIVELY TO THE INTERESTS OF HONEY-PRODUCERS.

39th YEAR.

CHICAGO, ILL., SEPTEMBER 28, 1899.

No. 39.

CONTRIBUTED ARTICLES

The Home Bee-Yard-- Quadruple Hives.

BY E. FRANCE.

THIS picture shows a part of our home yard of Langstroth hives, made to hold four colonies each. We work them for extracted honey, 8 frames in a set, 3 tiers high, making 24 Langstroth frames to each colony. We could use them higher if we wanted to, but we think 3 is about right.

How do we manage those hives? I will commence in the spring of the year. When fruit-trees and dandelions are in blossom we set our hive-tent over one of the hives, put all the brood into the bottom story, honey into the second story, empty combs up into the third story, and clip the queen. If there is more brood than enough to fill the bottom story, we give it to any colony that lacks enough brood to fill the lower part (8 frames). We aim to have every colony have 8 brood-combs at this time of the year, and we usually find enough brood in the yard to give all eight brood-combs, and have some to make a few new colonies, after going over the yard in this way.

We don't do anything more until we find they are getting more than a living. If there is clover, about June 15 we go over the bees again, see that all have 8 brood-combs, and make new colonies with the surplus brood-combs.

Now, if we have a good flow of honey from clover, we will soon commence to extract, keeping the brood in the lower story, and extracting from the two upper ones. We watch the honey-sources closely, and aim to have the upper set of combs full at the close of the basswood honey-flow.

I used to take off the third stories in September or first of October, and see that the second story was full of honey, but the last two years I have left the third stories on full of honey, and find the bees have wintered splendidly in that way. They came thru the winter strong, and no spring feeding needed to be done.

Quadruple Hives in Mr. France's Home Bee-Yard.

If you want to winter bees out-of-doors, give them a large hive, and a good deal too much honey is just enough. If the bees don't use up all the honey you will get it when you begin to extract.

We use barrels to store our honey in. They are much the best, easier to handle, and safer. Grant Co., Wis.

The Honey-Bees Do Not Injure Grapes.

BY C. P. DADANT.

ANOTHER heavy grape crop is now on the vines in this vicinity, and yet we do not hear the usual complaint about bees eating grapes. It looks as if the uneducated grape-growers had at last come to the conclusion that the bee-keepers are right when they assert that bees cannot puncture sound grapes. But such is surely not the case, and the silence of the grape-growers comes from the fact that no damage is being done this year, for the very simple reason that, in this vicinity at least, the weather has been so dry that the grapes are not bursting, and altho the honey crop is short in the uplands, the bees have no occasion to annoy the horticulturist, for there are no damaged grapes for them to work on. The birds themselves, having a great abundance of wild cherries, of which they are very fond, do not carry on their usual depredations in the vineyard. It is only when the grapes are being pickt and

prepared for market that a few of the berries are bursted in handling, and a very few bees may be seen about them.

The prejudice among grape-growers in regard to the bees is very deeply rooted, and will take years to eradicate. Too many people judge of things by superficial observations, and decide a question by appearances and not by facts. When grapes are damaged, either by bursting, from rains, which send an extra amount of sap in the vine, or by the inroads of birds—thrush, cat-bird, quail, robin, etc., the bees take the blame, because they bodily take possession of the damaged fruit in broad daylight; and yet their role is only to save that which would otherwise be lost. But it is most difficult to convince the vineyardist that they are not the original causes of the trouble.

I remember being taken to task by an old Frenchman—a very good friend of mine, I must say—for keeping so many bees which were entirely destroying his crop of grapes, and his hopes of filling his cellar with the nectar dear to all Frenchmen. He said that if bee-keepers could not be made to see the folly of their ways, a law should be passed forbidding any one from keeping any more than 20 colonies of bees on one farm. "I have studied the matter," said he, "and I know exactly how they do. They always make two holes in a berry, one exactly above the other."

Upon this I protested, and held that it was the quail that made the two holes with both points of its beak. I even tried to show him, and it was plain to any one who was not entirely prejudiced, that the punctured berries were all on the same side of the bunch, because the holes had all been made, probably in the space of a few seconds, by a bird that had enough and amused itself, like bad boys in a melon patch, by plugging what it could not eat. But the bird had gone, and the bees were there, and it was of no use to try to defend them, when they were so willing to be seen. So my arguments, which I considered as conclusive and convincing, only served to make the man angry, and he would not speak to me for a year or more.

But what is the actual physiological position of the bees in regard to fruit? The honey-bee has mandibles or

Mandible of Hornet.

Mandible of Honey-Bee.

jaws, in the form of spoons, working vertically instead of horizontally, as in animals. These mandibles are horny and entirely devoid of teeth. They can be used only for the usual purposes of the hive, to mold the wax, build the combs, and handle and carry out any debris. They can use them to tear the corolla of blossoms or even leaves, and they also can tear cloth, by taking hold of imperceptible protruding threads and pulling them out, one after another, till a hole is made. But the hole that they make in a piece of cloth is ragged and uneven, it is torn, not cut. They have no sharp, saw-like jaws like those of hornets, and it would be as impossible for them to bite into the smooth skin of a fruit as it would be for a man to take a bite out of a smooth wall.

We have had as good chances as any one, perhaps, to make remarks and take observations on this subject, for we have had both bees and grapes, on a large scale, for 33 years in this country. We now have a vineyard of 13 acres, with an expected crop for 1897 of 30 tons of grapes. We have an apiary of about 90 colonies of bees on the same farm, and altho we have to be careful, when we crush our grapes to make wine, not to leave the juice exposed, we can say that we have never been to any real inconvenience by reason of the bee's love for grape-juice.

So give honor to whom honor is due. The bee is not the enemy of the horticulturist, but his friend, and I am glad to say that the better informed horticulturists have long ago found this out. The others will come to it, but it may take years to convince them of their mistake. It is a subject which must be brought before the public at regular intervals until the truth is taught in our public schools. It is as necessary to teach this as it is to assert that the earth turns around the sun, for those are facts which are absolutely positive, and yet cannot be proven by careless and casual observation.

Hancock Co., Ill.

[The foregoing article was sent to us early in September, 1897, and for some unaccountable reason was not pub-

lished. We are very glad to place it before our readers at this time, especially as the question of bees and grapes has been referred to of late in these columns. Mr. Dadant is entirely competent to speak on the subject, being a high authority on both bees and grapes.—EDITOR.]

Carniolan Bees, Dadant's Langstroth, Etc.

BY PROF. A. J. COOK.

THERE is no doubt that the Italian bee is a very great favorite with nearly all our American bee-keepers. Its peaceful habit, energy in gathering, courage to defend its hive, and ability to get honey from flowers not within reach of the common bee, have given it a wide and just reputation. I have never had experience with more than one other variety that was at all comparable with the Italian, that is with the Syrian.

The Syrian bee was thought by many to be too cross, but, after a little experience, I found it as easy to manage the Syrian as the Italian. While I think the Syrian is as good a bee as the Italian, I was never sure that it had any considerable superiority.

From my reading, I have long had a desire to know more of the Carniolan bee. Its reputation for amiability, activity and vigor, and especially its ability to withstand cold weather, seemed to give it superior excellence; indeed, so far as I know, there is only one disadvantage to this bee, and that is the tendency to over-swarming. As over-swarming results either from over-crowding of the hive or some discomfort within the hive, it may, in the hands of the wise bee-keeper, be no serious objection. If the Carniolan is so prolific that it speedily fills the hive with bees, and thus leads to swarming, surely that would be a recommendation. If lack of shade and over-heating leads the bees to leave the hive, then that objection could easily be remedied.

It was my pleasure, during the latter part of last July, to be in the East, and an exceeding pleasure to visit the apiary of Mr. Frank Benton. I there saw a large number of Carniolans from imported queens. As always before, when I have seen the pure Carniolans, I was very much pleased with their appearance. Their very large bodies and light-colored rings, formed by the gray hairs, make them indeed very attractive.

As I had never had any chance to study them I was of course interested to investigate their most pronounced superiority—amiability. We went to the hives late in the evening—Mr. Benton said it might as well be in the night—opened the hives with no smoke, and examined them without any bee-veils. As is well known, bees are often angered by quick motions or jars. Mr. Benton lifted a frame half way from the hive and let it drop, and yet there was no show of anger. He also struck at the bees with his hand, and blew on them roughly, and yet there was no show of resentment. From the size, beauty and amiability of these bees I am ready to regard them with much favor.

Mr. Benton—than whom there is no better authority—inform me that they rank with the Italians as honey-producers. He says that the comb is as white as that of the black bees, as these bees, like the black bees, leave a little space between the honey and the capping. Mr. Benton acknowledges that they do have the swarming instinct a little more pronounced than the other races, yet he thinks that this is induced, often, at least, by over-heating in the hive, and will give no trouble if the hives are properly shaded.

Mr. Benton also told me, a fact of which I was well assured before, that the pure Carniolan would never have a show of the yellow bands seen in the yellow races or the hybrids. In case the yellow does appear there is certainly some taint of blood, usually Italian.

From all my reading, and from what I learned from Mr. Benton, I believe that the Carniolan bees are well worthy of trial, especially by those who are timid when working with bees. I feel myself that I would like to go into the queen-rearing business, did my duties permit, and confine my attention to this race of bees.

DADANT'S "LANGSTROTH ON THE HONEY-BEE."

While visiting the American Bee Journal office, in August, the editor put into my hands the fourth edition of this excellent work. It divided my attention as I sped across the country on my homeward journey with the wondrous scenery of the Rocky Mountains. It is certainly a most admirable book. It called to my mind so vividly my

first reading of Langstroth's marvelous book, and the intense pleasure that I received from reading it.

Many years ago that grand man, Mr. Langstroth, spent a week with me at my home. He told me he wished to have his book revised, and asked my advice as to the best person to undertake the task. After thinking the matter over, I suggested Chas. Dadant & Son. I am very sure that this book proves that I was not unwarranted in so doing. Mr. Dadant's wide and able experience enables him to bring the book up to date, and of course that was all that was needed, or all that any wise person would have undertaken.

There are a few points that I should call in question, which I propose at some future time to notice, but they are none of them material, and I most heartily commend the book to all readers of the American Bee Journal, and to all other bee-keepers.

CLEOME BEE-PLANTS AND MESQUITE.

While coming across the continent on the Santa Fe road, I was much interested in the bee-plants, and especially the ones named above. *Cleome integrifolia* appeared abundantly from Denver all thru Colorado, and later *cleome pungens* was quite as abundant. The bees were working on these plants in good numbers in many places. I pickt blossoms and shook them over paper, when there was quite a shower of nectar drops. It will be remembered that I experimented with this plant in Michigan as one of the most hopeful for bee-pasturage. The result was not at all satisfactory. The difficulty seems to be that when there is not natural bee-forage the season will be such that introduced plants will fail to yield honey. Whatever the reason may be, the experiment was an entire failure. The anthers at the end of the stamens in the *cleome pungens* were green, and the entire flower was very attractive, fully more so, if anything, than *cleome integrifolia*.

I also saw abundant mesquite all thru Arizona. These plants were not near enough to the railroad for me to see whether the bees were working on them or not. I believe that it was past the time of their bloom, tho a few straggling flowers might very likely linger even to August.

Los Angeles Co., Calif.

The Bee's Eyesight or Length of Vision.

BY P. A. SIOLL.

I WOULD like to reply to (not answer) Mr. Geo. H. Stipp's question, or desire (see page 781—1898) to know something about the eyesight of the honey-bee. All that we know about the eyesight or length of vision is about the eye of the human being, our own genus; that is, where we can claim to have some knowledge indubitably, because here our knowledge is not only based on experimental figuring and investigation by micrometric instruments, etc., but we are able to acquire some positiveness—we have the individual himself to explain and answer questions. Wherever we cannot do this the result is, in my opinion, quite problematic and mere guess-work.

Now, take the eyesight of the human being as a rule; what great difference do we find in the eyes of different individuals—hardly two alike; and how far apart is the length of vision from the most far to the most near sighted one? And is there any possibility of doubt that it is just the same all thru the animal world, bees included? So far as my observation reaches I am sure it is so with horses and dogs.

Well, have some entomologist experiment micrometrically with the bee's eyes, trying to find the length of vision of the species; and after making his observations with quite a number of bees, say 100 to 500, he comes to the conclusion that he found what he was searching for, as the majority of his cases were running the same way; but accident happened to furnish him for his experiments nothing but far-sighted bees, or at least the larger amount of them, and what will be the result of his investigation?

Soon another of the same fraternity will come out with an entirely different result, because he had more near-sighted bees to experiment with. Then follows a lengthy dispute between the two scholars and their adherents, but from a general view scientifically there is not much value in all those investigations, as they do not arrive at positive knowledge without all imagination. "Science sometimes makes great mistakes," says Dr. Mason. That's true.

In my younger years, having the sight of one eye only, I could see with distinctness as far as any person was able to do; I could follow the flying bee for at least 100 feet away, and near by the same; the eyesight regulating itself

to suit the distance quite minutely. Now, however, everything is a blur, and the eye is slow on changing distances; 10 to 15 feet is about as far as I am able distinctly to follow a bee flying away.

So, when Mr. Stipp says it is reported that tests of the sight of the condor of the Andes showed he can see at a distance of 100 miles, I would like to know how to prove that; there are no glasses to carry the eyesight of man as far as 100 miles, and with a standpoint on ordinary ground, and with the best instruments, one cannot see further than 30 to 40 miles. That shows that the above assertion is nothing but exaggeration and imagination, and remains with the individual faith whether he may believe or not. But one ought to be slow to take everything for a fact that he sees in print.

To return to the bees: A bee after loading up and taking her homeward flight, certainly is quick as lightning—she beats the carrier-pigeon, but she knows her way, in all probability has traveled it a good many times before; besides she is eager to bring her load home.

Now observe her when she is hunting for nectar in the pasture field. She is in no hurry, making no jumps at all, but easily meandering from one flower to the next, and when there are no more to visit in that immediate neighborhood, she does not move away in a direct bee-line to find more flowers of the same kind, but she scans the ground forward and backward until her sense has discovered the smell of sweets on a new hunting ground. That it is the scent more than anything else which leads the bee on her searches for honey has been shown clearly by Prof. F. Plateau, of Geneva, who experimented with a great number of different honey-yielding flowers, particularly with those of a highly-colored and showy kind, by cutting away their corona leaves or tubes, without injuring those parts which secrete the nectar; and bees, bumble-bees and butter-flies were visiting these flowers and getting the honey out of them after this act of mutilation just as well as before, hardly making any difference with one or two varieties of them, where they circled around just as if they did not know how to attack their crown, tho it was evident that they had the scent of the honey therein. Even flowers that had been hidden entirely by covering them over with leaves or brush enjoyed the visit of those insects just as well. (Bulletins of the Royal Academy of Belge.)

But suppose even that it was possible to ascertain the length of vision of the average bee's eye, it would still leave the question an open one, whether the bee on her swiftest flight could discern the objects she is passing by, and overhead. Who will answer for the little bee? And what good can it be to us if we know? Sonoma Co., Calif.

A Bee, Chicken and Skunk Story.

BY WM. M. WHITNEY.

SOME time ago I promised Editor York to give a bee, chicken and skunk story, and as work in the bee-yard is not crowding, I can give it now; so, here goes.

Allow me to premise by saying, that while the following statement was suggested by the St. Louis chicken story, it is not in the least intended to discredit any of the alleged facts therein, but to give simply my own experience. I will say, however, that we should be very careful in making our observations lest our deductions be erroneous.

On the farm in Ohio we raised the Barred Plymouth Rock fowls; and the pure-blooded males, when about half grown, are quite light-colored; in fact, some of them at a little distance, would be called white. They had a habit of frequenting the bee-yard, but after awhile the bees concluded their room was better than their company, and drove them out of the yard, "for keeps."

Mephitis Americana also made frequent visits to the yard. I discovered him by accident, and sought a hiding-place to watch his operations. He always came—or, that was when I saw him—immediately after a thunder-shower. His movements indicated no fear of the bees, for he was all about the hives, moving in a gentle and quiet manner; neither disturbing the bees, nor being disturbed by them. Hence, the conclusion: *Bees* dislike light colors, but are partial to black. But, hold on a bit. *My bees prefer the society of a skunk to that of the bloodiest cock that struts the yard! Perish the thought!* Let us investigate a little further.

The ground in the bee-yard, while being sward, is very loose and fertile. The chicks found that there were many grubs and angle-worms there, and commenced scratching

for them. Well, do you suppose the bees were willing to have the dirt thrown into their eyes in that way? Not a bit of it; but Mr. Skunk moved about in such a quiet and unassuming manner that he was not in the least molested.

He was there for the same purpose that the chicks were, but he went about his work in an entirely different manner.

It matters not how white the cock is, nor how long his pedigree, he cannot go tearing around among the bees without being told—not in the most polite manner—to please *get out*; while even a skunk, black as the blackest, is permitted to roam about to his heart's content.

Draw your own conclusions. Kankakee Co., Ill.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

ENFORCING ANTI-ADULTERATION LAWS.

No, it's no great occasion for lamentation (or objugation) that the first grocer arrested got off without a sentence. The Lord himself once let off a culprit undisputably guilty of breaking a plain law—and for reasons which some of them apply in this case. *Nobody had ever heard of any attempt to enforce the law, tho' broken daily by a multitude of offenders, some of them high up in the world.* Chicago offenders have now heard of an attempt to enforce. On a new case, committed since the attempt at enforcement, the same justice would not go hunting for an excuse to acquit. When a justice goes on that sort of a hunt there'll quite surely be a squirrel in his bag when he gets home.

SELLING HONEY BY LEAVING SAMPLE.

Glad to hear that Comrade Tyrrell's plan of selling honey by leaving for inspection a sample jar and circulars works in his locality. It may be capable of large imitation. I tested some years ago a plan of leaving circulars only—circulars promising to call with honey on a certain day. No good. Our city people have got beyond reading circulars left with them. But a short circular left with a jar of honey would probably be read in most cases. Page 514.

KEEP HONEY IN A DRY, WARM PLACE.

Does not Mr. Hutchinson make a serious slip in his excellent Country Gentleman article (page 514), when he directs to put a barrel of honey in a cool place? That would be taken to mean the cellar by most readers.

WON'T BE FICKLE ANY MORE ON HIVES.

"Ten-frame hives, which will be my last change." Page 515.

From Daisy to sweet little Minnie
I changed, then to dear Lenore;
From her to several others
Not numbering quite a score,
And now to large-hearted Polly—
BUT I'M NOT GOING TO CHANGE ANY MORE.

How cunningly Miss Minnie Draper-Barnes will smile when she hears this good resolution!

WORKING WITH BEES MORNING AND EVENING.

It seems to me that Mr. Hilton is off the track in intimating that bees never need attention in early morning and at eventide. Far the most precious portions of the day to the bee-keeper, I should say. But the bee-keeping minister don't need to write at eventide—I don't believe. For writing, use all the early morn that ever you choose; but don't burn your intellectual candle at both ends, unless you are sure that it is a very, very long one. Page 515.

EXTRACTING FROM WAX-WASTE.

What W. R. N. thinks well of on page 519 having cloth without perforated metal hold his wax waste in the extractor, and then throwing it away when clogged—has been my practice for a long time now. Still I'm not happy. There seems to be need of side-drainage in addition to bottom-drainage. Perhaps a tilt once in a while, as the bee-keeper goes by, will be needed in addition to the side-channel.

VALUE OF "HORSE-LIGHTNING."

You're too kind to me on page 522. Mr. York. Mr. Brown may try his "horse-lightning" current on me at 6 a.m.—likewise at 8:15 p.m. Increases *value* 175 percent. D'ye hear?

GETTING RID OF ANTS.

The difficulty of destroying ants (Question-Box, page 523) is plainly related to the difficulty of cooking a hare. Locating him may be the worst part of it—and getting hold of him nearly as bad. Moreover, respondents living in the South and far West are decidedly fainter than the others in their shouts of victory—if not inclined to wring their hands in something that looks like agony. Most of us are bothered by ants a little at times, but not quite enough to make us keep our powder dry.

OUT-DOOR FEEDING OF BEES.

On page 525, Mrs. Axtell's out-door feeding seems to be one of the most instructive things in the number. To feed 140 colonies effectively in a box of three-pail capacity is quite a triumph. We think out-door feeding as easy as rolling off a log until we try it—try it a few times, with failure, and then quit. My last failure was owing to the excitement of the bees. More than half of them wouldn't hold still a second—into the honey, and out of it again, in endless succession, till too well plastered and too cold to fly, then on the ground footing it in the sand till they couldn't walk any more. Reckon her success was partly in that frame of lath nailed together, partly hot weather, and most of all in having the bees used to the business.

POINTS ON BEE-HUNTING.

John Piddington's bee-hunting ideas seem good—page 541. Don't be in such a hurry to move off on your line. Catch more bees at the first station. Humor the shy ones by exposing a section outside any box. *Prospect* your lines a good way before making any move of the bait.

YELLOW AND GREEN FLOWERS AS HONEY-YIELDERS.

That "Britisher," page 538, who in effect brands yellow and green flowers poor honey-yielders, would have to readjust his rules for this country. Spanish-needle and golden-rod and Helianthus yield quite a percentage of all American honey. Mustard and rape and white root and dandelion are bee-favorites. The most profuse yielding I ever saw was from yellow flowers (tulip tree). Basswood, our greatest yielder, is a compound of yellow and green—two of the branded colors. Corn and the grasses and grains, which bees visit very much for pollen, nearly all have yellow or yellow-green inflorescence. As for scarlet flowers being never visited by bees, I don't even believe he sees straight for England. Believe I can go to England and see bees just as wildly enthusiastic over scarlet poppies as they are here, and catch just as many bees in the red hollyhocks as he can in the white ones. Hear an impudent Yankee shouting, Mr. Hamlyn-Harris.

THAT UNCAPPING-FORK.

An uncapping-fork, eh? Well, some of us are eminent at working with a knife and fork, and perhaps we need it to complete our outfit. And possibly, indeed, it may be a very valuable addition to work uneven combs. Don't believe it will whisk off smooth combs like a good knife. And most of us will want to "see it go" before taking much stock in it. Page 538.

HERE'S A TO EX-EDITOR HOLTERMANN.

And so we are to lose, and Christian evangelism is to gain, one of our editors—Mr. Holtermann. Should have extended my hand and "God bless him" sooner, only I did not see the item till just now. Page 537.

ARRANGING HIVES IN THE CELLAR.

Mr. Davenport's opening article, page 529, is a worthy one. He is rather unique in placing cellar bees six or seven hives high. Still, as he keeps the lowest ones well up from the ground, and don't let them topple over, what's the odds? And so the out-door colonies in his vicinity last winter perished, every one—fearful cold, and no good flight for nearly five months. Glad I don't live in Minnesota. My observation to some extent agrees with his, that bees (except when from cold they cannot move around) share in true brotherly heroism their last drops of honey, and all perish at once if it comes to that. But (if I'm right) when a *swarm* is shut up in a pit some individuals drop, apparently starving, quite awhile before all are overcome. Wonder if these are not outsiders that joined the swarm

while it was in the air. Otherwise, perchance ill ventilation, or worry, or old age, may be the true solution.

A BLIND BEE-KEEPER'S WAY OF FINDING A QUEEN.

That blind bee-keeper's method of finding the queen coax nearly all the bees away from her with a comb of syrup—may prove worth using by folks not blind, in a few desperate cases of a small and shy black queen, got up in imitation of a squirrel. But a freshly-uncapt comb of new honey from some other hive would draw better than a comb of syrup I think. Of course, the thing would have to be managed so gently that the bees not yet drawn would not fill themselves with their own honey. Page 530.

A "PAT" FOR A BOY SWARM-HIVER.

If J. F. Sautter was a boy in 1897 he can hardly be a Methuselah now. Here's a pat for his back. His method of taking and hiving that swarm—well, the oldest of us couldn't have told him a better one. Page 530.

SELLING EXTRACTED HONEY EARLY.

Sell extracted honey before the many needs of the winter have taxt the buyer's pocket-book. Right you were that time, Mr. Burrell. Page 531.

ANOTHER HINT FOR "MRS. PENNSYLVANIA."

Dr. Miller, that was a good hint of yours to Mrs. Pennsylvania. For another hint (seeing she still longs for the first good super of honey) let her ask that despised vixen of a queen to tell her children to put it up next season. The chances are that if left alone they are far the best honey-storers in the yard—providing they happen not to swarm. Page 535.

Report of the Central Texas Bee-Keepers' Convention, Held at Milano, July 20-21, 1899.

BY LOUIS SCHOLL, SEC.

The annual convention of the Central Texas Bee-Keepers' Association was held at Milano, Tex., July 20 and 21, 1899. It was called to order by Pres. Aten at 10 a.m., July 10, and Judge J. B. Newton gave the bee-keepers a cordial welcome in behalf of the citizens of Milano, to which Mr. F. L. Aten responded.

There being some time before dinner, the first question in the question-box was taken up.

DO QUEENS LAY IN QUEEN-CELLS?

"Is it a fact that queens lay in queen-cells already started, or do the bees move the eggs?"

Judge Terral said that queens did not lay in queen-cells.

H. H. Hyde had seen evidence that queens did lay in queen-cells, seeing nothing but eggs at times, also cells started and no eggs in them; later eggs were found in them.

G. F. Davidson confirmed Mr. Hyde's views.

F. L. Aten differed from Judge Terral, confirming the views of Messrs. Hyde and Davidson.

E. J. Atchley's experience is that the queen lays the eggs; bees do not move eggs, neither do bees start cells over eggs.

L. Scholl said bees do not start cells over eggs. He tried this when rearing queens. Bees first wait till the egg hatches into a larva, and then construct a cell over it.

A vote was called for on the above question, and the affirmative carried by vote of 4 to 1, the majority in attendance not voting.

"Can a fertile queen be introduced without a cage to a colony with a fertile or unfertile queen, and remain for several days?"

Mr. Hyde recited a case where such was done, and Mr. Atchley confirmed him.

The convention then adjourned till 2 o'clock p.m.

FIRST DAY—AFTERNOON SESSION.

The election of officers for the ensuing year was first taken up, and resulted as follows: E. R. Jones, President;

J. B. Salyer, Vice-President; and Louis Scholl, Secretary and Treasurer. The next meeting will be held at Hutto, Williamson Co., Tex., the first Thursday and Friday before the full moon in July, 1900.

THE HONEY-RESOURCES OF TEXAS.

Mr. Atchley gave a good talk on this subject. He said that north Texas was once a good bee-country, but horse-mint is cut off now, and cotton is the main honey-plant. All Texas is a good bee-country, but the south of Texas is the best in the world. He also said that bee-keeping was undeveloped in the South; that large amounts of honey were going to waste, and that the people had to be educated and taught how to keep bees in better ways. Big bee-keepers of experience could do a lot of good by going around and teaching the people how to keep bees, advise them to keep bees as it is more profitable than other pursuits, there being more money in bee-keeping than in raising cotton. It should be the united efforts of all to push it and teach the producer how to produce honey, by reading bee-literature. The question once was, how to sell a crop of honey, but it is different now. It is how to produce a crop, as the demand for it is always there. Not long ago the demand for honey was very small, but now it has increased from 10 to 15 times as much. He said that he could have sold about 30 carloads this year, as the demand is so great, but was unable to furnish it.

Mr. Davidson said that a discussion on the honey-flora of Texas was not really necessary here, but gave his experience, as he had traveled a good deal over eastern parts of the State, and found bee-keeping in the most undeveloped condition, and the bee-keepers uneducated. He also found fine ranges of basswood in east Texas, but no practical bee-keepers, and honey had to go to waste. The demand for honey with him was so great that he could not supply it.

THE BEST SECTION-HONEY SUPER.

This subject was then handled by O. P. Hyde. He exhibited a section super generally known as the "Ideal." The super was of the dimensions of the standard 10-frame hives, 5 1/4 inches deep. In it were seven plain slats 1 1/2 inches wide, and 3/8 inch thick; on each rested five tall, plain sections, filling up the full inside length of the super. In this he uses the Hyde-Scholl No. 2 separators, which he then described, first telling how he liked the fence separator so well when it first came out, as he knew it was good. But he said that his son, and also Louis Scholl, were not very well satisfied with the fence, and so they made a new separator with slats lengthwise like the fence, but instead of cleats across the separator they made an upright slat with little cleats on the edge of the separator where the sections come in contact. This gave freer communication than the fence; bees could go from section to section straight thru and diagonally across in every direction. On account of the upright slat there is more free communication, and, besides, it caused bees to fill sections solid to the wood. He found it the best separator out, and closed by stating that Mr. Root objected to the Hyde-Scholl separators at first, but wrote several favorable letters lately.

Pres. Jones arose to criticize the above. He liked the super; thought that slatted separators that give free communication straight thru from one row of sections to the other row did not cause better filled sections; believed it was caused by something else, and would like to find out. He thinks full sheets of foundation to come within 1/8 inch of the section would be best. He prefers a free-communication separator, and said that there was nothing nicer than a solid section of honey with the comb sealed all over solid to all sides of the section, and the cappings of the outside row of cells all around a fraction beyond the surface of the comb. This is greatly in favor of the Hyde-Scholl separator, as the upright slot allowed the bees to extend the cappings around the outside edge of the comb just a fraction, which gives it the finest appearance. Mr. Jones said the Hyde-Scholl separator allowed the bees to pass all around the edges of the sections, which is the cause of the better filling. The only objection he mentioned was that the wood-separators were hard to clean of bee-glue. Otherwise he endorses the use of this separator, and suggested improvements on it if necessary.

O. P. Hyde said that he was glad Mr. Jones tried to criticize, and thank him for making a better speech than he himself. He told Pres. Jones that if he objected to the Hyde-Scholl wood-separator he should use the H.-S. tin ones, and he would not have trouble with bee-glue.

Pres. Jones did not mean the H.-S. wood-separators only, as all wood-separators are hard to clean of bee-glue.

He likes the tin ones, and prefers their use if there is no difference or objection to use tin in supers.

Mr. Atchley spoke most favorably on the H.-S. separators as the best before the bee-keeping world now, and thinks it will be years before any improvement can be made on them. He advises beginners to start with it, and that also everybody use some, and give the young inventors fullest recognition. He also thought one-third more honey could be obtained by their use.

PRODUCING COMB AND EXTRACTED HONEY.

The production of comb and extracted honey in the same hive, to take advantage of short and fast flows, was discussed by H. H. Hyde. He said he had a method with which some, perhaps, were already familiar. For illustration, 50 colonies are put into winter quarters the fall before with plenty of honey in the hive-bodies. During the main honey-flow 30 are run for comb honey, 20 for extracted. See that all have prolific queens, plenty of room and honey, and no queen-excluders. Just before the fast flow he puts the most capt brood in the lower story, takes the upper story to hives run for extracted honey, replacing these with comb-honey supers on the 30 colonies. He prevents swarming by cutting out cells. After the flow he takes off the section supers and replaces with the extracting-supers.

Louis Scholl read a well prepared article on "The Hive I Use," which was requested to be inserted in regular order in this report. It is as follows:

The Hive I Use.

I will first give a description and the measurements of the hive I use, and then the reasons why such a hive was adopted.

For several reasons I prefer the Danzenbaker bottom-board and cover. These are of the 10-frame size. The hive itself is composed of a series of shallow cases, the same as the standard 5 $\frac{1}{4}$ -inch 10-frame supers. These cases are 16x20 inches outside, and only 5 $\frac{1}{4}$ inches deep, without tin-rabbits. Each case holds 10 shallow frames, standard Langstroth size, but only 5 $\frac{3}{8}$ inches deep, and of the Hoffman self-spacing style. These shallow cases are used as brood-chambers as well as for supers when producing extracted honey. The section supers for comb honey are of the same size and depth, and take the tall sections, plain slats, and free-communication separators, generally known as the "Ideal" super arrangement. Two of these shallow-frame supers are used over a brood-chamber, which makes it a depth of 11 $\frac{1}{2}$ inches.

Twenty frames in both cases have a comb surface nearly equal to 12 Langstroth frames. This provides a large brood-nest, and from experience I find it not too large, not for my locality, at least. My reasons for preferring this hive and shallow frames are as follows: When producing surplus honey in supers above the brood-frames, especially when producing comb honey in section supers, I have had trouble with the bees filling the deep Langstroth frames with the honey that ought to go into the sections during a slow flow, especially along the top edge of the comb above the brood; and after this honey is once sealed, bees are quite loath to store surplus honey above such sealed stores, causing them to loaf and hang all over the hive. Besides, the queen was also crowded out, as the bees filled the cells with honey from which the young bees had just hatched.

Now my question was, how to get that honey out of those frames into the sections above. This, of course, could be done by inverting the brood-chamber, frames and all, but it caused both trouble and labor. Besides, I am not a reversible-frame advocate. It can be accomplished to a great extent, tho, by using a divisible brood-chamber hive, by reversing or exchanging the upper case with the lower one, which puts the honey in the center of the brood-nest, where it is then removed by the bees and carried up above the brood into the section super. By removing this honey the bees also provide more breeding-room for their queen. I think these are some good advantages we have over hives with very deep frames, such as the Dadant-Quinby, and also those Draper "barns," so much spoken of in certain bee-papers.

The "barns" are of the same depth and measurements as my hive, and I cannot see why they compare them to barns, as I do not find them so. Their advocates claim larger colonies of bees and better results for their large combs; object to a division thru the center of the brood-nest, and prefer to have their bees brooding queen's-eggs, larva and pupa-bees instead of sticks and empty space.

But why, and for what reasons does Mr. Danzenbaker

have his combs built out solid all around to the frame, and then "gouge" a big hole right thru such combs with a butcher-knife, to provide a passage-way for the bees?

Now I like an opening or passage-way for the bees to go thru, from one comb to another, but I surely prefer those long ones, lined with wooden sticks, to those ugly holes right thru the combs.

Well, as I am a shallow-frame advocate, anyway, and after studying the many advantages which they possess over the deep Langstroth, I was tempted to try some hives with shallow frames of the same depth all thru the hive. I have used, and am still using, supers with shallow frames on all of my Langstroth-frame hives, and there is where I learned of their advantages, especially when running for extracted honey.

As this hive is mostly handled in sections or stories, the full supers are easily removed, by smoking the bees thoroly when raising the cover, forcing them down and out of the full super, when it is then taken off, practically free from bees, and there is not much brushing to be done. Then, too, they are more convenient to handle, as they are not so heavy as the full-depth supers.

The shallow frames are easier to uncap, as one draw of the knife uncaps one whole side of the comb, while it takes longer to uncap the deeper frames; besides, they are awkward to handle, and more danger of combs breaking out.

Besides, I prefer shallow frames for dividing, uniting, transferring, queen-rearing, and most other things in the apiary. There is not much use of handling the frames individually, except in a few instances when looking for the queen or cells, or when looking for larva for queen-rearing, and the like. Otherwise the hive is handled by sections, and all that is necessary when examining colonies in early spring, or looking for queen-cells later on, or when examining for honey during the honey season, and such like things, is to tilt the upper case back, and one can get a full view of the brood-nest. If there are queen-cells present, they will generally be found on the bottom edges of the upper frames.

Then, too, if the queen needs more room during the breeding season, one of the shallow cases is added, without the bad result of too much room, as is mostly the case when giving full-depth stories. The same is true when giving weaker colonies more room for honey.

Besides the section supers being of the same depth and size, all are interchangeable, and we are not bothered with hive-bodies and supers of different depths.

The section super for comb honey that I use in connection with this hive, is that known as the "Ideal." It takes 35 one-pound plain sections 3 $\frac{3}{4}$ x5x1 $\frac{1}{2}$ inches, which are supported on plain slats, five sections in a row on each slat, taking up the full inside length of the super.

The Hyde-Scholl No. 2 separators are used between the rows of sections and also one each outside next to the wall of the super, when all is wedged up tight by a follower-board and super-springs in the super. This arrangement I prefer, mainly for the free communication offered thruout the whole super. It is the same as the Ideal super just previously described by O. P. Hyde.

My method of manipulation for honey corresponds nearly with the methods applied by H. H. Hyde, and just described by him, or what is known as the Barber plan of producing both comb and extracted honey on the same hive at one and the same time, which plan I myself also conceived several years ago.

I am well aware that there are many who prefer the standard Langstroth frame, but it will be understood that as I produce both comb and extracted honey on the same hive, and at the same time, accounts for my preference for all interchangeable supers.

Some may think that I have made a radical change, while I think I have not, as all these are standard 10-frame shallow supers, and could be used on regular 10-frame hives if found unsatisfactory, which they have not done.

LOUIS SCHOLL.

Mr. Davidson said Mr. Scholl's hive and management for comb and extracted honey is all right, and did not find it necessary to criticise.

Mr. Aday asked Mr. Davidson how he manages to produce comb honey without the use of separators, as he has had bees build their combs crosswise in all six sections when used without separators.

Mr. Davidson answered that he did not use separators and produces fine honey. He is very careful in putting foundation starters in the sections correctly and straight, and exactly in the center. Then he puts the supers on

strong colonies that can fully occupy the whole super at once, and during a big, fast honey-flow.

Pres. Jones says that locality has a great deal to do with it. Then there is a difference in colonies of bees to produce straight combs. During slow flows separators are absolutely necessary, and they are always advantageous in producing straight combs.

Mr. Atchley advises the use of separators, as much honey is ruined by not using them. Beginners need them, and with them separators are necessary. Then he prefers to run colonies for extracted honey if not strong enough to fill the super with bees, and not strong enough to produce comb honey in sections.

The convention then adjourned for supper.

(Continued next week.)

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Preparing Bees for Cellar Wintering.

I have been in the habit in the autumn of putting on top of my colonies a section-case in which I put a burlap cushion filled with chaff, a Hill's device underneath the cushion. My colonies are put into the cellar in November in this form. Our house is used only in the summer, and has no fire in it throught the winter, which is long and severe. The bees are carried out from the cellar about April 20. I have had trouble from moldy combs and hives, cushions, etc., gathering dampness. Would you advise me to continue the use of the cushions, or will there be less dampness in the hives without them? I have thought of filling some of the cushions with mineral-wool, and of putting a quantity of muslact lime in the cellar, altho the cellar itself is a dry one. The dampness comes from the bees themselves, and a low temperature.

I winter the bees without a bottom board, and cover them with a cage of wire-netting to keep mice out. Any criticism of this method will be gladly received.

NEW HAMPSHIRE.

ANSWER.—I doubt my ability to suggest anything better. The cushions can hardly do any harm, and may do good. The lime and mineral-wool plan is at least worth trying. The main trouble seems to be the coldness of the cellar, and you rather imply that no one is present in winter to keep it warmer. Couldn't you make the cellar warmer by sufficient banking? If the house is unoccupied thru the winter, two or three feet of straw or hay on the floor overhead would make the cellar warmer, but such a suggestion would throw a tidy house-keeper into convulsions. An extra quantity of paper—even several thicknesses of newspapers—would answer much the same purpose. The paper could be under or over the carpet.

What Ailed the Queens?

On page 567, "Mich." asks, "What do you think is the trouble?" referring to a queen that would lay drone-eggs. In reply you do not tell him; you say, "It is to be feared the queens are at fault." Now, we know that, Doctor, without writing to you, but how is the faulty queen produced? and what do those queen-breeders do, or not do, to have such?

Last winter was the worst one I ever went thru. In the spring I had lots of dead bees, and so great numbers of empty combs that I protected from the moth by placing them under strong colonies. That gave the colony unbounded room, and I had no swarms, so I sent to a queen-breeder for 15, and after much delay I got them. I introduced them all right; a few went to laying all right, but

seemed afraid of the bees, getting on the outside frame and the most of them were not right. One never layed an egg, finally she was not there, and I gave them a frame with eggs from another colony. Some of the others laid drone-eggs, or worker-eggs in worker-comb, anyway; and one all drone-eggs—that one I killed.

Now, I am sure there was something that was not right with that breeder, and he can never sell me another queen, for he is either a man without principle, or he does not know his business. So when I saw the question, "What do you think is the trouble?" and you did not explain, I thought perhaps he is not up to the trick of the trade, but no doubt can find out. So will you please give us the particulars? It is some way connected, I think, with rearing large numbers of queens in an upper story, and not having them strong.

ILLINOIS.

ANSWER.—Referring to the first question on page 567, if you know that the trouble is with the queen, you know more than I do. It is entirely within the range of possibilities that there may be no queen at all in the case, but laying workers. The only thing to militate against such view is the implied statement that some of the sealed brood is worker-brood. But definite length of time is not given, and it is just possible that the sealed worker-brood may be the work of a previous queen, or it may possibly have been given from another colony.

But the probability is that the trouble was with the queen, and coming to the gist of your question I must frankly say that I don't know what the breeder did, or did not, that made the trouble. Indeed, I don't know enough to know whether the breeder was at all at fault. At the same time it must be confest that in the large number who pose as queen-breeders the probability is that a good many, or at least some of them, don't know their business very well, and it is even possible that, as in all other lines of business, there may be one or more that may be properly clast among the unscrupulous. But the most skillful and the most conscientious breeder may send out a queen that he has found to lay all right, and when the purchaser gets it, it may perform as did the one mentioned.

Without knowing all about the matter, I may mention two points in the case. There seems to be a change sometimes made by a journey in the mails. A queen that lays all right in the hands of the breeder, is in some way so changed by her travels that she lays irregularly or scarcely at all for the purchaser, sometimes recovering in a short time, and sometimes not. I once paid a round price for a queen imported from Italy, and when she got among my bees she wouldn't lay an egg in the orthodox way, but persisted in sticking them on the sides of the cells. Fortunately she changed her behavior in a few days, and did excellent work.

As to the other point, a queen is sometimes so maltreated by the bees in a strange colony as to be unfit to do the work she did before. That may be the case when she has not been jolted thru the mails, but is likely to be aggravated in the latter case.

It would take more space than can be here afforded to tell all that must be done, and all that must not be done, to rear good queens. But I'm not sure that you are making a straight guess when you lay the trouble to rearing large numbers of queens in upper stories. No better queens in the world can be reared than can be reared in the upper story of a strong colony with a laying queen below. But you make a center shot when you add, "and not having them strong." To have the royal larvae fed in anything but a strong colony is neither necessary nor wise. It is possible that they are correct who say that a good nucleus will rear as good queens as a strong colony—at least it is possible that they are right under some circumstances—but it costs only such a trifle more to have the work done by a strong colony, that a breeder is hardly bright, no matter how dishonest he is, if he does not have his queens reared in a strong colony.

If any one else knows in what way a breeder might be at fault in the case, aside from the ordinary rules for rearing good queens, the floor is yielded.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

GEORGE W. YORK, Editor.

ONE DOLLAR A YEAR.

SAMPLE COPY FREE.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. SEPTEMBER 28, 1899. NO. 39.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Philadelphia Convention Report is delayed a week on account of copy not arriving in time to continue it in this number. We hope that beginning with next week we may be able to publish it without further break.

Honey Imported into Germany. The Munchener Bienen-Zeitung reports that in 1896 there was brought into the seaport of Antwerp 1,444,866 pounds of honey; in 1897, 1,562,678 pounds. Of the latter amount United States sent 346,506 pounds.

"Honey Not Advancing, and Why," is the heading of an editorial item in Gleanings in Bee-Culture. Editor Root says prices are not going up as they ought, because commission-houses and honey-buyers are offering little if any better prices than were offered for the big crop of 1897. He says:

As I pointed out in our last issue, when prices are moving upward on everything else there should be a corresponding rise on honey; and if our commission-men can give us a little substantial support we may look for improvement in general prices. In the meantime, bee-keepers should send only to reliable firms. It is the irresponsible cheap Johns, inexperienced, unknown concerns, that move off the honey at any price for the sake of making it move quick.

In all of which he is correct; but it is not so clear that he is correct when he says: "But one, two, or three houses can't advance unless all do." A careful observation of quotations thruout the year hardly warrants the belief that there is a general concert of action among commission-men,

and the fact that one house sometimes *does* advance or lower the price without any corresponding change on the part of others is pretty strong proof that it *can* do it. There seems to be little question that the honey crop of 1899 is unusually short, and there is no reason to satisfy one in believing that there should not be a material advance in price. Indeed, in some quarters, at least, there is already an advance, but there should be a forward movement all along the line.

Bees, Birds and Grapes is an editorial heading in a recent issue of Gleanings in Bee-Culture. Mr. Root remarks thus upon the subject:

Nearly every year about this time the bee-keepers are met with complaints from their neighbors about how the bees are eating their grapes. It has been pretty well established that bees never touch the sound fruit; and until within a year or so it was supposed by all fruit-growers, and even by some bee-keepers, that bees made a small round puncture thru the skin of some soft grapes like the Niagara, and even pierced the more hardy Concords. But two years ago we were successful in finding the real culprit, and that was in the form of a little bird, quick of flight, scarcely if ever to be seen around the vines when any human being was present. This bird, about the size of a sparrow, striped, and called the Cape May warbler (*Dendroica tigrina*), has a long, sharp, needle-like beak. It will alight on a bunch, and about as fast as one can count the grapes will puncture berry after berry. After his birdship has done his mischief he leaves, and then come on innocent bees to finish the work of destruction by sucking the juices of the pulp of the berry, finally leaving it dry and withered up. While the birds are scarcely ever "caught in the act," the bees, ever present during all the hours of daylight, receive all the credit for the mischief.

Grapes broken in handling will be visited by bees independently of any tampering on the part of the feathered tribe; and at such times bees do very often prove to be quite a nuisance; but it may be said, on the other hand, that broken grapes are unsalable anyhow, and therefore this damage is slight if any, and the real mischief or harm done is simply the annoyance caused by the fear of being stung while handling over the bunches in the basket.

On another page will be found an excellent article on this very subject, by Mr. C. P. Dadant. We often wonder if the time will ever come when fruit-growers will cease unjustly accusing the bees of puncturing grapes. But it takes a long time to educate many people when so widely scattered, and also when so disinclined to accept the truth when placed before them. Too many good people are willing to form their opinions simply from the *appearance* of things, not taking the time to investigate carefully and then decide from the facts.

We expect soon to publish some more of the same kind of conclusive evidence that Mr. Dadant gives. It might be a good thing to let your fruit and grape growing neighbors read all that appears in these columns on this subject.

Removing Honey with the Bee-Escape. In the Progressive Bee-Keeper, G. M. Doolittle gives the following very clear directions for using the bee-escape method of removing honey from the hive, without lifting the supers entirely off:

Many bee-keepers seem to think it necessary to lift the supers entirely from the hive in using bee-escape boards, for ridding the sections of bees. But such a course is very laborious, as well as unnecessary, as there is a much easier way, as well as quicker.

Go to the rear of the hive, having the escape-board, a lighted smoker, a wedge about 8 inches long and 1½ inches thick at the heavy end, and a stout, heavy knife or chisel, the latter being preferable. The chisel I use is what is called a "firmer" chisel, and is one inch wide.

Now with the chisel pry the rear end of the super up a little from the hive, just enough so you can enter the sharp end of the wedge, but not enough so any bee can come out. This gives a crack; open enough so you can send in a

little smoke from the nozzle of your smoker, just enough to drive the bees from the crack you have made.

Next, pry a little harder with the chisel and slip in the wedge till a crack half an inch wide is made. If the frames are of the hanging, loose kind, it is barely possible that some of them may lift up with the super from being glued to it, or from bur-combs. If this happens, you can now catch the chisel between the ends of the frames and the super, and by a little pry cause them to go back on the rabbets where they belong; and if you used a little more smoke just before you did this, no bees will be caught between the end of the frames and the rabbet.

Next, lift a little on the super with one hand and push the wedge up with the other till a crack about an inch wide is made, when you will blow plenty of smoke over the tops of the frames and under the supers, this causing nearly all of the bees to run below or up into the super. Now take hold of the super with one hand, lifting the back end of it till it is at an angle of 45 degrees, when the heavy end of the wedge will cause it to fall to the ground, so you do not need to touch that any more for this operation.

Now pick up the escape-board with the hand at liberty, and put it as far under the super as it will go, immediately lowering the super upon it. Now pick up the chisel and catch the point under the super, when with a little pry, and a pull with the other hand, it is slipped square on the escape-board. Then quickly go to the front end and catch the point of the chisel under the escape-board, and with a little pry and pull, the escape-board and its load are over the hive in the right position, and you have done the whole thing with very little physical exertion, at least not enough but what the weakest of men or an ordinary woman could do easily. The telling of it takes up considerable room on paper, and makes it appear like quite a job, but if any one will practice it on a few hives till he becomes somewhat familiar with it, he will never go back to the old, slow, laborious way of lifting the super off on something, putting on the escape-board and then lifting it back again.

Rosy-Hued Reports of Honey Crops do not receive the entire approval of *Sonnambulist* in the *Progressive Bee-Keeper*. In his own inimitable way he inveighs against "the wholesale inflation of honey crop reports." One man has a remarkable yield, and that is heralded to China and intermediate places, the bee-papers, as if short of copy, zealously printing and reprinting the story. Then the ambitious supply-dealer parades publicly the great amount of lumber used, hands employed, etc. When the bee-keeper suggests an advance in prices the commission-man confronts him with these rosy reports, and he is dumb. No direct remedy is offered, but a side-thrust given at the inertia of bee-keepers. Please, dear *Sonnambulist*, tell us distinctly just what ought to be done.

REV. E. T. ABBOTT, of Missouri, called at our office on his way home from the Philadelphia convention, last Friday. He took several side trips on both pleasure and business, after the convention closed.

MR. WM. M. WHITNEY, of Kankakee Co., Ill., made an apiarian exhibit at the county fair held this month. He received first premiums on both comb and extracted honey. A picture showing himself holding a frame loaded with bees seemed to capture the crowd.

THE CONVENTION PHOTOGRAPH, at Philadelphia, was taken by Mr. W. Z. Hutchinson, of Flint, Mich. It is a very good one, and Mr. H. will mail a copy of it to any one sending him 50 cents. The picture shows about 60 of those that were present at the convention, standing in front of the Franklin Institute building.

MR. L. KREUTZINGER, of this (Cook) county, held his annual "honey harvest," as he calls it, Aug. 19. A number of visitors gathered at the main apiary to enjoy watching taking off the sweets from some 200 colonies of bees, and witnessing the manipulation of hives, bees, wax, and honey extracting and packing, and the work of the honey-bee. The event occurs but once a year, to which Mr. Kreutzinger sent about 400 neatly printed invitations with complimentary tickets of admission to his friends and acquaintances, to which nearly every one responded.

Underneath the rows of shade trees, on benches, the guests, men, women and children, looked from a safe point at the hives being robbed of their sweets, and at the same time sampling the honey offered them in the most liberal quantities, in conformity with a notice posted in the beeyard, which read thus:

"Visitors are cheerfully invited to partake of as much honey as they desire; those, however, not accustomed to eating honey in large quantities, should partake moderately at first. Every visitor will be served at the table of sweetness from 4 to 7 o'clock, p.m."

About 50 veils were prepared for the occasion for those desiring to look into the hives while supers were being taken off, but many of the visitors had to be without them. Mr. K. exhibited the wonders of the hive to a number of bee-keepers and men of professional experience in the city, and also bee-supplies, some of which he received from Germany a few weeks previous to this honey harvesting event, among them being a papier-mache queen-excluding board; a swarm-bag with self-closer to hive swarms from high trees—a very handy device; queen-nursery, German horse-hair veils, Rietsche uncapping-fork (or comb-rake), isolation-oil for foundation press for deep-cell presses, and other devices of interest.

The hives of bees under the glass in the observatory building, a golden Italian queen-bee in the original mailing-cage, setting up sections and putting in foundation starters, were the principal objects of interest to the visitors.

Nearly all of Chicago's leading newspapers made mention of the event, the *Evening Post* describing the event as a novelty in this industrial world. It also referred to the history of the honey-bee, the principal objects in view at the apiary, particularly the two-story bee-house containing honey, the packing and fumigating rooms, the upper floor for storage, with the cupola as an observatory. The article closed with this paragraph:

"I ask the master of the apiary how he happened to engage in bee-keeping. He said that in Germany it was the custom, in fact an unwritten law, that country school-masters should in addition to the profession of teaching follow the business of forestry, horticulture, or bee-keeping. His father was a teacher and keeper of bees, and the son naturally loves this occupation. He owns three apiaries, the one visited yielding four tons of comb honey, gathered from the wild flowers of the prairies. The subject of bees and bee-keeping is inexhaustible, and I know of no occupation better calculated to develop and foster the Christian virtues of temperance, patience and industry."

We had the pleasure of calling at the apiary towards evening, just after the crowd had departed. Everything indicated a very sweet time. Mr. Kreutzinger sells much honey in this way, the visitors carrying it home with them in cases holding 12 sections. He also receives many orders by mail soon after his annual honey harvest, from those who were present. It is quite a scheme to get a lot of advertising, tho we don't think we would care to recommend it on so large a scale. Generally, to have a crowd around when removing honey is more of a nuisance than anything else. But, as the colored brother said, "Differrent men hab differrent ways."

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

◆◆◆
The Premiums offered on page 621 are well worth working for. Look at them.

The Alfalfa Injured.—W. J. Fulton says that in his part of Kansas there has been too much rain for the alfalfa, a yellow butterfly monopolizes the nectar, and a web-worm webs the buds and bloom into a knot. So the bees have done no good since the first of July, and if the third bloom is no better than the second the honey crop will be almost a failure.—Progressive Bee-Keeper.

How to Wax Rubber Rings.—Dr. Miller said in a Stray Straw that C. Davenport's plan of waxing rubber rings to prevent the leaking of self-sealing cans didn't work in his "locality"—the wax flaked off the rings. Mr. Davenport says in Gleanings in Bee-Culture that the trouble was in having the wax too cold. The wax must be boiling, and the rings just dipped in and instantly withdrawn.

The Best Size of Hive, according to S. P. Culley in the Progressive Bee-Keeper, depends upon three things: Your locality, the sort of man you are, and what you want to do. For a locality subject to drouth no hive will be satisfactory; an 8-frame hive is best where fruit-bloom is plentiful with a fair flow of clover and a fair fall flow; a 10-frame for two very strong flows each season; and a 12-frame for a strong flow from March till October.

A Winter Flow of Honey would seem at first blush, to those whose bees are imprisoned 4 or 5 months, to be a very nice thing. But replies in the Australian Bee Bulletin seem in general to think otherwise, and G. R. Harrison says:

"After five years' experience of a country where they often have winter flows, I envy those people who are located where they have a decent winter so that they can shut down the hives and forget all about the apiary for from 4 to 6 months."

Bees and Public Schools.—The Progressive Bee-Keeper copies from the American Bee Journal Anna Sundberg's synopsis of our talk about bees in the public school, expresses the hope that we may find time to address more schools, and asks:

"Would it not be a good idea for all of us to follow Bro. York's plan, and see if we cannot have at least one lecture a year on bees, delivered to the children of our public schools?"

"Extra Fancy" Honey.—A nameless writer in Gleanings in Bee-Culture sounds a note of alarm. "Extra fancy" honey has been quoted by a commission man, and it is feared that such quotation will only have the effect of bringing down the general price, the extra fancy taking the place of what was before highest, the price of lower grades falling. Is there any such danger, especially as the quoting of extra fancy was accompanied by a rise in price of the same? The argument is used that not one bee-keeper in 500 will have any extra fancy, and yet why is that one in 500 not entitled to reward for the superiority of his honey?"

The Time Between the Prime and Second Swarm is given by Doolittle as nine days. Critic Taylor, in the Bee-Keepers' Review, thinks that doesn't apply to his locality. He kept track of 10 cases, in which one second swarm issued in 5 days; 2 in 7 days; 2 in 8 days; 4 in 9 days; 1 in 10 days. That makes an average of a little more than 8 days; so there is not so very much difference between them. Possibly Mr. Taylor had in mind that the length of time was not the same in all cases, and that view is hardly held by Mr. Doolittle. It might also be added that in some cases the time is considerably more than 10 days.

Western Manipulation is the title of an article in the Progressive Bee-Keeper by F. L. Thompson. That sounds a little novel, for it is perhaps too much the case that instruction for management is given as tho all places were alike. "With two flows," says Mr. Thompson, "the first beginning June 10 to 15, and the last ending somewhere about Aug. 20, with a not entirely barren interval of two or three weeks between them, this being the condition of thousands

of apiaries all over the West proper, it seems high time that we had something else written about management than is applicable to white clover and basswood flows, and that the unqualified talk about 'useless consumers' should be given a rest." Western colonies should continue breeding heavily for some time after June 10, so as to be ready for that August flow. An additional reason for continually large colonies is that the cool nights make the weaker colonies desert the outer parts of the supers, working only in the centers. The habit of Italians, filling up the brood-nest early, Mr. T. thinks a serious fault for the West, and he seems to have a leaning toward Palestines, Carniolans, or Carniolan-Italian hybrids.

How Many Bees for Wintering? To the question as to how many pounds of bees should be put in a nucleus-box in order to make a full colony to winter over, Mr. Doolittle replies in Gleanings in Bee-Culture somewhat after the following fashion: About 5,000 bees make a pound when the bees are not filled with honey; about 2,500 when the bees are filled. Three weeks before swarming, 20,000 bees make a strong colony, and 40,000 to 50,000 a strong colony for working in sections to the best advantage. A colony good enough to winter successfully must have 12,000 to 15,000 bees, and these, when well filled with honey, will weigh 5 or 6 pounds.

Thick or Thin Winter-Packing.—Most of the Wisconsin bee-keepers cellar their bees, but occasionally one in the southern part or near the lake packs out-doors. R. H. Schmidt wintered 45 colonies thus in the last severe winter with no loss, and attributes his success to the *thinness* of the packing and packing-box. The outside case is made of strips only $\frac{1}{8}$ -inch in thickness, and the packing is three inches. On the other hand, O. O. Poppleton places great stress upon *thick* packing. Mr. Schmidt says the thin packing allows the bees to warm up enough for a flight on warm days; but T. F. Bingham says bees with thick packing "don't have to" fly.—Bee-Keepers' Review.

Advantage of Clipping to the Breeder.—When a customer receives from H. L. Jones an unsatisfactory queen, he replaces it and asks the return of the faulty one. On several occasions he has had returned queens with perfect wings, when the queens he sent out were clipped, the customers not having noticed the difference. The editor of Gleanings in Bee-Culture commends the plan of having queens clipped before being sent out by the breeder. He says that every year they have been obliged to replace queens that he felt morally certain were all right, but probably destroyed by the bees, their places being taken by inferior queens already in the hives. Clipping would be a check on that sort of thing.

Fastening Foundation in the Top-Bar.—Editor Tipper says in the Australian Bee-Bulletin:

"While in Sydney we saw frames with slits on the underside of the top-bar, sufficiently large to place the edge of the foundation in, and a slip of wood $\frac{1}{4}$ -inch square and the length of the underside of the bar, to wedge the same in. It seemed very convenient and trouble-saving."

Doubtless you would think much more convenient the plan in use in this country, Mr. Tipper. Make a saw-kerf wide enough to receive the foundation, then very close beside it another kerf to receive a strip of wood perhaps 1-16 or $\frac{1}{8}$ -inch in thickness. You will see that in this case the wedging strip does not touch the foundation at all, and is very easily crowded into place.

Selling Honey by the Section. In Gleanings in Bee-Culture, "American Tramp" says:

Bee-keepers are very foolish to sell their comb honey by the pound. The proper way is to sell it like the retailers, by the section. While in Florida I sold all my comb honey by the section, direct to the retailers. When I first started in, here is about the way I was met by the grocers:

"That's very nice honey; how much do you ask for it?"

"I want 12½ cents each."

"Well, but they don't weigh a pound."

"I did not say they did."

"But honey-sections are supposed to weigh a pound."

"Do you sell them by the pound?"

That generally settled it. There was no more said. My sections were $4\frac{1}{4} \times 4\frac{1}{4}$, seven to the foot, and weighed about 13 ounces each. They sold right along side by side at the same price with the six-to-the-foot sections.

Bee=Culture

1899 EDITION.

The Only Cyclopaedia on Bees—
475 Pages.

1,000 Already Sold.

The demand for this work has become so great that the preceding edition, consisting of 10,000 copies, was exhausted some months before the new one could be gotten out; and in the 6 months intervening, something like 1,000 copies of the new work have been sold, and that even before it was out of the press. This, the latest edition, reaches the 67,000 mark, and is in many respects very much superior to any previous edition, in typographical appearance and quantity of new subject matter and general revision of old subjects, as we are now building upon the knowledge and experience of these latter days, when such wonderful strides are being made in the arts and sciences.

The entire work contains 475 pages and nearly as many engravings, a very large part of which belong to the modern half-tone class, showing nature and art as they really are. Something like 50 new full-page half-tone engravings have been put into the new book, most of which are printed on what is known as enamel book paper—the finest there is sold.

No pains have been spared to make this the fullest and most up-to-date bee-book that we have ever gotten out; and the very fact that nearly a thousand copies were sold, even before the edition left the press, goes to show that the general bee-keeping public appreciates our efforts in giving something really exhaustive and up-to-date.

No matter if you have an old edition, you can hardly afford not to have this new work. While it is, in a sense, built on the old, it takes in all the latest and most modern ideas and practices known to bee-keeping.

Price, in cloth, 475 pages, gotten up in cyclopaedic form, postpaid, \$1.20; by freight or express with other goods, \$1.00; or clubbed with GLEANINGS IN BEE-CULTURE for \$1.75.

ADDRESS

THE A. I. ROOT CO.
MEDINA, OHIO.

GENERAL ITEMS

Questions About Honey-Dew.

I want to ask Mr. C. C. Parsons some questions about honey-dew being a natural secretion. (See page 546.)

Mr. Parsons, you say that the most copious honey-dew you ever saw was in 1897, and it was from the pine, and that it exuded from the leaves. Are you certain that it was not turpentine? I think you would better take your ax, go to those pines and cut notches in them, for you will get turpentine much faster than your bees can gather it on the leaves.

Why is it that honey-dew is never on the under side of the leaves, if it does exude from them?

I hope you will tell us more about it in your next. A. J. McBRIDE.

Watauga Co., N. C.

Bees Did Very Well.

Bees have done very well here this season. I have taken 2,500 pounds of honey, and expect to get about 2,000 pounds more, from 30 colonies, spring count.

My bees had the swarming fever badly this year. Some of the first swarms swarmed three times, and some of the old colonies cast three swarms—two swarms two months after casting the first. They have increased from 34 to 105 colonies, and are doing well, with the exception of four that are queenless. EDWARD KNOLL, Ontario, Canada, Sept. 6.

Quite a Poor Season.

This has been quite a poor honey season—cool and wet all winter and spring, up to about June 15 or 20. Bees built up very slowly on that account, and most colonies were quite weak when there was any nectar to gather. There was but little swarming; and out of 12 colonies, spring count, I will have about 300 pounds of honey, about half extracted; besides plenty of stores to winter on. Wm. H. BROOKS, Suobomish Co., Wash., Sept. 13.

But Little Surplus in California.

There will be but little surplus honey produced in this portion of California, and a good many bees have died of starvation. I have lost about 50 percent of my own during the past two dry years, and I judge from conversations with bee keepers that there will be fully that proportion lost throuout the county.

Last spring I made up my mind to let them get thru as best they could, but later

YOUR WAGON WHEELS

may need new rings, new spokes or new tires. These repairs have to be made every little while with wooden wheels. Stop all this expense for all time by buying a set of our

ELECTRIC Steel Wheels

They are made with direct or staggered oval spokes, broad tires, any height, and to fit any wagon. They can't rot, go to spokes and need no tire setting, last indefinitely. There is only one thing better, and that is our

ELECTRIC HANDY WAGON.

Our free illustrated catalogue tells all about both and gives prices. Send for it.

ELECTRIC WHEEL CO., Box 10, Quincy, Ill.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | 5lb | 10lb | 25lb | 50lb |
|-----------------------------|------|--------|--------|--------|
| Sweet Clover (melilot)..... | .60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover..... | .70c | 1.25 | 3.00 | 5.75 |
| White Clover..... | .80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover..... | .60c | 1.20 | 2.75 | 5.00 |
| Crimson Clover..... | .55c | .90 | 2.00 | 3.50 |

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight. Your orders are solicited.

512 Mass. Ave., INDIANAPOLIS, INDIANA.

Yellow Sweet Clover Seed!

We have it at Last!

We have finally succeeded in getting a **SMALL** quantity of the seed of the **YELLOW** variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium—

A Quarter Pound for Sending One New Subscription.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us **ONE NEW** subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

Notice! Friends!

This is your last chance for this season to get

* GOLDEN * ITALIAN * QUEENS

—OF H. G. QUIRIN—

as it is getting late in the season, and soon will be time to unite nuclei, so order **QUICK**. All Queens warranted purely mated, and by return mail, safe delivery and satisfaction guaranteed. Price of Queens, 50 cents; six for \$2.75; \$5.00 per dozen. Selected Queens, 75 cents each; six for \$4.00. Selected tested, \$1.50 each. My Queens are prolific and their bees excellent workers.

on I concluded I could not get along without some bees, and fed up what I had left, and have not lost a colony since. I had but two swarms out of 40 colonies, but most of them are now in good condition, and by dividing up the honey I think they will have stores enough for winter. Since the early forage dried up they have been getting their daily "bread and honey" from the eucalyptus (red gum), and some colonies are still storing a little surplus from that source. F. C. WIGGINS.

San Diego Co., Calif., Sept. 11.

Bees Did Nothing.

Bees did not do anything this season. It rained almost all of last month. The fireweed was in bloom then, and the bees did not have a chance to gather much of it.

H. GALLOWAY.

Skagit Co., Wash. Sept. 13.

"Just Simply Stop Breathing."

On page 294 is a quotation with the above title, given by A. P. Raymond. Some of the readers will perhaps be surprised to know that the very same thing, word for word, was published in Gleanings in Bee-Culture in the number for August 15, 1888. To the quotation Prof. Cook added this:

FRIEND ROOT:—I heard years ago of the absurdity that holding one's breath would exempt him from stings. I thought at once it was nonsense, but, nevertheless, I put it to the test. It was one of the most conclusive experiments I ever tried. I think the bee appreciated the joke, for I got one of the most painful stings I ever had.—A. J. COOK.

ADRIAN GETAZ.

Knox Co. Tenn.

Bees and Honey in Utah.

As far as Utah is concerned, this is certainly an off year, not only as regards the bee industry but in many other respects. In Salt Lake and several other counties, while the winter loss was not very severe (possibly about 10 percent), the month of May was a terror—it was wet and cold nearly the entire month. Considerable fruit was destroyed, and while possibly not over 25 percent of the number of colonies died, if we take into consideration the weak condition of those that were left, a few of which dwindled and died off in June and

WOOL MARKETS AND SHEEP, CHICAGO, ILL.

July, it will make the actual loss of bees considerably over 50 percent. Thru the causes named, the bees of a number of our bee-keepers were slow in building up, and the outlook was anything but flattering for them.

The honey-flow, as a rule, appeared to be all right, but this was of little benefit to the bee-keeper whose bees were not in a condition to gather it; still, with all our troubles, some of the bee-keepers who possibly were more favorably located and who succeeded in building up their bees, said they were getting as much, and in some instances more, honey per colony than they did last year. Six or seven places where I had bees the honey-flow was pretty good, but if we get many more May months like the one we had this year, this county at least will not rank as a bee-keepers' paradise. E. S. LOVESEY.

Salt Lake Co., Utah.

Bees in Good Condition.

My bees are now in good condition, and I received in all about 1 500 pounds of honey. I have increased from 25 colonies to 43.

H. L. F. WITTE.

Hennepin Co., Minn., Sept. 18.

A Young Bee-Keepers' Experience.

I contracted the bee-fever in 1897. In April I got two colonies in Hubbard hives, but I did not know how to manage bees except in the old way of letting them swarm and do as they pleased, and I had the bee-fever so badly that I could not rest. I had no books, no papers, no person to tell me anything more about the pursuit than I knew myself. I finally got A B C of Bee-Culture and some modern hives. When the hives arrived I commenced to put them together, and study the book, but the fever did not get any better; in fact it got worse. One of my colonies cast two swarms, and then I transferred the mother colony into one of my new hives, and the other colony cast one swarm. Then I transferred it; this filled my five new hives.

The first swarm that issued stored surplus to the amount of 45 pounds. I packed them on the summer stands for winter, and they pulled thru, but the spring of 1898 they died so that they were very weak in numbers, so the first of May I commenced to feed, and I soon had them strong again. I kept them from swarming by dividing. I increased to 10 colonies, and in September I built a house-apiary 12 feet square, and moved my 10 colonies into it in November. They wintered well in it.

This year (1899) I increased my bees to 17 colonies, and they are all in fine condition; they have stored a good deal of honey. There is a pretty good honey-flow here at present from fall flowers and buckwheat.

I find one trouble with my house-apiary, and that is, the young queens seem to disappear. I lost three queens out of one lot of seven. I think they must get into the

wrong colonies on returning from their wedding flight. Will Dr. Miller, or Mr. Doolittle, tell me how to remedy this matter? I have two-inch auger-holes thru the building two feet apart, and I keep the bees only on the east, south and west sides of the building. On the north side I have a door and window. This building will hold 32 colonies, and I want to increase next year to that number, so I want to know how to prevent this loss of young queens.

JAMES N. ALEXANDER.

Clearfield Co., Pa., Sept. 4.

In the multitude of counsellors there is safety.—Prov. 11-14.

Increase by Dividing or Swarming.

Query 105.—Do you prefer increase by division, or by natural swarming? Why?—ARIZ.

Dr. J. P. H. Brown—Natural swarming.

G. M. Doolittle—Neither. My object now is *no increase.*

Chas. Dadant & Son—By division, because we select our breeders.

Prof. A. J. Cook—Natural swarming, as most convenient and profitable.

R. C. Aikiu—By division. It is more convenient; I do it when I am ready.

Mrs. L. Harrison—Natural swarming. Because I'm not wiser than the Creator.

W. G. Larrabee—Natural swarming. More ambitious, and nearer Nature's laws.

E. France—We increase by division, then we don't have to keep a hand in our out-yards.

Mrs. A. J. Barber—By division. Because increase can be made so much faster by division.

O. O. Poppleton—I don't like either way. I prefer what is known as the "nucleus method."

S. T. Pettit—By natural swarming. Because I would get more honey in that way, and better queens.

J. M. Hambaugh—Could I always be on hand, natural swarming. They seem to work with more vim.

P. H. Elwood—By division. We couldn't manage them in several yards if we permitted them to swarm.

C. Davenport—I largely practice dividing. It is less work, and gives one better control or command of a yard.

Eugene Secor—My study is to *prevent* increase. If more bees are wanted, either method can be made successful.

J. A. Green—By natural swarming, because I generally want as little increase as possible, and keep it down all I can.

D. W. Heise—When I desire increase, I prefer it by natural swarming. Divisions have not been so satisfactory to me.

C. H. Dibbern—Natural swarming. If they don't swarm I do without, as I always get more swarms than I want, anyway.

Dr. C. C. Miller—I would rather never see a swarm. Too much trouble, and swarming interferes too much with the honey crop.

Mrs. J. M. Null—It depends upon the season. During a good honey-yield I prefer natural swarming, giving four Langstroth frames, with sections from the parent colony.

Rev. M. Mahin—If I want much increase, and have empty combs or foundation, I prefer division. If I want increase reduced to a minimum, and want honey, natural swarming. The "why" is very plain. I can make more colonies, and have them in

good condition, by dividing. I will get more honey and less increase by natural swarming.

J. E. Pond—I prefer dividing. The matter will depend largely upon circumstances and conditions. It seems to me to be an individual question, and one that each must decide for himself.

A. F. Brown—Natural swarming for best results in a crop of surplus honey, especially comb honey. If an attendant cannot be given the bees during the swarming season, I would prefer dividing.

Dr. A. B. Mason—By natural swarming, because it is less trouble and secures better results. If you don't want increase and don't know how to prevent swarming, follow the Heddon plan in hiving swarms.

J. A. Stone—Division, because you can divide more evenly than the bees are apt to do it, and while dividing you have the opportunity to destroy any surplus of queen-cells, and detect any wrong that may exist.

Emerson T. Abbott—By natural swarming. If bees are properly managed they will gather more honey, if permitted to swarm in the natural way. If bees, and not honey, was what I desired, I would divide them.

E. Whitecomb—If I desired to attend church on Sunday I would divide, otherwise I consider the natural swarming best. God arranged that for the bees, and when we attempt to thwart Nature a cog is pretty sure to slip somewhere.

R. L. Taylor—By swarming, because I want colonies as strong as possible for the production of comb honey. If I divided I might divide some that would not swarm at all, and dividing would not prevent others from swarming, after all.

Adrian Getaz—By division, for two reasons. 1st, because I can increase just what I want, and when I want. 2nd, because natural swarming occurs at a time of the year when all the bees are needed to gather surplus, instead of starting new colonies.

G. W. Demaree—If I wanted to increase my apiary rapidly, I would practice both the natural and artificial methods of increase. Why? Because then I would not be limited by any iron-jacket rule, and if Nature was tardy I would go forward and accomplish my purpose.

E. S. Lovesy—By division, because with proper management all colonies can be kept strong, which cannot always be done here by the swarming method. The swarm, as a rule, is all right, but the old colony is often a failure. But division must not be overdone; if it is worked just right, and if you keep your queens laying, and the bees working, if there is any honey-flow they will bring it in.

Convention Notices.

Utah.—The Utah Bee-Keepers' Association will hold their semi-annual convention in the City and County Building, Salt Lake City, Oct. 5, at 10 o'clock a.m. A full program in the interest of the industry will be presented. All are invited. Some prominent bee-keepers are expected to be present, and one or more meetings may be held at the State Fair. J. B. Fagg, Secretary.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held at the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1899. All are cordially invited. B. Kennedy, Sec. New Milford, Ill.

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 20 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now, and 1 1/2 miles from Prairie View on the Wisconsin Central railroad. The beautiful Desplaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber, one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, bass-wed, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc., J. B. AYERS, Libertyville, Lake Co., Ill. Please mention Bee Journal when writing

FOR SALE!

A small place of 11 acres of land, a good house and barn, with all kinds of fruit, 50 colonies of bees in as good a honey locality as there is in Michigan, the 1899 crop of honey being 1,000 pounds of extracted from 25 colonies, and increased to 50 colonies. Enquire of

HOG CHOLERA

We have no medicine to sell, but have an effective remedy which will check the ravages of the plague and save your hogs. The disease is caused by a germ. This preparation is a powerful anti-septic which destroys the germs without injury to the hogs. The material can be obtained at any village store at the cost of a few cents. Any farmer can prepare and apply it. If used in time is a certain preventive and a sure cure for hogs not too far gone. Full information with directions are given in a very valuable work entitled—'The Hog, by 15 Specialists' (Price 25 cts., postpaid.) Information on every phase of hog raising and marketing by the most eminent authorities, experienced hog raisers and packers in the U. S. and Canada. To save the millions of dollars annually lost to farmers through this plague we dare to give this book the widest possible distribution and at the same time introduce to new readers The NATIONAL RURAL and FAMILY MAGAZINE, America's Great-est Farm Journal for 40 years known as The Western Rural. Published weekly, 32 to 40 pages, fresh, up-to-date matter each week. Profusely illustrated. Subscription price \$1.00 per year. Sample paper free.

We Offer: To send The Rural 3 weeks on trial (price 25c) and a copy of the above work (price 25c) to any address for only 25c. Coin or Stamps Club Offer: For \$1 we will send 5 copies of each. For \$1.50 we will send 10 copies and a book, and a year's subscription to the club raiser free. Make up a club of 10 and thus assist in stamping out or preventing the swine plague, from getting a foot hold in your neighborhood. Address THE NATIONAL RURAL, Chicago, Ill. 39A3t Please mention Bee Journal when writing.

Save Your Hogs. SURE CURE and PREVENTIVE.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Sept. 26.—Fancy white comb honey brings 15c; No. 1, 13@14c; ambers, 10@12c; dark, 9@10c. Extracted, white, in cans, 7 1/2@8c; in barrels, 7@7 1/2c; amber, 6 1/2@7c. Beeswax, 20c.

The receipts are increasing and sales are becoming more frequent. Shipments are coming to hand in good order, and when properly prepared will do so until we get zero weather, after which it is liable to crack, and break away from the frames. R. A. BURNETT & Co.

KANSAS CITY, Sept. 14.—The supply of comb honey is very light. Scarcely any extracted on the market. We quote fancy 1-pound comb, 14@15c; No. 1, 13@14c; No. 1 amber, 12@13c. Extracted, white, 7c; amber, 5@6c; dark, 4@5c. Beeswax, 22@25c. C. C. CLEMONS & Co.

NEW YORK, Sept. 20.—Fancy white, 15c; No. 1, white, 13@14c; fancy amber, 11@12c; No. 1, amber, 10@11c; buckwheat, 9@10c. Beeswax dull at 25@26c.

Demand good for all kinds of comb honey, and ready sale. Extracted in good demand also, excepting buckwheat, at unchanged prices. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 25.—White comb, 11 1/2@12 1/2c; amber, 8@10c. Extracted, white, 7 1/2@7 3/4c; light amber, 6 1/2@7c. Beeswax, 26@27c.

The market remains unfavorable to the buying interest, and is likely to so continue through the season, with supplies of very moderate volume, not only here, but also in the interior.

CLEVELAND, Aug. 18.—New honey scarce and in good demand. Fancy white, 15c; No. 1 white, 13@14c; fancy amber, 12c; No. 1 amber, 10@11c. A. B. WILLIAMS & Co.

BOSTON, Sept. 21.—Fancy white comb, 1-pound sections, 16c; A No. 1, 14@15c; No. 1, 13@13 1/2c; No. 2, 11@12c. White amber extracted, 8@8 1/2c. Beeswax, 27c.

New comb honey is coming in very slowly, showing a general shortage all over the country. BLAKE, SCOTT & LEE.

BUFFALO, Sept. 22.—Receipts of honey very light indeed. Fancy 1-pound comb, 14@14 1/2c; fair to good, 12@13c; poor, less. BATTERSON & Co.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14@15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7@7 1/2c. PEYCKE BROS.

DETROIT, Sept. 11.—Honey-producers accustomed to selling in Detroit have hard work to satisfy local trade. Very little honey in market. White comb, 14@15c; dark, 12@13c. White extracted, 7 1/2@8c. No dark wanted. Beeswax, 23@25c. M. H. HUNT & SON.

WANTED. Comb and extracted honey; state price, kind, and quantity. R. A. BURNETT & Co., 33A13t 163 So. Water St., Chicago, Ill.

Wanted! Your HONEY We will buy it, no matter where you are. Address, giving description and price, 34A1 THOS. C. STANLEY & SON, Fairfield, Ill. Please mention Bee Journal when writing.

22nd Year Dadant's Foundation. 22nd Year

**Why does it sell
so well?**

Because it has always given better satis-
faction than any other.
Because in 22 years there have not been any
complaints, but thousands of compli-
ments.

**We guarantee
satisfaction.**

What more can anybody do? **BEAUTY,
PURITY, FIRMNESS, No SAGGING, No
LOSS,
PATENT WEED PROCESS SHEETING.**

Send name for our Catalog, Samples of Foundation and Veil Material. We sell
the best Veils, cotton or silk.

CONTRIBUTED ARTICLES

Apiary of Mr. F. G. Herman, of Bergen Co., N. J.

EDITOR YORK:— This cozy little apiary is located within the limits of a city. There are 60 hives in four rows, all of them full of bees at present, but not full of honey. I am

not out of fashion in this year of poor crops. The hives are what is called "light chaff hives;" they are 21 inches apart in the rows.

The apiary is covered with tan bark, which keeps all weeds and grass from growing, and absorbs all the rain, and is perfectly dry one hour after the sun shines upon it.

The fence around the apiary is a wire one, six feet high, and is covered with honey-suckles and grape-vines. When looking at the picture imagine you are facing westward; those tall trees in the background shade the apiary after 3 p.m. which is a pleasant feature to me, as it makes it more comfortable to work among the bees. You will notice in the middle isle a home-made chair; there is where I spend many a pleasant hour, and the bees hum me to sleep. I intended to be in the picture, but while I was getting

Apiary of Mr. F. G. Herman, of Bergen Co., N. J.

things ready for another picture, the photographer snapt this one.

The four years preceding this year I averaged 100 pounds of honey per colony, spring count; but this year it has dropt to about 35 pounds.

Bee-keeping is only a side-issue with me, my daily vocation being "wool finishing;" notwithstanding, with the help of a bicycle I can be my own salesman and market my own crop, and occasionally I have to buy more to tide me over.

F. G. HERMAN.

Queen-Excluders—Is their Use Advisable?

BY G. M. DOOLITTLE.

A CORRESPONDENT writes me that a bee-friend of his thinks there is no need of using queen-excluders over the whole top of the hive under the surplus arrangement, but just under the front and back end, putting a thin board under the center, and thus save laying out so much money on queen-excluders. And from what he further writes I judge that he fears that the bees will not work as well over the board as they would were the whole top of the hive covered with the queen-excluding metal. He closes his letter by saying, "Won't you tell us thru the columns of the American Bee Journal what you think in the matter?"

Well, I not only endorse those "fears" of the correspondent, but had he said he knew that bees would not work over the board as well as they would without it, I should have endorsed it equally quick. To be sure, I have known bees to go clear around division-boards and up into the cap of the hive, doing quite a business in this way building comb and storing honey there, but from close observation I am satisfied that the more perfect the connection between the brood department and the surplus arrangement the more readily the bees start to work, and the quicker the bees start in the sections the better the results in the number of pounds of honey.

But I think I hear some one say, "If this is so, why do you recommend excluders at all, for the connection between the two departments cannot be as perfect with excluders as without them?" Very probably this is correct, but in reply I would say that it is not the largest number of pounds of honey that is always the most profitable to the apiarist; for if so, why not do as our fathers used to, hive our bees in barrels? Elisha Gallup once said that bees would store as much honey in a barrel or nail-keg as in any of the modern hives, and I have yet to hear any one dispute the assertion. Then why not do it?

Ah! but honey stored in this way is not in marketable shape. And honey stored without queen-excluders, especially where very shallow frames are used, is not always in marketable shape, for thousands of sections have been spoiled for market by having brood in them where excluders were not used. I contend that more honey in marketable shape can be secured by the use of separators and excluders than can be without them; and this is just the reason why I use them.

Our correspondent hints that the reason for not using the excluding metal, but a board over the center of the brood-nest, is that the field-bees when returning with their loads of honey do not go up thru the center of the hive, but at the ends. I think this a mistake, for certainly the most of the hives of our fathers allowed them to go up nowhere else, and they secured much surplus in that way, my father taking as much as 75 pounds of comb honey from a single new swarm with a two-inch hole bored in the center of the top of the hive leading to the surplus department as the only means of communication between the two.

Then our correspondent asks further: "If the foregoing is right, does this theory not hold good concerning excluders that stand vertical? I am using large frames, and have much of my honey stored at the sides. Now when the bees march from the entrance toward the excluders do they not move along at the bottom of the hive? and do they not therefore go thru the lower rows of zinc? If I am right in this, how many rows would be needed before I used a thin board from them to the top of the hive?"

It is evident that my correspondent, as well as his bee-friend, is laboring under the delusion so often taught in the past, that the bee which gathers a load from the field must of necessity deposit that load in the surplus receptacles. For this reason outside entrances were made at the top of the hive, to be opened when the harvest came, so the bees

could go direct from the fields to the boxes, thus saving them that much of travel and time, for it was too bad to have them traveling and being jostled and rubbed against all the way from the lower entrance up thru the crowded hive in the dark, when they could just as well go right from the field by daylight to the combs where they were to store the honey.

However nice and practical this appeared, the coming of the Italian bee virtually stopt up this upper entrance, for it was soon found that when there were only black bees going in and out at the entrance, just before the Italians commenced to work in the fields, there were very few if any black bees in the sections; and a look thru the glass showed these black laborers giving up their loads of honey to the young Italians upon their return from the fields, allowing these nimble-footed young ones to run up-stairs with the honey, taking the shortest and quickest way they could, whether at the top or bottom, front or back end, or right straight up thru the center.

Moreover, it was ascertained that, unless there was a very large yield of honey, these young ones held this honey in their honey-sacs, or deposited it in the brood-combs right among the brood, wherever an empty cell was found, till it was sufficiently ripened to be stored in the sections or placed permanently in the combs.

It is about time that the average bee-keeper comes to the conclusion that bees have no paths staked out, nor lawns with "Keep Off the Grass" notices posted up so as to guide them in certain directions in which they should go with their loads of pollen and nectar. The natural instinct of the bees is to cluster with and about the brood, and deposit their honey above and around it, and the more they are allowed to conform to this instinct the better will be the results, only we must guide them enough so that their product will be in the most salable form when brought to a completion.

Onondaga Co., N. Y.

Description of a Wisconsin Bee-Cellar.

BY WM. M. BARNES.

MY cellar for wintering bees is 16x20 feet, and 6½ feet deep. It has a stone wall one foot thick and 3 feet high, then from where the wall rests the cellar is dug out 3½ feet deep in yellow clay, and is smaller all around by one foot than the inside of the wall, thus leaving an offset of one foot all around the cellar. The sides of the cellar are left sloping, so that there is no danger of the dirt caving off.

There are two outside doors made of matchit pine, being two thicknesses of lumber, with a parting strip of oak one inch thick all around the doors and between the two thicknesses of lumber, thus making a dead-air space in the doors. One door shuts even with the inside of the wall, and swings into the cellar, and the other door swings outward, and is 3 feet from the inside door. The wall at the doors extends down as far as the bottom of the cellar. The opening at the top of the doors and between them is covered with a trap-door, which is covered with galvanized iron. This trap-door can be raised when the other doors are closed, and secured, and the space packed full of straw or planer-shavings, if necessary.

From the outside door there is an entrance-way dug, and in this there is a ventilator 30 feet long, 8x10 inches inside measure, made of 2-inch oak plank. The outside end is wide open; the inside end extending inside of the cellar 3 feet, and the opening is closed with a register.

The upward ventilation is secured by a common 6-inch stove-pipe, the lower end coming down within 4 feet of the bottom of the cellar, the upper end extending thru the roof of the building used for a shop over the cellar, making the pipe 22 feet long, thus causing plenty of draft.

I now have the wall outside graded with dirt to the top of the wall, then 10 inches of old sawdust as banking around the building.

I moved my bees into this cellar Nov. 28, 1898, and kept a thermometer there. Up to Dec. 14 I found that the temperature was 41 degrees above zero—a little too cool, still the bees were quiet, and I thought the temperature might rise as the cellar dried out, as it was quite new. I had 96 colonies in the cellar, and could have put in 50 more without crowding.

I wish the older ones in the bee-business would show me my errors, and where my cellar may fail.

Richland Co., Wis.

Suggestions on Fall Work in the Apiary.

BY F. A. SNELL.

WITH favorable weather a fall crop of honey is generally secured in most sections of our country. With us, the fall honey crop varies much, some years we have a good one, others only a moderate or light crop. The apiarist should make due preparation for a fair honey-flow, and if it comes he is in shape to reap the harvest. This flow varies as to time of opening, some years the bees will, with us, begin storing some the latter part of August.

I aim to have a lot of cases in readiness to put on the hives by the 15th of the month. The unfinished boxes left over from the summer are all used, either in filling, or partially, each case. In using or about half filling with the built combs from summer, the remaining space is filled with boxes having foundation in each, and the latter are placed at each side of the cases. A few cases should be at first placed on the stronger colonies, and these watch to see if honey is yet abundant enough for storing surplus, which can be readily seen thru the observation glass. If the yield is sufficient, the combs will be drawn or built out, and honey stored in them. The comb foundation in the side boxes will be built out, and the central combs given such will be pushed toward completion.

I seldom at this time of year give any colony over two cases at one time. When the honey-flow is moderate, one surplus case will suffice. The amount of room given, or rather needed, can be determined by experience, and must be governed by the honey-yield at the time. As the cases are completed they should be removed from the hives so the capping will not be darkened by the bees traveling over them, or coating with propolis or darker wax. The bees should be given new cases if needed, and such all ready to put on should be made ready in advance.

As the fall flow draws to a close, the surplus-room should not at this time be more than one case, for at the close of the summer flow it is desirable to get all the complete combs we can for sale or use.

As the honey in the fields becomes less, the bees are inclined to rob, and no honey should be left exposed, for this reason.

At the close of the fall yield all boxes should be removed from the hives and stored in the honey-room. The fall honey should be kept entirely separate from that secured in summer, and racked up the same.

The next work of most importance to be done is the sorting and crating of the honey. Two grades of fall honey are generally harvested, and should be crated as such, as a rule. After the honey is all crated it should be marketed as rapidly as one can do so. The honey not sold by Oct. 10 would better be kept warm by artificial heat, so it will not assimilate moisture.

The partially-filled combs should be emptied of honey by means of the honey-extractor, and all boxes and supers cleaned of propolis. The supers should be filled with boxes loosely so bees can pass between them, and on warm days placed out, so that all honey may be gleaned by the bees. Not a drop should remain in the combs. After all have been thus cleaned, they should be stored for winter and next season's use.

All colonies short of honey should be lookt after early in September, and supplied with enough honey to last until spring; nuclei united or used with queenless colonies early in the fall. This kind of work should at all times be done early, if possible.

Where a part of the apiary is run for extracted honey it should also be removed from the hives at the close of the honey-flow, and thrown from the combs, and the supers stored away for the season.

Not later than Oct. 1 every colony should be in good shape for winter. The cappings secured from extracting after draining should be soaked and rinsed in water, and the latter put into a barrel to be made into vinegar. The cappings should be made into wax or put away until next summer, if to be made into wax by the solar extractor.

The apiarist who produces considerable honey should see that his home market is at all times well supplied with honey, when he is able to do it. He should also seek customers in all directions, and open up new points for sales of his honey. This requires quite a good deal of time, and is really a part of his fall work. The fall months, like those of summer, are busy ones for the extensive bee-keeper.

The bees to be wintered out-of-doors should be packed during the latter part of October or early in November. The bees to be wintered in the cellar should be made ready to place there early in November, so that when rough weather

comes the bees may be promptly put in. It is very desirable that the bees have a good flight just before their removal to the cellar, and as soon as the weather is cooler place them in for winter. This done, and the honey mostly disposed of, the season's work is about completed.

The author, teacher, and most successful honey-producer of his day—Moses Quinby—said, "Bee-keeping means work," and this is as much a fact to-day as when uttered many years ago by Mr. Quinby. No apiarist can do much at the business who will not work earnestly and faithfully. We must work to win.

Carroll Co., Ill.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 598.]

The following paper by Mr. W. W. Somerford, at present from Texas, was read next:

Possibilities and Difficulties of Bee-Keeping in Cuba and Porto Rico, and the Effect of Our New Relations With these Islands on Our Honey Market.

Possibilities and difficulties—the subjects assigned myself and Mr. Craycraft to discuss—are subjects that we both have had experience in, especially the difficulties. The main one encountered so far is a very serious difficulty, one that but few of Cuba's modern bee-keepers have escaped. So plentiful and so scattered is that terrible difficulty that we have nearly all had a sight and a whiff of it. It is foul brood, scattered broadcast over the land, Cuba's fair and fertile land, "the bee-keepers' paradise," except for foul brood.

The disease is one that some writers seem to think amounts to but little, yet I have known over \$100,000 worth of bees to dwindle out of existence from its ravages in Havana Province *alone*; and I still know of hundreds of colonies on the same road to sure and certain death, as none so far have escaped after contamination; and the afflicted ones have been sold and hauled hither and thither until the question is with the knowing ones, Where can I locate and be safe and secure? Where, oh, where? The wisest bee-keeper on the island of Cuba would not dare to answer the question with any certainty or assurance, for, if he did, he might "get left" as the most of us have. Yes, left without bees, with only infected hives and experience as future capital—and books (foul brood books) that tell all about how it can be cured so easily in the hands of the careful and studious; but, then, I have known men of culture, educated in the languages, graduates of our best universities, *all to fail*. Even common, practical men fail: men who have given the better part of their lives to bee-keeping fail. Fail when it comes to curing foul brood, where there is eternal sunshine and summer and big apiaries. All have failed so far in Cuba to cure the disease; and I consider it the only great "difficulty" that a bee-keeper has to contend with, or may have to encounter.

Mr. Craycraft wrote me a few days ago that the leading bee-keepers of the island had a move on foot, and were whooping it up, to establish a foul brood law, with an inspector to inspect and condemn all infected apiaries. The "leading bee-keepers," I will add, that are in the move, are the ones that foul brood has led out of the business. So the law, if past, is sure to be effectual, as I understand one of their number is to be inspector, and will pass the death sentence where the disease is found. Then, Mr. Craycraft says, a bee-keeper can keep bees with a certainty of success, but not until then.

As to possibilities, they are great when it comes to bee-keeping and honey-producing in Cuba. It will take time to tell the story as to what can be accomplished. I knew a bee-keeper to claim 40,000 pounds of fine white honey from 100

colonies in a single season, and I am sure better reports will come in the future under our new relations, for Cuba is surely a honey country. I, myself, took, in 90 days, from an even 100 colonies, over 2,000 gallons of the finest honey I have ever seen. But where is that 100 colonies now? And still another 150 that I used to have in Cuba? All dead. Yes, *dead*. Doctored to death with foul-brood cures—cures that *would not* cure in Cuba. But I will try it again. I will embark for Cuba in September, as big apiaries under sheds are fascinating to me until contaminated with Cuba's contagious "difficulty," foul brood, or "bacillus alvei," as Prof. Cheshire, England's great scientist, called it.

As to Porto Rico, I have not been there yet, but my friends who have, say it is no such a honey country as Cuba; but, of course, it may be better; I do not know.

"The effect of our new relations with these islands on our honey market"—they will have but little, if any, effect for years to come, and if they do it will be to create a market for fine honey, in many places where none is produced, and but little consumed *at present*, as is the case in many parts of the South, where the quality of honey is *bad*, and the crop uncertain, and consumption amounts to nothing. In such places thousands of tons of Cuba's fine honey could find a market. But for European buyers, it is not likely that much honey will come into our American markets from Cuba, as her market is already established in Europe, and has been for more than a century.

W. W. SOMERFORD.

The above paper was then discussed as follows:

Mr. Selser—I notice that the people who talk about the market do so to mock us.

Harry S. Howe—I am going to be down there soon, and shall learn what there is to learn.

S. A. Niver—I, too, want to take issue with Mr. Selser. I have had little experience, and I have compared the honey-dew with good honey. Come to York State and see how we do things there.

Dr. Miller—Mr. Selser is nowhere when New York gets after him.

The next paper was read by Mr. W. Z. Hutchinson, of Michigan, on

Bee-Keeping as a Profession.

The time was when many industries were represented in one family. Flax and wool were grown, spun and worked up into cloth and made into clothing. Cows were kept, and cheese as well as butter made for home use. Poultry and a few colonies of bees added to the comforts of the household. But there is no need of going into detail; every one knows how people lived 100 years ago. Cheap and rapid transportation has encouraged the invention of machinery, the building of factories, and the classification of labor. This has brought about *specialty*. No one disputes that this condition of things is better; by it our comforts are more than trebled.

Some industries branch out as specialties much sooner than others. Bee-keeping was among the later ones. At last, however, it has been recognized as an industry of itself. How does it compare with other professions? What are its advantages and disadvantages? Can it be depended upon as a means of livelihood? These are questions that have come to all of us, and will continue to come to all who enter our ranks.

I believe it is well understood that bee-keeping is not an occupation in which we can easily become wealthy. In the very nature of things it cannot be otherwise. Like the keeping of poultry, the raising of small fruits, gardening, and other minor branches of agriculture, the keeping of bees in localities adapted to the business can be depended upon to furnish their owner a comfortable living; but such fortunes as are amass in merchandising and manufacturing can never be hoped for by the bee-keeper.

Fortunately, however, the perfection of a man's happiness bears but little relation to the size of his fortune. Many a man with the hum of bees over his head, finds happiness sweeter and deeper than ever comes to the merchant prince with his cares and his thousands. Bee-keeping is an ennobling pursuit. It keeps a man close to Nature's heart. It brings out the best that is in him. But can it be depended upon, year after year, as a means of supporting one's family? In some localities it can; in others it cannot. Where there is only one source of honey, and that an unreliable one, a man learns, sooner or later, that he cannot depend upon bees alone.

If a man is to adopt bee-keeping as a profession he must choose a location possessing at least one unflinching

source of honey, or else several sources, some one or more of which will be quite likely to furnish a crop.

Many who attempt bee-keeping as a specialty, are lacking in business methods. They attempt too many make-shifts in the way of hives, implements, buildings, and the like. To become a successful professional bee-keeper a man must first find a proper locality, as I have just explained, then he must secure the best stock procurable, put up suitable buildings, wintering cellars, if necessary; have the best of hives and implements, and *keep a large number of colonies*. I think many fail in this point. They keep only bees enough to bring in an income during a good year, or, possibly in an average year, and when one poor year follows another, two or three times in succession, want stares them in the face. Keep bees enough so that when there is a good year or two, enough money may be made to tide over the poor seasons that are sure to come. The very fact that the bees are scattered about in out-apiaries, several miles apart, adds to the certainty of a crop; as one locality often yields a fair crop while another a few miles away yields nothing.

With a man adapted to the business, a suitable locality, and the adoption of sound business methods, bee-keeping will compare favorably with other rural pursuits.

Believing that the mission of a paper is best fulfilled when it introduces the subject, rather than exhausts it, I bring mine to a close.

W. Z. HUTCHINSON.

Mr. Doolittle—I don't like to see time run to waste, neither do I want to oppose anything that so intelligent a brain as Mr. Hutchinson's has brought forth. He told us how agriculture, in many branches, has ceased, and the masses are not happier. Mr. Hutchinson, I want to say this, and enforce it by telling a story. One of those long-faced brethren was riding one day, and came across a young man walking, and asked him to ride. Presently they entered a deep wood; he thought he was called upon to speak to the young man about his soul, so he asked him the question, "Are you prepared to die?" and the young man jumped out and ran away. Now, I want to say to you, that anything that kills our happiness is wrong.

Mr. Hutchinson—What is your point, Mr. Doolittle?

Mr. Doolittle—The point is, that no people are happier than when working for a home. And this speculation that our people have gone into has spoiled our homes. A hungry dog cannot fight. You may run up a flag, but you cannot force people to respect it.

Mr. Hutchinson—When I first went to my present home, we kept a cow, had a garden, etc., but the work in the garden came at the same time as the work in the apiary, so I laid by the cow and the garden.

Dr. Mason—Mr. Doolittle says a poor, hungry dog can't fight, so he must mean that the dog that is well fed and sleek can fight the best. Now, that is all right, and I agree with him. (Several "If not too fat.") But what makes that dog poor? Is it not his own fault? In our locality (and you know localities differ), there are too many who have not the backbone, or the principle, to make use of the means at their command, to make home happy, and blame the more fortunate for their success.

W. E. Flower—This reminds me of a story of an Irishman. He and his wife quarreled. She said to him, "Look at the dog and cat. Did you ever see anything more peaceable than that?" The husband paused and looked at the creatures, then said, "Just tie them together tight, and, faith, I think then they'll fight." Taxes are so high I do not want a home. If I am going to spend all my income for taxes, I am better off without a home.

Dr. Miller—The question is a serious one. If a young man should ask me to-day if bee-keeping is a profession that pays, I would not dare to say it is, as safe as a profession as it was 20 or 30 years ago. I think Mr. Hutchinson was very wise in putting it that way, that it is not a matter of dollars and cents. Perhaps I may rest and strengthen up while following this profession; I am a bee-keeper, and I find time to go fishing. We get our pleasure as we go along in our occupation. I am enjoying my bee-keeping. That is my vocation, and I believe I can enjoy it as a profession.

Rev. E. T. Abbott—You have gotten on my hobby. This talk about bee-keeping as a specialty all sounds very well, but I don't think there is a man in the room that makes his living out of bee-keeping. There is something else combined with it.

Mr. Doolittle—I do.

Rev. Abbott—Where is your farm?

Mr. Doolittle—Bees bought it.

Mr. Abbott—Do you have no income from the farm? Bee-keeping has only one mission in the United States, and that is to make the home happier and better. Mr. Hutchinson and I have to sell papers, and it is a fact that bee-keeping will not succeed as a profession in half a dozen States. But for broken down doctors, and preachers that never could preach, it is a splendid thing. When we talk about a living, we would better keep still.

Mr. Doolittle—You will excuse a little personal story. I was brought up a farmer. My father thought so much of me that he wanted to keep me with him. If there is any young man present, let me say to you, don't be fool enough to do it. I bought my father off. I earned \$600 working out, for I saw that I could barely make a living from the farm. I bought some bee-papers; I was up in my loft and I overheard father talking to a neighbor, and father said, "I hoped Gilbert would be a farmer. I have even prayed that he would fail in bee-keeping." The bees have bought everything that I have. They bought my home, and Mr. Abbott cannot drop it out, for it is there.

An Attendant—I do not own a foot of land, but I have some bees. The gentleman said that the place to keep bees is on the farm.

Mr. Doolittle—There are some great facts before us, and it is well to understand them. In 1877, as a friend of mine and I went to New York with some honey I told him that we were getting some cheap rides at six cents per mile. As we went to Canada afterward, I said, cheap riding at two cents per mile. But how did you get your money? With honey at 9½ cents per pound; and I measured that I was paying six cents per mile in Canada, and I figured that I was paying nine cents per mile in 1877. The little a man got 20 years ago is two-thirds less now.

Dr. Miller—I want to ask you, Mr. Doolittle, if your bees have averaged as much in the last 10 years as in other years?

Mr. Doolittle—Yes. In the first year of my bee-keeping life I secured 66½ pounds of honey per colony. I don't know as I shall ever see it again. This year was a poor year, but my bees averaged 135 pounds per colony.

After a song by Mr. Haule, which was encored, the convention adjourned until 9 a.m. the next day, Sept. 6.

[Continued next week.]

Report of the Central Texas Bee-Keepers' Convention, Held at Milano, July 20-21, 1899.

BY LOUIS SCHOLL, SEC.

[Continued from page 615.]

FIRST DAY—EVENING SESSION.

The meeting was called to order at 8:30 p.m., and on motion O. P. Hyde was appointed a committee on program for the next meeting.

BEST RACE OF BEES.

"What is the best race of bees for each and every bee-keeper to use for all purposes?"

A. C. Brown gave his experience with Italians and hybrids. The Holy-Land bees he found to be very gentle instead of being stingers. The queens filled the frames full of brood, and they gathered large crops of honey. He prefers the Holy-Lands, if they are like those he had.

B. A. Guess prefers Italians, as they have done well with him.

Mr. Raven started with blacks, then hybridized, and prefers them.

Mr. Atchley says that for all purposes the Italians; for many purposes, the Holy-Lands; for many things, others. He has handled Italians for 25 years, and prefers them for all purposes.

O. P. Hyde had experience with blacks and Italians, which have some features he does not like. The Holy-Lands are better, and don't fill the brood-nest with honey like Italians, which crowd out the queen. Holy-Lands work better in supers. For all purposes he prefers the Italians.

J. B. Salyer—Pure Italians—goldens.

Jno. Pharr says a third cross between golden and Holy-Land is the best honey-gatherer in this country.

G. F. Davidson finds the goldens most beautiful, both for pleasure and business. He wants no hybrids and blacks, and has had no experience with Holy-Land and Carniolan bees.

Judge Terral defended the old three-banded Italian for all around purposes. □ For gentleness they are the best bees,

and if they do crowd out the queen in the brood-chamber it is all the bee-keeper's fault for not attending to his business to extract from the brood-chamber to provide room. Hybrids follow him around all day; also the Carniolans, and they are the worst to rob. He has had trouble with neighbors on account of their robbing. Carniolans are no better than the common German, and worse to sting. He can't handle them without smoking and smoking them. The Holy-Lands are worse than all, and fight him every time he goes into the yard. Then his bee-yard grew up in grass, weeds and horsemint, several feet high, and every time he went into the yard it went *zzip, zzip*, and there would be a big rattlesnake right before him. "Yes, sir! give me the straight, old three-banded Italian. It's the best all around bee for America."

Pres. Jones asked the Judge how much experience he had with Carniolans.

The Judge somewhat hesitatingly said that it was a long time ago, and he believed that they might have been Carniolans.

H. H. Hyde said there is a difference between golden Italians and Holy-Lands. He likes a direct cross between a Holy-Land queen and a golden drone for honey-gatherers.

F. L. Aten strongly defended the hybrids; as he is not keeping bees for pleasure he has to depend upon them. Hybrids hunt honey all the time, while Italians lie around doing nothing. The Holy-Lands are not so good. Hybrids are the all-purpose bee, and build nicer combs than any other bees.

Mr. Atchley said that really we were not discussing the right subject. When moving bees lately he placed Holy-Land, Italian, golden, Carniolan, and other colonies about in one yard, and at the end of the honey season the Holy-Lands had about 25 pounds more honey to the colony. The Holy-Lands are the bee for quick work and storing honey. But for all purposes and everybody he recommends the three-banded Italians.

Pres. Jones said it was a hard thing to answer this question. The three-banded Italians are good. Some prefer hybrids, and he thinks he would like a hybrid himself. Carniolans and Italians are the most gentle, and also good in other qualities.

Messrs. Madeley, Guess and others gave their experience with hybrids, while others did not know.

FOUNDATION IN THE BROOD-CHAMBER.

"Shall we use foundation in the brood-chamber, and how much?"

H. H. Hyde and Mr. Salyer said full sheets all the time. Under all conditions the best results are with full sheets.

Judge Terral—Full sheets during the honey flow; slow flow not.

Mr. Aten said full sheets when he uses it.

Mr. Atchley says it is money thrown away during a slow flow; in a fast flow he wants full sheets. It pays to use full sheets for swarms during a fast flow, as they need storage-room. They will build two-thirds drone-comb with an old queen without full sheets.

Mr. Davidson uses full sheets during a fast flow to prevent large quantities of drone-comb; no advantages of full sheets in sections; but best when wiring frames.

O. P. Hyde advocates full sheets for both brood-frames and sections; also for both fast and slow flow, and wired frames. Bees build all worker-comb with full sheets.

Pres. Jones said that in some times and some instances full sheets are perfectly useless; in other instances bees built out full sheets during the slowest flow. He never uses full sheets for swarms when run for comb honey, as bees store all the honey below, which he wants in the sections above. Therefore, he uses starters in the brood-frames of swarms; only circumstances differ.

The convention then adjourned till 8 a.m. the next day.

SECOND DAY—FORENOON SESSION.

The convention was again called to order at 8 a.m., and the following question taken up:

USING FOUNDATION IN THE SECTION.

"Shall we use starters or full sheets of foundation in sections?"

Mr. Salyer—Yes.

F. J. R. Davenport—It depends upon circumstances.

Mr. Guess uses full sheets or none. No complaints from customers.

Mr. Atchley—No.

A. C. Brown—Full sheets sometimes. Bait sections are best to get bees up into the supers.

FASTENING FOUNDATION IN SECTIONS.

"Best method of fastening foundation in sections."

Pres. Jones spoke on the subject. He told about a fastener he made himself, which was better than the Daisy, as the latter did not do neat work; while the heating plate of his machine slants to the front, causing the melted wax to run into the section, that of the Daisy causes the wax to run to the back, over the lamp and everything. He has objections to those already on the market.

Mr. Scholl was requested to show the workings of his foundation fastener, which was generally endorsed.

GETTING SECTIONS WELL FILLED.

"How can we get section honey well filled all around?"

Mr. Scholl Use the Hyde-Scholl separators, and see.

H. H. Hyde, E. J. Atchley and others advised using the Hyde-Scholl separators and full sheets of foundation.

O. P. Hyde There are four things necessary: 1st, an overflowing colony of bees; 2nd, a good honey-flow; 3rd, full sheets of foundation; 4th, Hyde-Scholl separator.

BEE-PARALYSIS.

"Bee-paralysis; can it be cured? If so, how?"

Messrs. Davenport, Atchley, the Hydys and others said they didn't know.

Mr. Brown's experience was given. He described the bees with the disease. They lookt sleek and shiny, and swelled up; trembled all over, and were generally carried out by their comrades; used salt and water in barrels where bees got to it about one tablespoonful of salt to a bucket of water. The first year he did not see any difference, but the second year it disappeared. He did not know exactly whether this cured it, or whether it was something else.

Mr. Davidson had but little experience with it. Diseased bees are sleek and shiny. Don't mistake robber-bees for them, as the diseased bees are swelled up, and tremble; otherwise they look shiny, like robbers.

Mr. Davenport gave his father's experience. Remedy: One-half honey and one-half sugar, boil and strain. Feed to the bees after night. The disease disappeared.

Pres. Jones had several cases, and tried the following solution, applied with an atomizer; thoroly saturated all parts of the hive and combs, and the third day the bees started to work again and gathered a good crop:

Sulpho calcine $\frac{1}{2}$ ounce, salt 2 ounces, dissolved in one pint of water; add one pound of extracted honey. Mix thoroly and apply. Remove the diseased colony a few feet, put a new clean hive in its place, and put the combs back into it.

The next year he weakened the solution, and on the fifth day there were still signs of paralysis. After a week it was gone, and the bees commenced work.

Mr. Brown tried some experiments to see how contagious it was. He hived swarms with colonies having the disease after the bees all hatched, and there was no more paralysis after that.

Mr. Atchley said that he, long ago, with Dr. Howard, made several microscopic observations, and found that certain food taken by the bees, without having cleansing flights, caused them to get a fever, which they then called "bee-fever."

[Concluded next week.]

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

CONDUCTED BY

DR. C. C. MILLER, *Marengo, Ill.*

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

What Causes the Brood to Die?

In examining the bees in this county, I find in some places about one-half the sealed brood is dead. No one here seems to know the cause or any remedy for it. Unless it can in some way be checked, it will ruin the bee-industry, I think. It is entirely unlike foul brood. The unhatched dead bees are fully-developed in size and all their parts, but die before hatching, turn a dark color, and dry up in the cell. In view of the fact that most of the bees here have been in-bred for years, and no new blood from any source introduced, I have been inclined to believe it might be caused by in-breeding.

COLORADO.

ANSWER.—Continued in-breeding for years might result in a weakening of constitution, making the bees succumb more readily to any disease, but such a wholesale and sudden weakening as to make half the brood die in the cell would not be likely to occur. It might be a good plan to send a sample of the brood to Dr. Howard or Mr. McEvoy.

Very Likely Caused by Worms.

What is the matter with my bees? For a long time they have been bringing out dead brood from the hive, in the nymph stage, and also full-grown bees. Indeed, frequently the bees brought out are alive, but when alive they always have a thin membrane attached to them on various parts of their bodies. I have examined the frames, but see no signs of worms. The colonies are greatly weakened in consequence of the brood dying.

ILLINOIS.

ANSWER. In spite of your seeing no signs of worms, it is possible that they are the culprits. If you take out a comb and examine it, you may see no silken gallery such as are commonly made by wax-worms, indeed no sign whatever of the presence of worms, unless it be that here and there some fully mature young bees seem to be struggling to get out of the cells, apparently fast there. Pull out these wriggling bees and you will find at the bottom of the cell a lively, slender worm about half an inch long. I think it is different from the usual wax-worm.

Combs of Pollen Wood-Bound Zincs.

On examining a 10-frame colony I find in the brood-chamber no eggs or larvae; in most of the combs a majority of the cells are filled from one-third to two-thirds full of pollen, except a strip at the top, or a patch in one corner, which contains old capped honey. I find no evidence of young bees, either. On top of this hive is a full-depth extracting-super containing 10 frames of honey. During the basswood flow the bees filled with honey the upper portion of these super-combs, which they drew out from full sheets of foundation; the balance of the combs with brood. Some four weeks since examination disclosed this brood where I supposed there was honey. My hives having no honey-boards on, I then procured some Tinker zincs, wood-bound, and placed them over the brood-chambers, shaking and brushing all bees below that were in the supers. In the meantime all this brood has hatched and bees are filling the cells thus vacated with honey, but storing none in the brood-chamber.

What is true regarding brood in the super of this colony is true of nearly all my colonies. But since I placed the zincs over them many colonies seem greatly hampered about getting into the supers. The wood-bound zincs are not made right. On one side the frame is elevated above

the zinc, on the other side not; so whichever side I place uppermost, the bees, between many frames, are partially or wholly prevented either from getting out of the brood-chamber or into the super.

1. What should be done with the combs of pollen? I have other colonies in much the same condition—or they were when queenless, and now that they have queens the pollen remains. There is little room left for the queen to deposit eggs, and if honey is stored over the pollen I fear the combs will not hold enough for winter. Can the bees be made to clean out this pollen? and how?

2. Is there any supply manufacturer who makes a wood-bound honey-board with two rows of holes between the slats, like the Tinker zinc, and raises the frame on both sides? If so, who? It is a disappointment and a nuisance to buy supplies and have them practically valueless.

NOVICE.

ANSWERS.—1. If I understand the matter rightly, you have a two-story hive, the "full-depth extracting-super" on top having frames the same size as those below. The queen having gone into the upper story, the bees made that the brood-chamber, only they dump the main portion of the pollen in the lower story. Either story might be used as the brood-chamber, only if you use the lower one there is more pollen than is needed, and if you use the upper one there is perhaps a scarcity of that article. You can even up matters by taking part of the combs of honey from the upper story and putting them in the lower story, where the queen now is, and putting some of the pollen-laden combs from below in the upper story. Possibly there is no more pollen in the hive than the bees will want to use before another honey harvest, and next spring it may be a good thing to put back in the brood-chamber the pollen that you now remove. Indeed, if you put it in the upper story next spring, you will find it gradually disappear from there, altho it may be better for you to put it in the brood-nest. Bees use a very large quantity of pollen for brood-rearing in spring. The use of a queen-excluder will prevent the same thing from happening again to some extent, but there will still be an accumulation of pollen if the colony is queenless, the plain remedy being to keep the colony supplied with a queen.

2. It is hardly likely that any manufacturer keeps in stock queen-excluders with a bee-space on both sides, but any of them would probably make them to order. I cannot understand what kind of an arrangement you have that makes it desirable to have a bee-space on both sides of the excluder. The only thing I can think of is that either there is no space between your upper and lower stories, or that there is a half-space at the top of the lower story and a half-space at the bottom of the upper story. In most cases there is a full bee-space at the upper part of the lower story, and none at the bottom of the upper story. Then when the excluder is put on with the bee-space uppermost, there is a bee-space between the excluder and either story. You can nail little strips on the top of the brood-chamber, so as to make the proper bee-space there.

Questions on Sweet Clover in Georgia.

I am thinking of sowing some sweet clover seed for bee-pasturage, and want some information along that line. When would be the best time to sow in our latitude, this being about the 33°?

How much seed per acre on common land that has been resting a year or two? and would it be better sown in drills or broadcast? Is it best sown in the fall, or spring? Do you think it will do well in middle Georgia? How tall do you think it will grow here? How much honey do you think it will produce to the acre in our latitude? How much hay to the acre do you think it would make? When would be the best time to cut it? GEORGIA.

ANSWER. I cannot answer your questions with any degree of positiveness, and shall be glad to be corrected by any Southern bee-keeper of experience with sweet clover. In some parts of the South it has been reported that sweet clover does not flourish, but in most places I think it does, especially in soils where lime is present. Thirty to 60 pounds of seed may be sown to the acre any time from the ripening of the seed this fall to the time when other clovers are sown in spring, success being better assured in the North, and perhaps as well in the South, if the ground is packed hard, as by tramping with stock. In your climate it is likely that there is little or no choice between drill and broadcast sowing. It will grow all the way from four to seven feet high, making from a half more to double as much hay as red clover. Just how much honey an acre of sweet

clover will yield has never been ascertained, and not even a guess has been offered. Please remember now that I don't know anything positively about sweet clover in Georgia, and I trust some good Georgian will set right anything in which I may be wrong.

Honey from Colonies that Died.

1. I had a very fine looking queen in a colony that wintered, and a little over half the brood would be workers in the spring, and the remainder were drones in worker-cells; then nearly half would die, some before others, after being capt, and after remaining a while a small hole would come in the capping. But there was no odor from dead brood, nor was it roapy. I killed the queen and introduced another, leaving all their comb except one sheet that was quite full of dead brood, and they have built up to a nice colony, no more disease showing till this fall. A full colony that stored two supers of honey got in the same fix, and as there was but little coming in I preferred it to die rather than have robbing commenced. There was plenty of honey in each hive, so I conclude it was not pickled brood.

2. Will the combs convey the disease to the next colonies that I give them, as there is considerable honey left in the last one? VIRGINIA.

ANSWER. While there might no harm come from feeding that honey to other bees, it may be wise to take no risk whatever. If the honey is nice, the safer plan will be to use it on the table, melting it up if that is preferred.

How Queens are Superseded.

When bees supersede their queen do they kill her, do they drive her out, or do the young queens kill her? I found an old queen and 50 or 100 bees in the grass four or five rods from any hive; the queen was an old yellow Italian that I got last year. I put them into a hive till morning. It was in the evening, about five o'clock, and they were all gone the next morning. That colony sent out a second swarm with a young queen. She had led out a first swarm six or eight weeks before. IOWA.

ANSWER.—In some cases, at least, it seems that neither the bees nor the young queen kill the old one. Sometimes an old queen will continue to lay for some time after a royal daughter begins to lay, and in such case I've tried putting the old queen in a separate hive, but generally she disappears in a short time, and in at least one case this summer the old queen seemed bent on getting away from the bees and leaving the hive. I don't know, but I have just a little doubt whether the young queen or the workers ever kill the queen that is superseded.

The queen that you found in the grass with a cluster of bees had probably left the hive with a full swarm; the queen for some reason being unable to fly, had crawled some distance from the hive, and a few of the bees had found her, the rest returning to the hive.

Preparing a Winter-Case for Bees.

I have no cellar to winter my bees in, and would like to winter more successfully than last winter. I have a number of old 10-frame Langstroth hives which I will discard, and use the 8-frame dovetailed hive instead. I also have a lot of cheap box-lumber. Now, I am thinking of taking the upper stories of the Langstroth hives and make them enough higher with this cheap lumber to take in a dovetailed hive with super on. I will also put a bottom to this outside case, on the inside of which I will nail 1-inch strips for the dovetailed hive to stand on, the same as it stands on the strips on its own bottom-board; then set the hive in the case, pack with a chaff cushion on the frames, then pack the empty space around the hive with chaff and over all place the old Langstroth cover. Of course, providing a place of entrance below. In your opinion, how will such a "trap" work for a winter-case? HOOSIER.

ANSWER. If the upper story of your old hive is long enough to take in the length of a dovetail hive, the plan may answer very well. You are not likely, however, to have another so severe a winter during an ordinary lifetime, and it might be well to try side by side at least one or two in the old way, and then compare results. It may be well to remark, in passing, that your chances for successful out-door wintering will not be increased by changing from 10 to 8-frame hives.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. OCTOBER 5, 1899. NO. 40

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Bee-Keepers Injuring the Honey Market. A honey-dealer here recently called on several of the large retail grocers in the heart of the city with a sample case of very fine comb honey, expecting of course that he could make a sale of a ton or two, as these particular grocers usually buy in fairly large lots. His comb honey was really fancy, and worth 15 cents a pound if it was worth a cent. But imagine his surprise to learn that some bee-keepers from the country had just been in and sold their honey to these grocers at 12½ cents a pound!

Now, this is only a fair sample of the manner in which some of the honey-producers themselves injure the honey market. It must be that they do not read the bee-papers or see the honey market quotations, else they would not be so foolish as to offer their honey for less than it is worth. Fancy comb honey should bring a good price this year—in fact, honey of all kinds *is* bringing a good price. So there is no excuse for any bee-keeper offering his honey for less than it is worth.

Advanced Prices. Supply manufacturers are marking up their price-lists—a step no doubt made necessary by the advanced prices they have to pay, lumber continuing to rise in price with no certainty where the end will be. Bee-keepers can stand this very well if they have a corresponding advance in the price of honey, and there is no little muttering because the quotations for honey are not higher.

There seems, however, to be a failure to notice that honey *has* advanced in price. A comparison of present

prices with those of a year ago will show that at least in several of the markets there has been an advance of from one to three cents a pound. On the other hand, bee-keepers may with good show of reason complain that all things considered honey is quoted lower than it should be. From all accounts there has been a smaller crop than has been known for many years. This alone should call for a rise in price if prices on all other articles should remain stationary. The general advance on all articles that bee-keepers have to buy, whether in their business or for the support of their families, is sufficient reason for a sharp advance if there was an average crop in the country.

Now put together the short crop of honey and the general advance in prices, and it is not unnatural that a double advance should be considered the right thing.

Shipping Bees by Freight in less than carload lots we believe can be secured soon if bee-keepers will interest themselves sufficiently in the subject. The Western Classification Committee will hold its next meeting in Milwaukee, Nov. 7. A petition requesting the rating on bees by freight in less than car lots has been presented to Mr. J. T. Ripley, the chairman of the committee. Now, bee-keepers should follow up this petition by letters urging that it be granted. Address Mr. J. T. Ripley, Chairman Western Classification Committee, Room 604, Great Northern Building, Chicago, Ill.

There is no good reason why bees in hives should not be sent by local freight just the same as live poultry or any other small stock. All that is necessary is to have the bees securely enclosed so that none may escape from the hive or box containing them. If small or large shipments of bees could be made as desired by freight, instead of by expensive express, no doubt many apiaries would be moved from one locality to another to catch a succession of honey-flows.

Apis Dorsata was discussed in convention by Australian bee-keepers. H. L. Jones read a paper moderately favoring their introduction. Mr. Pender thought they might be valuable for wax-production. Mr. Bradley said he had lived long years in India, and the man who would bring them into Australia should be prosecuted. They were migratory, as bad as wasps, with stronger colonies. Mr. Abram told of a gentleman who had gone to expense and travel and then decided to let them alone. Mr. Jones said a gentleman in Singapore was trying to domesticate them.

It begins to look as if a good deal of time and valuable space had been taken up in talking and writing about *Apis dorsata*. The Italian bee will likely "hold the fort" for some time yet.

Saltpetered Rags for Smoker-Fuel. Dr. Miller says in *Gleanings in Bee-Culture*: "I don't know of any way in which a bee-keeper can get more comfort out of ten cents than to spend it for a pound of saltpeter, put that in two or three quarts of water, wring rags out of it, dry them, and cut them up into pieces of 20 to 50 square inches, to be tied up into little rolls to start his smoker."

Rival Bee-Paper Editors is a subject touched on as follows by Editor E. R. Root in *Gleanings in Bee-Culture*:

If there ever was a fraternity of feeling among rival editors and publishers, it is among those connected with bee-journals. Once or twice Bro. York and I have occupied the same sleeper *en route* to conventions, and we were together much of the time afterward. This was particularly so in going to and from the Lincoln meeting. Well, this time Mr. W. Z. Hutchinson, of the *Bee-Keepers' Review*, and I arranged to meet in Cleveland, there to take a sleeper on to Philadelphia. We left Cleveland on the night train

via the Pennsylvania route; and, didn't we talk bees, things and men! The subject of amateur photography we just reveled in. We not only went to the convention together, but we came back together; and on arriving at Cleveland Mr. Hutchinson took the train with me for Medina, where he spent with us a little over a day in looking over the bees, visiting Vernon Burt, etc. All this may seem sentimental to some; but it means much to bee-keepers as a whole. If the editors of the leading bee-journals were clashing and pulling against each other, what would the result be?

On account of the great dissimilarity in the bee-papers of this country, there is scarcely any rivalry among them. It doubtless would pay every bee-keeper to take all of them, and at least two or three of the best.

There can be no good reason why bee-paper editors who do what is right should not be on friendly terms. We count the majority of them among our warmest friends, and do not hesitate to commend them and their papers whenever we feel it is deserved, and without expecting any reciprocation on their part. As a wise man once said, we expect to travel this way but once, and desire to do all the good we can as we pass along. Life is too short to spend it mainly in berating others, no matter how richly they may deserve it; and there is too much of real value to be published in the bee-papers to allow the space to be wasted in quarrels among those who should be friends.

Speaking Kind Words.—Dr. A. B. Mason, in the Beekeepers' Review, touches on this subject in these words:

"I really pity the man or woman that has neither the inclination nor the ability to say good things of others while they live, not waiting till they are dead. It has been a source of real enjoyment to me to read the kind words said of each other by the editors of our bee-journals. I believe there are very few people who do not like to be well spoken of. The truthful words, kindly spoken of each other, encourage to better efforts and better living. . . . May this new era continue to exist, and its influence widen till it covers the whole earth."

As bee-keepers have so much to do with sweetness, they of all people would naturally be expected to use "honeyed" words. Tho the bee is a worker in sweets, still it has a sting—but to be used only in defense. There are bees, too, that some people say have had their desire to sting bred out of them, making them non-stinging. We presume people might be so bred, also—brought up to use kind, pleasant words. It will pay to cultivate this characteristic, and thus help to continue the "new era" to which Dr. Mason refers.

New Edition of A B C of Bee-Culture.—We have received a copy of the new (1899) edition of "A B C of Bee-Culture," by A. I. Root, and just revised by Ernest R. Root. It is indeed a fine work, very interesting descriptions of which have been given on pages 603, 619, and on page 635 of this number of the Bee Journal. It is a book that every bee-keeper should own, and read thoroly. The regular post-paid price is \$1.20, but to all our subscribers who pay any arrears that may be due, and also \$1.00 for the Bee Journal for 1900 (next year), we will mail a copy of A B C of Bee-Culture for only 75 cents, provided the order is received before January 1, next. We make this same offer to all who have paid their subscriptions to the end of 1899 send us \$1.75 and we will mail you the book and credit your subscription for 1900. We make the same offers on "Langstroth on the Honey-Bee," revised by Dadant (1899 edition).

Crimson Clover is thus written about in a recent bulletin issued by the Department of Agriculture at Washington:

The use of crimson clover (*Trifolium incarnatum*) has increased to such an extent that it is now a standard crop in many parts of the Southern and Middle States. It is distinguished by its long head of brilliant scarlet blossoms and by the great depth to which its roots make their way. Wherever the winters are not too severe it thrives, and is a

valuable plant for soiling or for hay. It is a winter annual, the seed being sown any time from the middle of July to late fall in the Southern States. It grows thruout the milder weather in winter, and quickly makes a dense cover to the ground in the spring. This can be pastured, cut for hay, or turned under for green manure, or all three, depending upon conditions.

The seed of crimson clover is larger than that of red or mammoth clover, and is almost perfectly oval in shape. The fresh seed is of a bright reddish-yellow color, and has a high polish. As the seed becomes older the color changes to a reddish brown, and eventually the polish is lost, and the seed has a dull, dark reddish-brown color. Such seed should never be purchased, as it is too old to grow well.

In general the seed of crimson clover is less liable to contain many weed seeds than the seed of other clovers. It is harvested before most of the weeds have matured their seed, and being planted in late summer or fall it tends to choke out what weeds may come up with the young plants.

According to Mr. C. H. Lake, of the Maryland Agricultural College, bees produce pink comb when working on the blossoms of crimson clover. Mr. Lake wrote us as follows lately:

I note what is said in a recent number of the American Bee Journal about the pink comb from Maryland. When I again go down to the College I will get a specimen I produced two years ago. It will show for itself. Crimson clover is its origin, and the honey is also crimson, and not straw color, as claimed by experts, so-called.

C. H. LAKE.

MR. CHAS. DADANT, senior partner of Chas. Dadant & Son, called on us Monday, Sept. 25, when on his way home from a six-weeks' stay in Wisconsin, where he goes every fall to escape an attack of the hay-fever in his southern Illinois home. Tho nearly 82 years of age, Mr. Dadant is well and able to enjoy life all right. He reports his firm as having had a good trade in comb foundation this year, which we were glad to hear. We always like to know of our advertisers doing well.

MR. F. DANZENBAKER seems to deserve a good deal of credit for suggesting the use of springs, for holding the sections in supers. Editor Root, upon being asked who originated them, replies as follows in Gleanings in Bee-Culture:

"Those super-springs, as you found them in the supers, were devised by Mr. Fr. Danzenbaker. He got the principle, I believe, from Mr. M. H. Mendleson, of California, who uses a flat steel spring. It is more expensive, and not as well adapted to the purpose. From some correspondence that has come in of late, it seems others have been using something similar. But Mr. Danzenbaker says he was prior in the *specific form* of springs used in his supers."

ONLY A HYPHEN.—Stenog, the one who has control of the department of "Pickings" for Gleanings in Bee-Culture, in a recent issue of that paper is found "picking" on us in this fashion:

"Mr. York prints the name of this journal with a hyphen in Bee-Culture. Why not use one in American Bee Journal? Proper names should be printed as the owner writes them. Surely the hyphen should be omitted in the case cited."

Whereupon we referred to the Standard Dictionary, and found that the word "bee-culture" very properly appears with a hyphen. Strange that Stenog didn't know how to write the name of the paper to which he usually contributes so entertainingly. The Standard Dictionary is a pretty safe guide to follow, but we wouldn't think of objecting to so small a matter as an extra hyphen if any one wishes to put it between the last two words of the name of our paper.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | | | | |
|----------------------|-----|--------|--------|--------|
| | 5lb | 10lb | 25lb | 50lb |
| Sweet Clover (white) | 60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | 70c | 1.25 | 3.00 | 5.75 |
| White Clover | 80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | 60c | 1.20 | 2.75 | 5.00 |
| Crimson Clover | 55c | .90 | 2.00 | 3.50 |

Prices subject to market changes.
Add 25 cents to your order, for cartage, if wanted by freight.
Your orders are solicited.

Are Bees Out All Night ?

Query 106. Do bees sometimes stay out in the field all night? This question was prompted by seeing a bee heavily loaded with pollen Sept. 21, enter the hive about 4 o'clock a.m. UTAU.

J. A. Stone—Yes.

Mrs. L. Harrison—They do.

S. T. Pettit—Certainly they do.

Adrian Getaz—Yes, they do often.

E. France—Yes, very many of them.

Dr. J. P. H. Brown—Frequently they do.

P. H. Elwood—Yes, very often, in mild weather.

Eugene Seror—Occasionally, I think, but not often.

Mrs. J. M. Null—Undoubtedly, but not voluntarily so.

Chas. Dadant & Son—Yes, they often do, in warm weather.

O. O. Poppleton—Yes, especially during a heavy honey-flow.

J. A. Green—Not as a rule, and not intentionally in any case.

W. G. Larrabee—I have no positive proof of it, but I think they do.

J. M. Hambaugh—During warm weather and a good honey-flow they will.

R. L. Taylor—During the time of bass-wood bloom they do to some extent.

Emerson T. Abbott—According to my observation bees frequently remain out over night.

J. E. Pond—I never knew or heard of such an instance, and very much doubt if such a thing were possible.

A. F. Brown—No. It frequently does not take a bee over 6 to 8 minutes to fly from the hive and return with a load.

Dr. A. B. Mason—Yes, I have often noticed them on flowers in the morning before any bees were leaving their hives.

Dr. C. C. Miller—I have read that they sometimes stay out over night, especially when working on linden moonlight nights.

C. H. Dithern—Yes, very often, as they often get belated or are caught by showers, and in warm weather such bees will return to their hives early the next morning.

Prof. A. J. Cook—Yes, I have taken bees on flowers, too chilled by evening air to rejoin the hive. I think they found home, or would have done so the next day.

G. M. Doolittle—Did you have a lantern, or what? 'Tis "pitch dark" here on Sept. 21 at 4 o'clock a.m., and you could not see a bee, say nothing about its loads of pollen.

D. W. Heise—Yes, I have every reason to believe they often do, when caught by showers or storms. I could give instances which led me to this belief, but think it not necessary.

Mrs. A. J. Barber—Yes, I have shut up colonies after sunset, and even after dark, to be moved the next day, and would find bees on the screens at the entrances early the next morning.

R. C. Aikin—I guess not, unless as when trapt in a honey-house or elsewhere. If out it would not likely come loaded in the morning unless it got loaded before belated. They never stay out willingly.

G. W. Demaree—It is not the habit of the honey-bee to lodge in the fields at night. There are certain plants which the bees visit for the nectar they secrete, and which plants contain intoxicating qualities that stupefy and overcome the bees, and cause

MEDINA, OHIO.**

them to lose action and stay out over night. Some of them recover by morning, and some perish.

E. Whitcomb—Quite frequently when gathering honey or pollen from quite a distance, or when overtaken by a sudden storm, they seek the friendly protection on the under side of some leaf, and return home as soon as opportunity offers.

C. Davenport—I don't know. I have often seen bees come in from the field very early, but perhaps they wake up early, or were unable to sleep at all, and so went out earlier than the others. I have never seen any sleeping out in the fields at night, but it may be some prefer to lie out in the fresh air.

Rev. M. Mahin—It is very common for bees to stay out all night. After a rainy night I have often seen bedraggled and forlorn looking bees come in in the morning. If you shut a hive up in the evening, at a time when nectar is plenty, you will be surprised at the number of bees that will be clamoring for entrance in the early morning.

GENERAL ITEMS

Best Honey Crop in Three Years.

The honey crop in this county this year has been the best for three years. My crop of 3 600 pounds is all sold, mostly extracted, at 10 to 20 cents. I could have sold a ton more if I had had it. J. M. DODD, Douglas Co., Minn., Sept. 20.

The Bee-Smoker Man's Report

I am making a cellar to winter my bees. The season has been good for rearing bees, but no one seems to think it has been up to the average for honey. My 16 little 11th-of-May colonies have increased to 93, with honey enough to winter them, as far as honey will do that. Of course, my honey crop is not much, but after I decided not to increase them more, an effort was made to get a little section honey for family use, and I have 318 pounds of nice fall crop.

Last winter reduced the bees in this region more than one-half, and this winter will start in with less than 1/4 that last winter did. T. F. BINGHAM, Clare Co., Mich., Sept. 22.

Very Poor Year for Bees.

I should have been pleased to have been with you at the late bee-convention, but it was too far for me to attend. It has been a very poor year here for bees and honey. I have lost over one-half of my bees since spring came—some 40 odd colonies—and some of the balance are very weak. I don't know what the matter is with them. They fly out and drop down, and never rise again, but crawl around on the ground and die. Bees in this place are nearly all dead. Mine have plenty of honey. JOSHUA TERRY, Salt Lake Co., Utah, Sept. 17.

Honey an Entire Failure.

Honey is an entire failure in this vicinity this season. I'm afraid lots of the bees will starve the coming winter, but I was lucky enough to get enough winter stores for mine. JOHN H. RUPP, Washington Co., Kans., Sept. 15.

Probably Prairie Clover.

Will you kindly inform me what the name of the enclosed plant is. I enclose the entire top of one plant. It grows about two feet high, and bees are working on it in large numbers. It grows on land which

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 2 1/2 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now, and 1 1/2 miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

was cleared years ago and is partially grown up to brush again.

After a cold, wet, backward spring, white clover bloomed abundantly and bees did fairly well on it. It is now past, and the first crop of Alsike is also cut. Basswood seemed to yield some this year, but my bees were out of range of it, so they did not get the benefit. Our only hope now is in the golden rods, which are just now beginning to

"brighten, as with touch of gold.
The summer's waning splendor,
While every blossom seems to hold
A message sweet and tender,"

to the apiarist to be prepared to gather the harvest of rich, golden honey, which we hope they will yield in the sweet bye and bye."

JOHN ATKINSON.

Crow Wing Co., Minn., Aug. 4.

[The plant is probably prairie clover—*Kuhnistera purpurea* or *Petalostemon purpurea* of Gray's Botany. The absence of leaves makes its certain identification impossible. Yet, with little doubt it is the above. It extends from Manitoba to Texas, and west to the Rocky Mountains, but is not reported west of this range, so far as I can learn. I have never heard of its being a bee-plant before, but I should expect it to yield nectar, from its relatives.—A. J. Cook.]

Almost No Honey.

This is the first year that I got almost no honey. There was altogether too much rain, and always at the time of a honey-flow.

I send you a willowweed plant. If you are careful you can unwind the plant without breaking the connections. The plant is 12 feet 9 inches long.

HERMAN AHLERS.

Clatsop Co., Oreg., Sept. 17.

[The plant is received, and it is indeed a long sample. It unwound all right. Thank you.—EDITOR.]

Large vs. Small Hives.

There is one point in the article by Mr. Getaz on the above subject, on page 561, that he ignores. He allows prominence to the idea that a person who uses an 8-frame hive never allows the queen to occupy any more room than is provided by the eight frames, and in ignoring this expansion feature it looks as if he were trying to make a case for the large hive.

When the bees in an 8-frame hive come out strong in the spring, as they surely will if wintered right, it will transpire that in a short time the bees become so crowded for room that a super with brood-combs is added, the bees and the queen immediately taking possession, and a good queen, such as all bee-keepers should have, will soon fill

Our Great Trial Trip Offer!

3 months for only 20 cents,

WE want to add a lot of **NEW** subscribers to our list during the next two months, hence this **SPECIAL TRIAL OFFER.** It is 13 copies of the old American Bee Journal for 20 cents—about a cent and a half per copy. If **THREE** new trial trippers are sent together, they will be received for 50 cents. We would be pleased to have our friendly readers show this trial offer to their bee-keeping neighbors and acquaintances, and send us a few new subscribers. You will do both them and us a great favor.

The best part of the Philadelphia Convention Report will appear in those 13 numbers.

the 16 frames, at least when a 10 frame hive is used. I have had queens that would more than fill 16 frames, and as I understand the respective sizes of the large Dadant and the 10 frame Langstroth hive, the difference in comb surface is a little in favor of the latter, and as much brood can be cared for.

But to return to the 8 frame hive. What it lacks in the brood-frames can be more than made up in the addition of a third, or until there is an unlimited room the queen can occupy. Therefore, it is unnecessary to winter such enormous colonies in enormous hives.

Of course, Mr. Getaz's argument is all right as between the 80 colonies in the 12-comb hive and the 120 in the 8-comb, provided we hold them within those limits; but if we can make the 120 equal in the rearing of bees and the production of honey to 120 in the 12-frame hives, we gain in several points, ease in handling the hives, interchangeable frames, all frames can be used in an ordinary extractor, less stores in wintering, expansion or contraction practiced at will.

Yes, Mr. Getaz, give us a chance to expand, and we will make as good a showing as the large hive.

Los Angeles Co., Calif.

Poor Season for Bees.

The past was a poor season for bees in this part of Nebraska; indeed, the worst season for bees since I have kept them, and that is since 1891, when I started with one colony. Even that well remembered dry season of 1894 put this 1899 season in the shade all around, as to surplus honey. This year I got none, and the bees almost have nothing in their hives, and will have to be fed during winter and spring until new honey is coming in from the spring flowers of 1900, which I hope will give a big yield of surplus honey to make up what was lost in 1899, or what I did not get.

But all the same, the old American Bee Journal will have to visit me every week, if I live, and health permits.
H. HANSEN,
Sherman Co., Nebr., Sept. 20.

Very Sweet Honey.

While visiting in Michigan last August, I was entertained at Mr. Hobart Paine's, of Shiawassee County. For tea we had some very white comb honey. Mr. Paine produced it himself, and was sure it was from either white or Alsike clover. I am sure I never tasted of honey from flowers before that was so sweet. I should have said at once that it was produced from feeding

3 Cents Each for Names.

Send 10 cents and the names of 5 neighbors, who raise poultry, and we will send you our monthly 20-page paper for one year. Regular price, 25 cents a year. Sample copy free. Mention American Bee Journal when writing.

The Novelty Pocket-Knife

A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, **BEES AND HONEY.** We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

Carloads of Bee-Hives.....

Sections, Shipping-Cases, Comb Foundation

and EVERYTHING used in the bee-industry. We want the name and address of every bee-keeper in America. We supply dealers as well as consumers. Page & Lyon Mfg. Co.

NEW LONDON, WIS.,

Operates two Sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of... **Bee-Keepers' Supplies...**

They have also one of the **LARGEST FACTORIES** and the latest and most improved machinery for the manufacture of **Bee-Hives, Sections, &c.**, that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the **clearest and whitest Basswood** is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the **BEST GOODS AT THE LOWEST PRICES.**

Send for Circular and see the prices on a full line of Supplies.

 **Don't fail to mention the Bee Journal when writing advertisers.**

granulated sugar. This was what interested me. I presume that the bees gathered it very rapidly, so that the transformation into glucose or levulose was not complete, or as complete as usual. Thus there was more of the sweeter cane-sugar than in the usual honey. This was also the reason why the peculiar honey-flow was so little to be detected. A large tableful of people all noticed the sweet character of the honey, and the very delicate flavor. I have tasted honey made from cane-syrup which was not as sweet, and was more characterized by the usual honey-flavor than was this.

The past week I have been away up to Julian, 38 miles from a railroad. This is in San Diego County, and is in a very fine honey region. The honey crop has been small, but good, and the bees are now in fine condition. **A. J. Cook.**

Los Angeles Co., Calif., Sept. 20.

Is Christianity Practical in Worldly Affairs?

Rev. Charles M. Sheldon, author of "In His Steps," one of the most widely read books in the English language, has written an article which establishes the practicality of the teachings of Christianity as set forth in his book which have been put to the test in innumerable religious bodies the world over. Mr. Sheldon declined to write for publication anything relating to his individual work in applying his teachings of "In His Steps," until others were convinced that those teachings were applicable to every-day affairs. He has now taken up his pen and shown that the question, "What Would Christ Do?" may be answered by every Christian, and the precept followed. "Is Christianity Practical in Worldly Affairs?" will be published in the November Ladies' Home Journal.

Convention Notice.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held at the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 17 and 18, 1899. All are cordially invited. **B. KENNEDY, Sec.**
New Milford, Ill.

A New Feed Grinder.—The Electric Wheel Company, whose several lines of goods are familiar to our readers, are out this season with a new feed grinder. Their card appears on another page. Any who intend buying a feed grinder will please write The Electric Wheel Company, Quincy, Ill., for special catalog, and mention the American Bee Journal.

A Famous Dehorning Knife.—The advertisement of A. C. Brosius, of Cochraville, Pa., makes its first appearance in this issue of our paper for the new season's business. Our readers will remember this gentleman as being the manufacturer of the now famous Dehorning Knife which has been of such great value to stockmen everywhere. This is the dehorner which took highest award at the World's Fair. It differs from all other devices of its class in the fact that it cuts evenly from four sides at once. This prevents all bruising and crushing of the horn and constitutes the most humane way of removing the horns. Then, too, it is a quick and safe way for both man and animal. Write Mr. Brosius for circulars, prices, etc., saying you saw his advertisement in the American Bee Journal.

 **BEE-HIVES, SECTIONS, SHIPPING-CASES**—everything used by bee-keepers. Orders filled promptly. Send for Catalog. **Minnesota Bee-Keepers' Supply Mfg. Co., Nicollet Island, Minneapolis, Minn. 18ATf**

IF YOU WANT THE BEE-BOOK

That covers the whole Apicultural Field more completely than any other published, send \$1.25 to Prof. A. J. Cook, Claremont, Calif., for his

Bee-Keepers' Guide.

Liberal Discounts to the Trade.

The Bee-Keeper's Guide

Or, Manual of the Apiary,
—BY—
PROF. A. J. COOK.

460 Pages 16th 1899 Edition 18th Thousand \$1 25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book, 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey," 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode German, by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condense treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tucker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 29.—Fancy white comb honey brings 15c; No. 1, 13@14c; ambers, 10@12c; dark, 9@10c. Extracted, white, in cans, 7½@8c; in barrels, 7@7½c; amber, 6½@7c. Beeswax, 20c.

The receipts are increasing and sales are becoming more frequent. Shipments are coming to hand in good order, and when properly prepared will do so until we get zero weather, after which it is liable to crack, and break away from the frames. R. A. BURNETT & CO.

KANSAS CITY, Sept. 14.—The supply of comb honey is very light. Scarcely any extracted on the market. We quote fancy 1-pound comb 14@15c; No. 1, 13@14c; No. 1 amber, 12@13c. Extracted, white, 7c; amber, 5@6c; dark, 4@5c. Beeswax, 22@25c. C. C. CLEMONS & CO.

NEW YORK, Sept. 20.—Fancy white, 15c; No. 1, white, 13@14c; fancy amber, 11@12c; No. 1, amber, 10@11c; buckwheat, 9@10c. Beeswax dull at 25@26c.

Demand good for all kinds of comb honey, and ready sale. Extracted in good demand also, excepting buckwheat, at unchanged prices. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 25.—White comb, 11½@12½c; amber, 8@10c. Extracted, white, 7½@7¾c; light amber, 6½@7c. Beeswax, 26@27c.

The market remains unfavorable to the buying interest, and is likely to so continue throughout the season, with supplies of very moderate volume, not only here, but also in the interior.

CLEVELAND, Aug. 18.—New honey scarce and in good demand. Fancy white, 15c; No. 1 white, 13@14c; fancy amber, 12c; No. 1 amber, 10@11c. A. B. WILLIAMS & CO.

ALBANY, Sept. 26.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c. MACDOUGAL & CO.

Successors to Chas. McCulloch & Co.

BOSTON, Sept. 21.—Fancy white comb, 1-pound sections, 10c; A No. 1, 14@15c; No. 1, 13@13½c; No. 2, 11@12c. White amber extracted, 8@8½c. Beeswax, 27c.

New comb honey is coming in very slowly, showing a general shortage all over the country. BLAKE, SCOTT & LEE.

BUFFALO, Sept. 29.—There are virtually no arrivals of strictly fancy white comb honey. The very little arriving is poor, and the best of it brings 14 cents. We believe extra fancy would bring 15@16 cents, and any grade will sell well here. It receipts do not increase we may reasonably look for possibly higher prices. There is a very strong demand, quickly taking the few arrivals. BATTERSON & CO.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14@15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow sale at 7@7½c. PEYCKE BROS.

DETROIT, Sept. 11.—Honey-producers accustomed to selling in Detroit have hard work to satisfy local trade. Very little honey in market. White comb, 14@15c; dark, 12@13c. White extracted, 7½@8c. No dark wanted. Beeswax, 23@25c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

R. A. BURNETT & CO.,
33A1St 163 So. Water St., Chicago, Ill.

WANTED. Fancy white comb honey in no-drip shipping-cases. State price, kind and quantity. C. H. W. WEBER.

39th YEAR.

CHICAGO, ILL., OCTOBER 12, 1899.

No. 41.

CONTRIBUTED ARTICLES

Apiary of Mr. S. T. Pettit, of Ontario, Canada.

BY A REPORTER FOR THE FARMER'S ADVOCATE.

THE illustration on this page represents Mr. S. T. Pettit's bee-yard, in Elgin county, Ont., as it appeared on Aug. 9, the day of our visit. The hives are not all shown, as the camera could not be situated so as to take in the whole yard to good advantage. Enough is shown, however, to indicate the general order of the yard, the honey-house and the work-shop where hives, supplies, etc., are

swarms per colony this year than in any year since 1895, which is accounted for by the unfavorable weather, especially during the clover bloom.

His entire honey crop from the 80 colonies, spring count, is about 5,000 pounds, 800 of which is comb honey. As there has been no honey coming in since the middle of July, the chances are the colonies will all require to be fed before winter. As will be noticed, the hives appear with extracting-supers, which are divided from the brood-chamber with queen-bars or queen-excluders.

The building to the right in the background is the honey-house, where extracting, etc., is done, and honey is stored until shipt. The other building is a work-shop, where Mr. Pettit makes all his hives and parts. Beneath this building is a stone cellar, where the bees are wintered. It is kept dark, well ventilated, and at a uniform temperature. The ventilating system is of Mr. Pettit's own invention, and is very unique. At the center of the end of the building facing the bee-yard is an outside stairway leading to the cellar-door. The door fits tightly, but has a number

Apiary of Mr. S. T. Pettit, of Elgin Co., Ont., Canada. (From the Farmer's Advocate.)

made. In round numbers the yard contains 100 colonies, being an increase of 20 since they were brought out of the cellar in spring.

Mr. Pettit makes a specialty of comb honey, and his bee-yard would look more natural showing the hives with comb-honey supers, but these were all removed at the end of the honey-flow about the middle of July. In fact, comparatively little comb honey was produced this season, owing to the paucity of new swarms, which Mr. Pettit uses for comb-honey production. Mr. Pettit received less new

of 2-inch holes covered with wire-screen. Covering the stairs on a level with the ground is a pair of doors which lie flat when closed, and it is thru one of these that the ventilator is placed. It consists of an 8x8 inch square box 20 inches long. This fits perpendicularly in the door, and has a slide passing thru it, which can be opened or closed, as appears necessary by the temperature of the cellar. The top end is covered with wire-screen. Now, in order to exclude the light, an inverted box rests loosely on the top, and at the bottom end a similar box hangs bottom down. Both

boxes are about three inches larger than the ventilator, which they telescope about two inches each. A similar ventilator is provided for each of the two windows, so that a free circulation of air is admitted without the possibility of light entering the cellar. The temperature of the cellar is held at from 40 to 42 degrees, which prevents breeding, and holds the consumption of honey down to a minimum, and at the same time retains the vitality of the bees to the greatest possible degree.

The yard was to remain as it appears in the engraving until about Sept. 20, when the extracting-supers are to be removed, the hives weighed, and the bees fed where necessary. Each hive should contain about 30 pounds to commence the winter. About Nov. 17 the bees will be transferred to the cellar, where they will remain till the time arrives to set them out in the spring.

We would draw attention to the proprietor of the apiary sitting in the shade of the tree in the foreground. He is wearing his bee-veil attached to the rim of a straw hat, drawn tightly from the rim and tucked under his braces and drawn tightly across the breast, which holds the veil away from the face and neck, thus making a sting in those regions impossible. After the photograph was taken, Mr. Pettit recognized that his trouser legs should have been tucked inside his socks, that he would appear like a bee-keeper at his work. When the trousers are thus tucked in the bees cannot walk up inside to create trouble for themselves and the individual wearing the trousers. We would also point out the solar wax-extractor sitting in the foreground, near the clump of flowering shrub. It is set on a pivot, on which it can be revolved to face the sun throughout the day.

A COMB-HONEY HIVE AND ITS ARRANGEMENT.

By following the description of Mr. Pettit's hive, some important points in his system of comb-honey production will be understood.

1 represents the cover, beneath which is a cushion 2 inches thick, of soft, fine hay, and beneath this is a cotton-cloth, of hard, white cotton-duck, which rests on the sections.

2-2 are section supers, one-quarter inch deeper than the sections used. Mr. Pettit's are 17 $\frac{1}{2}$ inches square, inside measurement, each holding 36 sections.

3, queen bar or excluder, which covers the brood-chamber, admitting only worker-bees to the supers.

4, brood-chamber.

5, wedges of wood one inch deep in front, gradually tapering to a point at the back. These are used in summer

Pettit Comb-Honey Hive and Arrangement.

to allow ventilation, and they also raise the front of the hive so as to induce the bees to go up the side-walls of the hive and the brood-combs near the back of the hive.

6, floor projects 3 $\frac{1}{2}$ inches in front of the brood-chamber.

7-7, stand of two 6-inch boards and two 7-inch. This rests on bricks, as shown.

8, comb-honey supers, same as 2.

9-9, divider set on two of the sides of the super, as shown in position. It is $\frac{1}{8}$ -inch thick, and has $\frac{1}{8}$ -inch holes, thru which the bees pass to the sections.

10, section in position, resting on T tins 12, and against a divider. The section is filled with light foundation of good quality, within 3/16 inch of the bottom. With sec-

tions fitted with foundation in this way the bees fill them evenly.

11, bee-space of 5/16 inch, created by six blocks numbered 13 on divider number 9. The advantage of this extra bee-space at the sides of the super is to allow for a double quantity of bees to keep up necessary animal heat, which is advantageous to the finishing up and capping the combs in the sections.

The Indoor Wintering of Bees.

BY C. P. DADANT.

PLEASE allow a stranger to ask your opinion or advice in relation to a wintering place or house for my bees. I have in mind to build a house with double walls, 6, 8 or 10 inches between the outside siding and inside ceiling, and fill the space with dry sawdust, have a double floor filled in the same way. Seven feet between lower and upper floors. I can carpet or cover the upper floor with sawdust. I will be very glad to have your opinion in the matter. Also, how much space does it require to place 75 to 100 hives with bees, and the best and most proper way to ventilate the room? Any suggestions will be thankfully received.

Yours truly,

R. R. JACKSON, Allamakee Co., Iowa.

We have often heard of bee-houses being used similar to the one mentioned in the above enquiry, but have never seen or tried them ourselves. Any repository in which the bees may be kept at an even temperature slightly above the freezing-point may be considered as a safe place to keep bees over winter if the place is also dry and quiet, tho the latter consideration is of less importance, as it is evident that bees do get used to noise and the trepidation which is common in noisy sports.

The question of proper temperature is by far the most important in this connection. It often happens that misinformed people try to winter their bees in empty rooms where the changes of temperature, altho less sudden and extreme than out-of-doors, are still quite great. These attempts have almost invariably proven failures. This is very easily explained. When the temperature is low, say below the freezing-point, the bees have to consume a quantity of honey proportionate to the rigor of the weather, in order to keep up the bodily heat, which, in a healthy colony should never get below the temperature of the blood. This consumption of stores necessarily causes their bowels to become more or less distended with fecal matter according to the quality of the food—less if the food be of best quality, more if of dark honey or honey loaded with pollen.

In a natural outdoor wintering the bees will, at the first warm day, have the necessary opportunity to unload their bowels, but if they are confined in a room they will become restless and will suffer, and eventually die. On the other hand, in the same repository, when the temperature is higher than necessary, they feel the natural instinct to take flight and also become restless. They often try to rear brood, and this adds the necessity of securing water, which adds to their discomfort when in confinement.

If one had but two or three colonies and plenty of leisure, and was so interested in the bees that he would be sure not to forget them, they might be confined in any dark room, so it was sufficiently sheltered, and take them out on warm days. This would of course be much better than outdoor wintering, but it is not possible with a large number of colonies, owing to the work it would entail, and the fact that some winter days are warm for a few short hours only, so the colonies that were taken out last, out of a lot of 75, might not have a fair opportunity to take flight.

In years past we were in the habit of wintering two of our apiaries indoors; in our home we have a portion of our cellar partitioned off from the main part purposely for the bees. We have not used it of late because the winters have not proven injurious. When our bees were in the cellar, my father, who has a great taste for experiments, used to go to the bees several times in the week, and at different hours, to ascertain their condition. He invariably found that they were quiet at a temperature between 40 and 45 degrees, Fahr. Below this point they would show by their hum that a little warmth was needed. Above it they were also restless, and an occasional bee would stray out of its hive and fly up to the light brought in.

I remember that an old York State bee-keeper had publicly stated that the bees could stand a very high temperature when in the cellar, provided the moisture in the air of the cellar was adequate to the rise in temperature. This he so strenuously maintained in public arguments that I took pains to interview him at a convention, and found out, to my great surprise, that he had no thermometer in his cellar, and was only "guessing" at the temperature mentioned by him.

A thermometer costs but a trifle— from 25 to 40 cents—

and I strongly urge all who wish to winter their bees in a repository to place one of these instruments in the room.

It matters but little whether the room used is above or below the surface of the ground, if the temperature may be retained at the point I have mentioned. But it seems to me much more difficult to retain sufficient heat for the purpose in a room above ground, even in a repository lined with sawdust in a climate like that of northern Iowa. In a very hard winter, unless the room contains enough bees to keep up the heat inside, we all know that the cold will, after awhile, penetrate a very thick lining of non-conducting material. How nearly the temperature may be kept to the proper degree cannot be assured except by such as have tried it.

But to my mind, in a hilly country, it would be cheaper and much safer to make the repository partly, if not altogether, in the ground. The natural temperature of cellars is higher than that required by the bees, and it is much easier to bring in cold air than warm air, unless we fuss with a stove, which would lead to trouble without end. So very probably a cellar would be best.

I have in mind a cave owned by Mr. Parent, of Benton Co., Minn., which seems to me to be about as cheap a building as may be had. I understand that in those cold regions there is but little to fear from dampness during the winter, because the ground being frozen to a great depth there is no possible chance for surface water to infiltrate. Thus they are perfectly safe from a danger against which we must carefully guard in our latitude.

The cave is dug in a gentle slope, closed with a double door, with a good bed of straw between the doors. Its walls and roof are entirely of ground boarded up, and the beehouse is placed above it. This kind of a repository is certainly better than a house-cellar, which is often enough out of the ground to become very cold, and in which one places all sorts of vegetables that are apt to more or less vitiate the air. The bee-cave is made only for the bees, and they are there in perfect quiet.

In another article I will consider the questions of ventilation, of the space required, and of the time most suitable for the removal of the bees to the repository.

Hancock Co., Ill.

Density of Nectar in Flower-Cups.

BY A. NORTON.

IN my first remarks upon this subject I did not mention Mr. A. J. Bates by name, partly to avoid offense by antagonizing him personally. And I would not further mention the subject, or him personally, but that his reply on pages 515-16 contains so many mistakes, as it seems to my humble judgment, and that he has brought out the personal feature so as to make it no object to avoid it.

If Mr. Bates will permit me I will call his attention, in a fraternal spirit, to some errors of statement of his in said reply. His first statement I do not really grasp as to whether he deals with ripe honey absorbing moisture in the comb or with thin honey parting with moisture, the thin part being drawn to the mouth of the cell. I think he overlooks the fact that (whichever way he means) the honey would never ripen or become entirely thin if the thinner parts did not take from that which is thicker. And the rapidity of the ripening of honey comes from the great readiness with which this is done.

The thick honey in the cell would stay thick with a thin surface, or the thin honey would remain thin with a thick surface (not being at the top exactly, but on one side, from its position in the comb), but that, as soon as one part becomes different from the rest, the thicker part is quickly made into the same consistency as that of the thinner part by the absorption of part of its sweetness.

Mr. Bates is mistaken in his second statement, for the earth and most objects upon it give off heat faster than does the air. Hence the air, where it comes in contact with cooler objects than itself, has its vapor condensed into dew. Dew would never form by contact of air with objects warmer than itself, as he states on page 516. From my remembrance of the structure of red clover blossoms with their slender, partly-closed tubes, the dew would not form within them, since dew does not "fall," as so many use the term; and it would probably not get into the nectaries unless it formed so plentifully over the heads as to flow over into the tubes of the flowers. Rain might beat in and wash the nectar out; but that is a different consideration.

I think the reason why the Italians work more freely on the red clover in the morning is that the flowers have

been secreting nectar all night with nothing to deplete it, while the morning's work leaves the flowers more or less destitute, so that bees forsake them. If any outside moisture happens to have gotten into the flowers, it will have taken up the *same kind* of sweetening as that they hold, and will doubtless be of the same *thickness* as the rest of the contents. Even before it has become equally thick, it is equally good, needing only more evaporation, and involving difference of *quantity*, not *quality*.

Soon after reading Mr. Bates' reply, I took a small drop of honey to represent specially thick nectar, a small bit of candied honey to represent still more fully evaporated nectar, and a little sugar to represent that entirely dried down. Upon these separately I placed small drops of water no larger than the amounts of sweetening, just laying the water carefully on top with no stirring. In a less time than dew remains on flowers after it forms, these were all of evenly uniform density, with no layers that were to be detected by examination. Should thin nectar dry gradually, it would thicken uniformly unless the waxy nature of the thick product should cause a thick film to adhere at the sides or edges, and thus be held at the top instead of on the bottom of the thinner portion.

Regarding Mr. Bates' last statement, I will only say that I have made mortar in my day and am familiar with it, and that it is not lime in a state of *suspension* in water, but water in a state of *absorption* in lime, and that it has no illustrative bearing on the subject.

I don't wish to make this subject seem too important and so I will imitate Mr. Beyins by crawling back into my hole; and I promise not to speak up again, and to cheerfully give Mr. Bates, "Cogitator," or both, the right to have the last word if they desire it.

Monterey Co., Calif.

[We think this subject has been sufficiently exhausted now, so we let the above conclude the discussion.—EDITOR.]

The Dzierzon Non-Sperm Theory a Fallacy.

BY C. THEILMANN.

IN "Beedom Boiled Down," on page 538, we find the following: "The Dzierzon theory, says Deutsche Illustrierte Bienenzeitung, so far stands as solid as a rock, and it will require more proofs than have yet been brought against it, to budge it in the least."

This will probably be the last kick the Dzierzon non-sperm in drone-eggs will make, as many bee-keepers will (according to Mr. Hasty's afterthought, on page 566) try the experiments set forth by Prof. Dickel, and the formula recommended by myself. All who will try it will most surely be "comrades," as Mr. Hasty suggests.

For myself, with the experiments I had in 1883 with a swarm, and again with five swarms the past July, I have gained indisputable facts of the fallacy of the Dzierzon theory. My formula is so simple and easily performed (see page 500) that almost any bee-keeper can try it and satisfy himself of its correctness, that bees can and will produce either sex from eggs laid in worker-cells by a normal queen.

I will give the readers of the American Bee Journal the experiments I made the past summer with five swarms, to make sure of what I experienced heretofore.

On July 9 I prepared two swarms for stock colonies, with starters in frames. July 11 a frame of the above was taken and given to a swarm just issued and made queenless, and put on the old stand after the old hive was removed where they came from. The frame was partly stocked with eggs in worker cells. The same evening the hive was removed to another stand, but the bees made a big commotion on account of dissatisfaction, and some deserted the hive, but when put back to their old stand they quieted down and seemed to be satisfied.

On examination, on the 19th, the frame was destitute of eggs or larvæ, and another frame with eggs was given immediately; on July 24 four queen-cells and two drones in worker-cells were nearly completed, also about 300 workers. On this day laying-workers had already started laying—I counted nine eggs in a newly-started queen-cell.

No. 2 swarmed July 11, and was treated the same, with a frame of worker-cells stocked with eggs; examined on the 24th there were found nine queens, ten drones, and two worker-cells, all capt. This swarm also changed stands like the first.

No. 3 swarmed July 13, and treated the same as No. 2.

I found 14 queens, 6 drones, and 300 to 400 worker-cells, all capt on the 24th.

No. 4 swarmed July 13; a frame of all-worker-cells with eggs was given, and on the 24th I found 22 queens, 20 drones, and probably 2,500 worker-pupae all sealed and capt.

No. 5 swarmed July 14, and was treated as those above, and I found 28 queens, 10 drones, and 800 to 900 worker-pupae, all capt on the 24th. There were no drone-cells on any of the frames that were given to the swarms.

I would say here that the caged queen should be taken from the swarm as soon as all the bees have come back to their old stand and new hive. The hive should not be moved to another stand, as you will notice by my experiments of swarms Nos. 1 and 2. None except the first had any laying-workers before they had laying-queens.

I photographed a frame from No. 4, 11 days after it was given to the swarm. I had to take it 10 miles on a very rough road, and it was broken from the frame and somewhat mutilated. We could get only the view of one side. After I got home I gave it to the swarm again, but it took from two to four days longer than the usual time for the young bees to hatch out.

I send the photograph to the editor of the American Bee Journal, and hope he will publish it. I also hope that many bee-keepers will try the experiment next year, and be convinced.

Wabasha Co., Minn.

Introducing Queens—More Explicit Directions.

BY EDWIN BEVINS.

I HAVE received the following letter asking for more information about my method of introducing queens:

On page 547, Mr. Edwin Bevins tells how to introduce queens. Now he of course means well, intending to assist the beginner, but how does he presume a greenhorn will proceed under his directions? He does not say where to put the queen.

Two neighbors of mine are trying his method; one has put the queen alone in the cage between the two hives, and one has placed her with her retinue on the comb above the cage. Will Mr. Bevins please tell us thru the American Bee Journal just how he does it? H. M. JAMESON, Riverside Co., Calif.

No wonder Mr. Jameson asks for more light. I was very much surprised and chagrined at the way the method appeared in print on page 547 of the American Bee Journal. I intended to send a correction sooner, but was prevented by an illness that took me away to a health resort. Whether I omitted to write fully, or whether the editor omitted to print as I wrote, I am unable to say. Anyhow, I will give the method as I have practiced it, and always with success. [We printed it exactly as Mr. Bevins had written.—EDITOR.]

When I have a queenless colony, and the weather is warm enough so that hatching brood in an upper story will not be chilled, I send for a queen, and when she arrives I hunt for two frames having hatching brood and some honey. These frames I place over the queenless bees in an upper story above the frame of wire-cloth. The frames are put close to one side of the hive. Then I put the cover on so as to be over the frames and yet leave a space open on the opposite side of the hive large enough to admit my hands. Then I remove the tacks that hold the wire covering to the cage at the end opposite the candy, and with the thumb of the left hand I hold the wire-cloth of the cage in place until I can place the cage right down on the wire-cloth of the frame close to the lower edge of one of the frames of brood. Then with the fingers of the right hand I turn up the loosened end of the cage-cover, and the queen

and accompanying bees will climb right up on to the combs. Then I put the hive-cover in place and go about my business.

If bees are hatching rapidly I do not leave the frame of wire-cloth between the two hives more than from 24 to 48 hours. If there should not be a goodly number of bees hatcht in that time I would leave it longer as a matter of precaution, altho I by no means regard it as a necessity.

Any one can easily see that the above is only a roomy way of caging the queen so near the bees she is intended to serve that when they are admitted to her presence she is regarded as one of the family. The presence of the just-hatcht bees and the remaining brood and the honey help to heighten the illusion, if illusion it is.

It may not be necessary, but I will say further that the frame between the two hives should have wire-cloth nailed to both sides of it, and that there should be no opening thru which a bee can by any possibility get below, or get outside, until re-least by the removal of the frame. Decatur Co., Iowa.

CONVENTION PROCEEDINGS

Report of the Central Texas Bee-Keepers' Convention, Held at Milano, July 20-21, 1899.

BY LOUIS SCHOLL, SEC.

[Continued from page 636.]

UNITING AND DIVIDING COLONIES.

When H. H. Hyde unites colonies, he destroys the queen of one colony two days previous, then puts most of the brood in the lower chamber of one, and sets the other body on top, using tobacco-smoke on the bees. In dividing he buys new queens, but prefers to rear them for the new division; he divides equally and removes the half with the old queen to a new location.

Judge Terral does not look for the queen, but divides equally and puts one in a new location.

WORKING UP A HOME MARKET FOR HONEY.

O. P. Hyde did not have much experience, as he ships most of his honey. He peddled some around put up in Mason jars.

Judge Terral peddles it around, and lets people know he has honey to sell. They know him as the "bee-man." He advises working up a reputation and teaching and educating the people about honey. He does not advise to sell a large quantity to a family at one time, as they generally eat too much at first and then tire of honey. He said to put it up in small packages was expensive. He weighs it out into the buyer's bucket.

Mr. Guess has also had trouble by selling too much at a time, even 50 pounds at once; while Messrs. Jones, Hyde, Davidson and others accommodate their customers with as much as they ask for. They have sold a whole barrel to a family at a time, and had no trouble. People know what honey is, and buy some from them every year.

Mr. Aten ships honey by the carload to Northern markets. He has drummers along the road who sell by sample.

STARTING IN THE BEE-BUSINESS.

Mr. Salyer advises beginners to start on a small scale with few colonies, study their habits, and read the best literature. Visit and stay with a practical apiarist, also attend bee-keepers' conventions. One year he fed his bees early to stimulate brood-rearing, and stopt in April; he lost 30 colonies by starvation, as he reared bees out of season. He used to put new supers above the full ones instead of under, when giving bees more room, and other such like things.

A good many discust this subject. Some advised to stay with a practical apiarist first, while others advised studying bee-books and papers first. After a long discussion, and hearing the opinions of each, it was at last decided that it

was best to combine all practice, staying with practical apiarist, and reading books and papers.

BEE-KEEPING COMPARED WITH OTHER PURSUITS.

"Is bee-keeping more profitable in comparison with other pursuits?"

Mr. Salyer said there was more money in bees for the capital invested, altho he could make money at other pursuits.

O. P. Hyde gave some of his experience. He made more money out of bees. He bought a lot of bees for \$175, and received \$700 worth of honey from that lot the first year, besides 50 colonies of increase.

Judge Terral said it was not advisable for beginners to invest much in bees at once, but best for them to start with very few colonies, and start cheaply by beginning with swarms or bee-trees.

Mr. Davenport and others prefer to have other pursuits combined with bee-keeping.

Pres. Jones says that it will pay an experienced person to buy up several hundred colonies at once, but with the inexperienced it will not do.

BEST WAY TO REAR QUEENS.

"What is the most profitable way to rear queens?"

Mr. Davidson has reared queens by many methods, and has made failures. He uses a modification of Alley's method, which is different from Doolittle's, with which he did not succeed. Place an empty comb in the breeder's hive, and in 3½ days eggs will be hatch into larvae. Then deprive one or two colonies of their queens and brood. Don't leave any brood, and make nuclei with the queens. Leave these colonies queenless over night, and early the next morning get the comb with larvae, cut it into strips of one row of cells, destroy every other larva, then dip the other side into melted beeswax, and attach it to the bottom edge of the comb which has been cut out to give it a rounding bottom. After leaving the cells in these hives for 24 hours, remove them to the top story of strong colonies, with a comb of unsealed brood on each side, which brings up nurse-bees to complete the cells. Make nuclei a day before the cells hatch, and move the cells into strong nuclei when ready. Close the entrance or the bees will go back. He believes dipping cells is all nonsense, and will cause two failures to his one.

H. H. Hyde askt, Why not give two batches of cells?

Mr. Davidson—The royal jelly will be exhausted.

Mr. Davenport waits for colonies to start cells, then removes the larvae, and puts in larvae from his breeder.

Mr. Atchley says their plans of rearing cells is all right. He spoke on the Doolittle and Alley plans, also other methods, and cautioned queen-breeders not to go too far, and not to tear their colonies all to pieces making nuclei out of them, as that is dangerous. Have only one nucleus to each colony. Always have plenty of strong colonies to back you, or you will soon be ruined, so don't make this mistake.

Judge Terral and Pres. Jones endorse strongly what Mr. Atchley said. A queen-breeder has just so far to go, and if he leans over just a little when the demand exceeds his supply, he will generally proceed too far, and is sure to go down. Mr. Atchley is right about having large colonies to back you; have only one nucleus to each, and if you get a dollar out of it, it is just as good as found, as the strong colony is still there tending to its business. This venturing too far has ruined many a queen-breeder, as by tearing his whole apiary to pieces he was left without any bees and no strong colonies to back him.

Mr. Davidson also spoke on this, and before venturing too far he returned the money if unable to fill the orders.

Mr. Atchley objects to both going too far or returning the money. Have plenty of colonies to back you.

SECOND DAY—AFTERNOON SESSION.

BEST WAY TO REAR BEST QUEENS.

Mr. Atchley gets good queens out of cells from natural-swarm cells as any other method. Select all the good cells, and destroy all bad ones. Large colonies are not really necessary to rear good queens. He reared some of his best queens in a little after-swarm. Always attend closely to business.

Pres. Jones prefers a strong colony in a cool spring, also later in the season, as it can use a larger lot of cells. Strong colonies are always essential, and none too good at any time. Select good cells. He tried almost all methods to rear queens, and prefers Doolittle's cups, also Pridgen's

method of rearing good queens. Have colonies in good condition with bees of the right age, and plenty of nurse-bees. Budded cell-cups in the upper story of a strong colony with moderate or good honey-flow gave good results. He has had queens mated and laying in upper stories without running down his old colonies. It is a hard matter to have cells built in upper stories when conditions are not right, and no honey coming in. He can tell bad and defective cells on the third day, and selects his cells for good queens.

BUYING GOOD QUEENS.

"Can the honey-producer afford to buy good queens rather than use the ordinary or poor ones he may have?"

It was agreed upon by nearly all to buy good queens if the bee-keeper has no means to rear good ones. He will be greatly the looser if keeping poor queens, and can't afford to tolerate them.

The following resolution was read and adopted:

Resolved, That we, the Central Texas Bee-Keepers' Association, in session assembled, do hereby extend Mr. and Mrs. E. R. Jones, and the good people of the city, our sincere and heartfelt thanks for the hospitable way they have entertained us during our stay in their city; and that this resolution be incorporated in our minutes.

COLOR OF HONEY AND COLOR OF COMB.

"Does the color of the honey gathered have anything to do with the color of the comb?"

All said yes.

Pres. Jones related a case of last spring when bees gathered the darkest kind of honey, almost black, and yet the comb was very white. It was honey-dew.

Mr. Aten said it was not honey, then. It was "bug-juice," and the bees did not make the white comb from it.

"Is it a fact that queens reared from older larvae will hatch later than queens from one-day-old larvae?" They hatch first before the time of hatching good queens.

PREVENTION OF SWARMING.

"What is the best method to prevent swarming?"

Provide plenty of room; give third and fourth super if necessary. Can't prevent swarming after the bees get the swarming-fever.

Mr. Brown said: Room, shade, and ventilation.

Pres. Jones runs more closely for comb honey, which taught him that plenty of room for the queen and also in supers is best. Use a young queen; no other when producing comb honey.

BEEES FOLLOWING THE APIARIST AROUND.

"How can you find colonies of bees whose workers follow one around in the apiary?"

H. H. Hyde watcht the kind of workers and found their colony, dequeenit, and the trouble stopt.

Mr. Aten and others kill them, as they are only a few bees from certain colonies.

BROOD-NEST BEFORE THE HONEY-FLOW.

"How would you prepare the brood-nest just previous to honey-flow for extracted honey in Jamaica?"

Mr. Aten has prolific queens; lets them lay in all stories to have lots of hatching bees just previous to the flow, and the bees fill all cells with honey in upper stories, out of which the young bees hatch.

O. P. Hyde Strong colonies and good, prolific queens. Study your locality and know just when the flow starts. Have plenty of hatching bees just before the flow, and let the queen use all the stories. No queen-excluders. Bees fill every cell in the upper stories as soon as the bees hatch out, and crowd the queen down.

Mr. Atchley endorses the above plans. Plenty of empty combs on hand is as good as money in the bank.

SWEET CLOVER ITS VALUE, ETC.

A question was askt in regard to sweet clover, its value, etc.

Mr. Davenport gave quite a lengthy talk on this subject. Sow in the fall, in September, on unbroken ground. It grows and sprouts out well. Next September sow another seeding on same ground, to give a good stand. It has a tall growth, and stock like it. It requires about 15 pounds at each seeding; on good land about 10 pounds. It blooms very profusely, and a good honey-flow from it lasts from May 10 until frost. It is easily killed out by plowing. After being cut it runs out suckers and blooms again until

fall. It has somewhat peculiar roots of a knotty character, resembling—well the following will explain itself:

One day Mr. Davenport happened to see some travelers stopping near his sweet clover field, and a man digging at some of the bunches. On turning around he said, "They are very deep."

Mr. Davenport was surprised, and so he asked, "What?"

"Why those goober-peas," was the reply.

So it will be seen that, as that man was from Georgia where he knew all about 'em, sweet clover roots resembled his peas.

This being the last subject on the program the convention adjourned to meet next year at Hutto, Williamson county.

The apiarian exhibit in connection with the meeting comprised some very useful implements, and fine samples of honey and wax.

The list showed 3,524 colonies represented by the members present.
LOUIS SCHOLL, Sec.-Treas.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Carrying Out Dead Bees.

What ails my bees? About a month ago I noticed bees carrying out what look like white wings. Now early in the morning I notice, from six hives, the bees carrying out white dead bees, and even some small live ones with a sort of white film about the body. OHIO.

ANSWER.—It may be that all the young bees carried out are those that have been damaged by worms, and it may be that part of them are young drones in the larval state that the bees are carrying out because the honey-flow has ceased. There is nothing alarming in either case, and the thing to do in order to avoid trouble with worms in the future is to keep your bees strong and of Italian blood.

Perhaps Only the Poor Season.

I have three colonies this season. I had four last season, but lost all but one, and I moved it home about 1/2 mile. It was in a cracker-box. Last fall I took the top box off and got 75 pounds of honey; in place of the box I put on top one-half of a painted hive I made, and this spring they went into it and made four combs nearly the full length, and worked till the first swarm issued. They then left the top and did nothing since, and the other two swarms seemed to fill the bottom of the hive with comb, but don't work in the top. I uncovered the cracker-box to-day, and I find no honey in the cells nor capt. They seem to be starving and working.

Now what is the matter with them? There is a bad odor. In July I noticed many young bees carried out of the hive not fully formed. I sometimes think they have foul brood. Is there nothing that will kill the disease except removing into new hives? I thought probably they left the top because I looked at them once or twice a week. I dislike moving them so late. I have looked the journals over, and read all articles on foul brood. IOWA.

ANSWER.—Very likely there is nothing at all the matter except that the season has been poor and the bees have not gathered enough to fill up with. In the first place, the original colony began working all right in the upper story. Then the two swarms depleted it so much that there were not bees enough to store above, and the work there was stopt. The two swarms have probably been working away the best they could, but the season has been probably poor, as it has also been in most localities, and it is asking too much in a poor season to make three good colonies out of

one. It may be necessary for you to feed in order that there may be enough stores for winter.

The white brood carried out was not from foul brood. Bees don't carry out brood affected with foul brood, but let it decay in the cell. A bad smell does not necessarily come from foul brood, for sometimes a very disagreeable smell will be in a hive for a short time that seems to come from the stores gathered. While there is a possibility that there may be foul brood, there is nothing in the statement you make that may not easily be accounted for without the presence of any disease.

Late Transferring and Uniting.

1. I have kept bees only the past six months, but if I have no honey to show, I have gained in experience, as I have transferred several box-hive colonies and introduced a queen successfully. One of my neighbors intends to bring a number of this season's first swarms for the honey, but will give me the bees if I take the honey away. Is it too late to build up a good colony from them by feeding?

2. Would you give them an Italian queen, or wait until spring?

3. Could I put the two or three colonies together? They will have to be carried two miles, and perhaps the shaking up would keep them from quarreling.

4. How late in the fall could I build up a colony?
CONNECTICUT.

ANSWERS.—1. If the weather is favorable there is probably time yet to accomplish your purpose.

2. It would be better if the united colony could start in at the very beginning next spring with an Italian queen, but there are difficulties in the way. The bees not being on combs yet, it will be hard for you to look over them to find the black queen or queens, and after combs are built it will be pretty late.

3. Unless the colonies are *very* strong, you will succeed better to unite two or three in one, and you are right in thinking the shaking up of the journey would help to prevent quarreling. Being deprived of all combs will also prevent quarreling.

4. That depends upon the character of the season. You may do the work any time in the fall if there is still left two or three weeks of weather warm enough for bees to fly. Of course, the earlier the better, and the bees should have full sheets of foundation.

Arrangement for Wintering Bees.

1. What do you think of my plan for out-door wintering? I have 35 colonies. My plan is to take good No. 2 tongue-and-grooved siding or flooring 16 feet long, and as I keep my bees about 3 inches from the ground, I would shift them a little day by day until I got them in rows of 10 in a row, then take the lumber that I just named—take some 1x2 inch strips and make the back 30 inches high, the roof 30 inches wide, so that I can take the back and top and front down in separate divisions; smooth the earth off a little, and let the hives rest on the earth about 2 inches apart, and leave a space of about 4 inches behind the hives and the back of the shed or box that I put the bees in, and stuff it in tight behind and between the hives with dry oats-straw. Then make a front to the little shed all in one piece, so I can let it down or leave it up, just to suit the weather, but will not put any straw in front of the hives at all, have them face the South, and as the hives sit on little inch thick strips, it leaves the space of 3 inches under the hives to be packed with straw. By using a lath about two feet long the straw can be packed around the hives very solidly and neatly.

It will cost me about \$15.00 to fix them that way. The lumber can be taken down in sections, and put away when not in use. They will last a long time that way, and be a short job to put them up or down.

2. If made that way would the bees get mixed up if they were moved a little at a time the way I spoke of? You see, I would shut the front of the shed when it is real cold, and sometimes in the middle of the day, when it warms up a little, and the snow is real dry, I would close it and the bees would not fly to get stuck and die in the snow. It would be almost the same as a chaff hive, and lots cheaper.

3. Do you think if fixed that way they would breed in the wrong season on account of the sun shining on the fronts of the hives? I would leave the front of the shed or

box, or whatever you call it, open, except in real bitter-cold weather.

I would not pack the bees before Nov. 15. I would get the hives spaced sooner, but would not put the little shed around them until that time. KANKAKEE.

ANSWER.—1. Your plan will probably work well, altho it will be some trouble to move the hives together and then get them back again in spring.

2. There might be some mixing up, but hardly enough to do any harm if the moving is gradual. If one or more days come when the bees do not fly, then there will be no use in moving again till the bees fly.

3. It is not likely that any great harm would come from breeding out of season.

A Queen Lays Two Kinds of Eggs.

There is a dispute between two bee-keepers. The question is: Does a queen lay different kinds of eggs—queen, drone and worker—or does she lay the same kind of an egg in each cell, and the bees do the rest? NEBRASKA.

ANSWER.—A normal queen lays two kinds of eggs, impregnated and unimpregnated. If the egg is impregnated on its passage thru the duct that leads outward, then it will produce a worker. If unimpregnated it produces a drone. An impregnated egg may also produce a queen, if properly fed for that purpose by the nurses. That is according to the Dzierzon theory, which up to the present time is generally accepted among bee-keepers.

A Method of Wintering Bees.

On page 500 is an article by D. H. Metcalf, describing (in part) his method of wintering bees, but I must confess I do not understand his system. Can you tell me how his hives are made, how those storm-doors or entrances are arranged, and in what part of the hive they are located? If his system is a success, as represented, will it not be a boon to the bee-keeping fraternity? Is it not worth investigating, and giving it a trial? If you cannot give a full description of the system, perhaps you can induce the author to do so. UTAH.

ANSWER.—I don't know enough about Mr. Metcalf's plan to reply, and perhaps he will be kind enough to give the desired information. In reply to your question whether his system will not be a boon to the bee-keeping fraternity, I must confess I don't know. First, because I don't know just what his system is, and second, because he goes "contrary to the advice of all experts." Without saying Mr. Metcalf is not eminently successful in wintering, that sounds just a little as if all others of experience are wrong and only Mr. Metcalf is right, and it may be a question whether Mr. Metcalf's success is because of his leaving the beaten path of all bee-keepers of experience, or in spite of it. Of course there is a possibility that all others are wrong and Mr. Metcalf right, in which case he is entitled to all the more credit for blazing a new path.

Size of Hive—Average Surplus, Etc.

1. What size of hive will be about the best for this locality, the 8 or 10 frame dovetailed, or wouldn't it be better to use the 8-frame 1½ story for brood, instead of 10-frame one-story?

2. About what is the average of surplus honey per colony in this (Rice) county, or in this State?

3. Is Minnesota good for producing honey?

4. Can there be used more Ideal supers than one at a time?

5. What super is the best for producing straight sections, and the most of them? MINNESOTA.

ANSWERS.—1. The best size of hive depends much upon the man and the management, as also on locality or pasturage. The matter has been pretty fully discussed in this and other bee-papers lately, occupying many pages. As you speak of sections, you probably mean to run for comb honey, in which case the 8-frame hive may suit your purpose, using two stories whenever more than eight frames are needed. But unless you give close attention to the bees, the 10-frame hive will be better, with less danger of starvation in winter. The objection to a 1½-story hive is the two different kinds of frames; otherwise you might like it. Try to find out the

kind of hives used by the most successful bee-keepers in your region, and if you cannot satisfy yourself in this way you can try two different sizes side by side on a small scale, and find which succeeds best in your hands. Indeed, this latter way, altho taking time and trouble, is the more sure way.

2. I have no means of knowing, but perhaps some bee-keeper in your county will give his average in these columns.

3. Some bee-keepers have succeeded well in Minnesota.

4. They may be piled up to any extent.

5. One super will produce as straight sections as another, providing separators are used; and the number of sections does not depend upon the sort of super.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

BEEES AND PEAR BLIGHT.

"Hast thou found me, O mine enemy?" The enemy has found us this time, it seems—and has secured a scientific certificate of the fact. Bees actually guilty of carrying the blight with them from infected orchards to healthy ones. Sorry. But what then? Squirting poison on the bloom will not kill the bees promptly enough to prevent it at all. Better squirt at something that needs killing, and do the job at killing time. Perhaps in time even the scientists may reflect that bees do not *very often* visit two orchards the same day. Page 565.

WATERMELON-JUICE FOR WINTER STORES.

Possibly Dr. Miller's reply about watermelon-juice, page 551, may need a little bit of qualification. I have read somewhere about watermelons in Italy being largely fed as a winter supply. If any one has that scheme in mind he should remember that the winters of Italy and our Northern winters are very different affairs. Success there would not necessarily mean success here. Better go slow till American experience in a long, hard winter decides the matter. It's a seductive scheme for lazy folks, to sell all the honey, and then make the bees stock up for winter on late melons, sliced few at a time right where they lie.

STINGLESS OR "COOL-TAIL" WASPS.

Scientific item by Prof. Cook, page 555. No stingless wasps. Thanks. The wasps are a very numerous generation (some of them nocturnal), and most of us did not know for dead sure what to expect of their little tails. Wish he had explained whether the phrase, "in our country," meant that there are some outside, or only that science does not presume to say yet all that is, or isn't, in central Africa and central Asia. And I thirst for more information about *male* wasps—whether all, many, or only a rare few of them have cool tails.

TAR-MAKING SMOKER-FUEL.

On page 549, we find Dr. Miller's Black-Drop. No one admires it, or even prescribes it; but Mr. Thompson and many others continue to retail it by the drop around their otherwise cleanly premises. Business goes right on, even if you clean the smoker and wash it with tears. Dr. Hasty would prescribe a change of fuel. Some fuels are always daubing things up with fluid tar; some never do anything of the kind, and some seem to be which and t'other, according to weather and the circumstances. Pays to have some fuel in stock that won't make tar.

DEEP FRAMES FOR WINTERING.

Significant that Edwin Bevins finds, page 548, that his colonies on deep frames do not die in winter and leave him frames of *that sort* to experiment on. Still, this reviewer inclines to say, don't be too fast in deciding whether it is the mere depth of the frame, or the increase size of the brood-chamber, that causes the good results.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39.

OCTOBER 12, 1899.

NO. 41.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Philadelphia Convention Report is again delayed, we regret to say. The copy did not reach us in time for the usual installment to appear this week, on account of the illness of Secretary Mason. We hope that it will not again be delayed, as it is quite trying to us as well as to our readers.

A Consolation it may be to many a bee-keeper this year, when prices of supplies are advancing, to know that such advances do not directly affect him. He does not need to pay the advanced prices for shipping-cases, nor yet for sections for the next season. All of which consolation comes from the fact that he has had no crop this year, so needs no shipping-cases, and the sections (if he has any on hand) intended for the crop of 1899 are all right for the crop of 1900.

Cleaning Up Unfinished Sections.—This is a good time of the year to recall the views of experience as to sections having too little honey in them to be put on the market. A large number are agreed that such sections, if properly cleaned out, are valuable for use the following season. But there is no means by which the bee-keeper can properly clean them, unless he has it done by the bees. If they are extracted, and the least particle of honey remains in them till next season, that least particle will granulate, and if the bees store honey in it subsequently it will be a spoilt section. So it is the practice of some to let the bees do all the work of emptying and cleaning without at all resorting to the use of the extractor. The trouble is that the average

beginner will have not only the whole of the honey emptied out, but the larger part of the comb as well.

Two quite diverse methods of avoiding this tearing of the combs by the bees have been advanced. Dr. Miller says: "Put your supers of sections in piles where the bees can rob them, but give them so small an entrance that only one bee at a time can enter." The late B. Taylor gave nearly opposite advice, saying: "Put your supers of sections fully exposed, so the bees can all get at them from all sides." Both ways are right used under the right conditions.

Suppose you have an apiary of 50 colonies. If you have a single super of unfinished sections to offer the bees for a job of polishing, the Miller plan will succeed perfectly, while the Taylor plan will leave most of the comb chewed up fine. If you have 50, or even 20, such supers to offer the 50 colonies, either plan will succeed, but the Taylor plan will make a much quicker job, and in some cases that is quite important, as a closing down of the temperature may prevent work on future days. So if you have many sections to be cleaned out, give them all the publicity possible, but if less than perhaps ten sections to a colony, give entrance to only one bee at a time. In any case, get the cleaning up done by the bees as early as possible.

Illinois State Fair Apiarian Exhibit.—It was our pleasure and privilege again to attend the State Fair of Illinois, held at Springfield the last week in September. Of course, we were most interested in the exhibits made by bee-keepers, and doubly so as it was our duty to act as judge in awarding the \$268 in cash premiums offered in the apiarian department.

Before giving a list of the winners of the premiums, we wish to congratulate the bee-keepers of Illinois upon two things. First, their good fortune in having so able and interested a man as Mr. H. J. Cater as superintendent of the department; and, secondly, we feel that they deserve special commendation upon the large and attractive exhibit put up this year. We believe it exceeded in extent and general display anything that has hitherto been attempted by the bee-keeping industry of the State.

The following is the premium list, with those who secured them, and the several individual amounts:

Display of comb honey—1st premium, J. Q. Smith & Son, of Logan County, \$20; 2nd, W. Z. Hutchinson, of Michigan, \$15; 3rd, Jas. A. Stone & Son, of Sangamon County, \$10.

Collection of labeled cases containing 12 or more pounds of white honey from different flowers—1st, Chas. Becker, of Sangamon County, \$8; 2nd, J. Q. Smith & Son, \$5; 3rd, W. Z. Hutchinson, \$3.

Collection of labeled cases containing 12 or more pounds of amber or dark honey from different flowers—1st, J. Q. Smith & Son, \$8; 2nd, W. Z. Hutchinson, \$5; 3rd, Geo. Poindexter, of DeWitt County, \$3.

Case of white clover comb honey, 12 to 24 pounds—1st, W. Z. Hutchinson, \$4; 2nd, Jas. A. Stone & Son, \$3; 3rd, J. Q. Smith & Son, \$2.

Case basswood comb honey, 12 to 24 pounds—1st, Chas. Becker, \$4; 2nd, W. Z. Hutchinson, \$3. (No 3rd entry here.)

Case amber comb honey, 12 to 24 pounds—1st, J. Q. Smith & Son, \$4; 2nd, W. Z. Hutchinson, \$3; 3rd, Chas. Becker, \$2.

Display of extracted honey—1st, J. Q. Smith & Son, \$20; 2nd, Chas. Becker, \$15; 3rd, Jas. A. Stone & Son, \$10.

Display of honey extracted on the ground—1st, J. Q. Smith & Son, \$5; 2nd, Chas. Becker, \$3; 3rd, W. Z. Hutchinson, \$2.

Frame of comb honey for extracting—1st, Jas. A. Stone & Son, \$5; 2nd, J. Q. Smith & Son, \$3; 3rd, Chas. Becker, \$2.

Display of candied honey—1st, Jas. A. Stone & Son, \$20; 2nd, W. Z. Hutchinson, \$15; 3rd, J. Q. Smith & Son, \$10.

Display of beeswax—1st, Jas. A. Stone & Son, \$12; 2nd, J. Q. Smith & Son, \$8; 3rd, Chas. Becker, \$4.

One-frame observatory hive of dark Italian bees—1st.

Geo. Poindexter, \$4; 2nd, Mr. Shank, of Adams County, \$3; 3rd, J. Q. Smith & Son, \$2.

One-frame observatory hive of golden Italian bees—1st, J. Q. Smith & Son, \$4; 2nd, Geo. Poindexter, \$3; 3rd, Mr. Shank, \$2.

One-frame observatory hive of Carniolan bees—J. Q. Smith & Son, \$4; 2nd, Geo. Poindexter, \$3; 3rd, Chas. Becker, \$2.

Honey-vinegar, one-half gallon, with recipe for making—1st, W. Z. Hutchinson, \$4; 2nd, Jas. A. Stone & Son, \$3; 3rd, Geo. Poindexter, \$2.

We feel that special mention should be made of the exhibit put up by J. Q. Smith & Son. In space occupied, in quality and quantity, and in general attractiveness we have rarely seen an exhibit of a similar nature to equal it. It was a pleasure to the judge, when he had finished his work, to find that this exhibit had deservedly led in the race for the premiums offered.

The other apiarian exhibits were good, and were a credit to those who went to the effort and expense to prepare and place them. All must have served as a silent but effective educator to those who knew little of the extent and importance of the industry of bee-keeping in Illinois.

We hope that next year even more of the bee-keepers in this State will be found among the exhibitors, and thus show their appreciation of the efforts of Mr. Cater and the Fair managers to give apiculture an opportunity to place its products before the people in a proper manner.

Supt. Cater hopes, another year, to have the apiarian exhibit on the first floor of the Dome Building instead of the second floor. He wants the dairy and apiary together, which is quite proper in "a land flowing with milk and honey"—only in this case it would be *butter* and honey. The corner of the building now occupied by the Culinary department would be a splendid location for the Apiary department, as the light all around it is all that could be desired. It is to be hoped that Mr. Cater will succeed in securing it for the bee-keepers. The *best* place is none too good for them, you know!

A Gala German Honey-Market.—Mr. F. L. Thompson tells, in the Bee-Keepers' Review, something about a unique way they have of marketing honey in Germany. Here is his report of a certain affair:

On Aug. 29, 1897, thru the efforts of the Kaerntner Association, a honey-market was held in the city of Friesach, in Kaernten. For weeks before, the occasion was advertised in the local newspapers of the district. The city was decorated on that day, and about 500 strangers, outside of the townspeople, came to be entertained. The market was held in the afternoon, in ten large tents, decorated with branches of fir, containing long tables spread with white cloth on which the honey was arranged, mostly in glass. In some of the tents exhibitions were given by 16 boys and girls of the public school, in uncapping and extracting honey, making foundation, and nailing frames. The costs were reimbursed by the sale of souvenirs, such as scarf-pins representing bees, etc., by young women in country costumes. The sale of honey was a success, altho the prices were pretty stiff in comparison with the customary ones, and many orders were taken to be filled later.

The day was closed by a bee-keeper's convention, at which it was resolved to hold another market the next year at another town.

Special Notice to Our Subscribers.—Returning a copy of the Bee Journal to this office will not secure its discontinuance. If you want your copy stopped, be courteous enough to write us, enclosing any back dues, and request that it be discontinued.

Foreign subscribers will please remember that all the offers we make at any time are only for people living in the United States, Canada and Mexico. To all other countries postage is extra not only on the American Bee Journal itself, but on nearly everything else. It will thus easily be

seen by any thinking person that any prices we quote are not for people living in foreign countries.

Again, when you wish us to change your Bee Journal address on our list, don't fail to write us both your new and old addresses. Otherwise we can't find your name so as to change the address.

Dr. A. B. MASON, Secretary of the United States Bee-Keepers' Association, writing us Oct. 5, said:

FRIEND YORK:—We got home late last Saturday night, and I with a slight chill nearly all the way from Buffalo, and have had quite a sufficiency at frequent intervals since. In spite of the doctor, I sit up a few minutes and then lie down for a few hours, perhaps, more or less, but am a little better to-day.

I'm as sorry as you about delayed report, and would not have had it begun so soon if I had supposed we should be kept from home so long, but it was impossible to do any better. I enclose what I have, and am expecting more every day, and I'll keep you supplied hereafter.

When we got home we found our daughter Flora had broken her right arm at the time Mr. Abbott was reading his paper at the convention, but the children hadn't said a word to us about it until we got home. It was well set, and is doing well.

Well, I must lie down again, but have a pile of unanswered mail on hand. If Flora had broken the left instead of the right arm I would not have to write.

Yours truly,

A. B. MASON.

We were very sorry indeed to hear of Dr. Mason's illness and Miss Flora's serious accident. The Doctor's many friends will regret to learn of his afflictions, and unite with us in the hope that both he and his daughter may speedily recover, and again be as strong as ever.

THE ILLINOIS STOCK-BREEDERS' ASSOCIATION will hold their annual meeting in the State House at Springfield, Nov. 14, 15 and 16. This includes the associations devoted to breeding horses, cattle, swine and sheep—four of them. A splendid program has been issued, a copy of which may be had by writing Secretary Fred H. Rankin, Athens, Ill. We notice that Jas. A. Stone, Secretary of the Illinois State Bee-Keepers' Association, is down to discuss "Sheep-Breeding." Tho quite a sheepman, our good friend doesn't look a bit sheepish!

Low rates on all the railroads to Springfield will be in force at the time mentioned. Address Secretary Rankin for any further information you may desire.

MR. JOHN W. LYELL, of Washoe Co., Nev., wrote us as follows, Sept. 25:

"I cannot well do without the American Bee Journal. It has come to be too regular an object of interest on our center table to miss one now. The honey crop will be below a three-fourths crop as far as heard from, but prices are unusually low, according to quantity. Quality is excellent."

THE PETTIT PICTURES shown in this number of the American Bee Journal are the property of the Farmer's Advocate, published at London, Ont., Canada, one of the best agricultural periodicals on this continent. They very kindly loaned us the two engravings.

MR. E. R. JONES, president of the Central Texas Bee-Keepers' Association, writing us Sept. 29, said: "Dry, dry, DRY! Many bees are actually starving to death."

The Premiums offered on page 655 are well worth working for. Look at them.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | | | | |
|----------------------|----------|--------|--------|--------|
| | 5lb | 10lb | 25lb | 50lb |
| Sweet Clover (white) |60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover |70c | 1.25 | 3.00 | 5.75 |
| White Clover |80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover |60c | 1.20 | 2.75 | 5.00 |
| Crimson Clover |55c | .90 | 2.00 | 3.50 |

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight. Your orders are solicited.

BEEDOM BOILED DOWN

Doolittle's Cell-Cups, according to an item in Gleanings in Bee-Culture, will probably be put on the list of bee-keepers' supplies in the near future.

Why No Honey from Clover.—D. D. Hammond says in Gleanings in Bee-Culture that no matter how abundant is the bloom on white clover of the first season's growth, it will yield no nectar till the growth of the second year.

Still a Different Hive is Wanted by R. S. Chapin, who says in Gleanings in Bee-Culture that he doesn't want a Draper "barn" with its 10 frames, but he would like a hive with 8 frames of the deeper sort. This would give him all the advantages of the ordinary 8 frame hive, which he likes, aside from the objection that it contains a scant supply of stores for winter.

Rambler's Improved Honey-Strainer is described in Gleanings in Bee-Culture. Simply cheese-cloth; but cheese-cloth soon becomes clogged. So he provides against this by having cheese-cloth 3 yards long and 1/2 yard wide, each end attach to a roller, somewhat after the fashion of a window-shade on a roller. When the part in use becomes clogged, it is rolled up, and a fresh part rolled off from the other roller, and this is continued till the whole 3 yards has been used, when the whole piece can be washed.

Burying Bees in Winter has been little mentioned of late years, but Lebrecht Wolf speaks of it in highest terms in Deutsche illustrierte Bztg. No disturbance thru frequent changes of temperature, no seductive sunbeam entices the bees forth to their ruin, no disturbance from rats, mice, etc., no winter's cold severe enough to injure them; quietly they sleep away their winter's rest, leaving the bee-keeper free from all care regarding them. The view formerly held, that it is desirable for bees to have a flight in winter is now generally given up, says Herr Wolf, a cleansing flight in December, January, or the first half of February being highly detrimental to the bees.

The slaughter of bees by brimstone is the heading of an article in a German bee-journal in which the writer deplores the continuance of the old custom in his land by which thousands of colonies are sacrificed, and proposes to put a stop to it by buying up all colonies condemned to the sulphur pit. Not being able financially to compass the whole field, he makes an appeal to his bee-keeping friends to come to his aid by sending him orders for colonies. One is somewhat puzzled to know whether this is a bit of shrewd advertising, but against it is the high character of the journal in which the article appears—Deutsche illustrierte Bienenzeitung—as well as the fact that he claims to ask only the price he himself pays, which may easily be, since he asks only \$2 50 for a colony with 16 to 25 pounds of honey, guaranteeing safe arrival.

Markets Bare of Honey, and Why.—I have already spoken of the markets generally being bare of honey, and that the cause was due to the fact that buyers were not offering enough. Altho I have spoken of this in this issue, I believe the matter needs special emphasis again. Bee-keepers should not be in haste to sell their honey just yet. Honey has advanced very materially in California and the West

**THE A. I. ROOT CO.,
MEDINA, OHIO.**

generally. Extracted that sold in California for 3½ cents is now selling for 7. According to the same ratio, comb honey that sold two years ago at 10 cents in our markets should now bring 20; and yet 13 to 15 is about the top notch of the Eastern market. If the buyer wants honey it appears to me he will have to offer more than these figures. There is evidently much honey in Colorado, but it will never find its way East until our markets advance more than they have done.

It should be understood that commission quotations usually stand higher than cash offers, for the reason that from the former must be deducted freight and 10 percent commission; but in whichever way the offer is made, the honey-dealers should understand that they will have to advance some before they will have much honey to offer.—Editorial in Gleanings in Bee-Culture.

The Maroon-Yellow Question, and Pure Italians.—To the question askt Mr. Doolittle by Dr. Miller, why it was that Mr. Doolittle in all these years never before said that Italians were maroon and not yellow, Mr. D. starts to make reply in Gleanings in Bee-Culture, but before reaching the question proper seems to become switcht off onto a side-track, and never returns to the main line. He refers to the discussion in the early seventies about the purity of Italians, when he says it was fully proven that the Italians are not a pure race. Then the matter died down, says Mr. Doolittle, who continues:

"But for the past 5 years this matter of 'markings' has again forged to the front, and the low rumblings of dissatisfaction first heard have almost reacht the fury of a storm, and parties are being denounced for lying about the markings, purity and color of their bees, and thus an *unimportant* matter has become an *important* one."

Editor Root replies that they sell \$2,000 to \$3,000 worth of queens every season, this year more than ever, and if any complaint has come in to them with regard to the color matter he does not remember to have seen it. He says he agrees with Mr. Doolittle that the only way to determine the purity of Italians is by their markings, and that "placing bees on a window, before the light, is an extreme and perhaps unreliable test for the determination of the purity of the bees in question."

Well Satisfied with Results.

I bought one colony of bees last fall; they wintered well, and in the spring I put them out and kept the cold winds from them, and also protected them from the hot rays of the sun. They gave me two good swarms in June, and as I did not want them to swarm again I took 10 pounds of box-honey from the super the first of July, so as to give them room. Sept. 15 I took 30 pounds more of box-honey from the old colony, and 30 from the first swarm, none from the second. This is my first experience. I am very well satisfied. As there are no bees kept within several miles of me, and there is plenty of clovers, basswood and golden-rod. I hope to keep quite a number of colonies and do well. I followed the Bee Journal's advice. W. M. BROWN.

Herkimer Co., N. Y., Sept. 23.

One of the Numerous Asters.

Our bees are rolling in nectar from wild aster, whenever it is warm enough for them to work on it. Our first frost came about a week ago and still it does not seem to have any effect on the aster, altho we have had two or three frosts since. I send a bunch of asters, showing its stalk and blooms, which I pluckt from a swamp where

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 26 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road, or Milwaukee Ave., now, and 1½ miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc., Mrs. J. B. Agers, Libertyville, Lake Co. Ill. Please mention Bee Journal when writing.

the frost was severest. Very little pollen seems to be gathered from it. It grows two and three feet high, and seems to grow as well on old, wornout, rocky fields as anywhere. I consider it a very good honey-plant, altho its honey does not rank with white clover. I would like a report on it.

It seems as if I could hardly wait for the time for the "Old Reliable" to come, especially since the beginning of the report of the Philadelphia convention. Its brilliant pages seem like a new hope, and to thrill the whole body, which only a bee-keeper can experience.

J. WILEY MOUNTROY,
Anderson Co., Ky., Oct. 11.

[The asters are so numerous, and the flowers of so many are so nearly alike that it is somewhat difficult to determine the variety unless one is pretty well up in that line. Sometimes leaves are the only distinguishing features of a dried specimen, and should always accompany the plant when possible.

I believe the plant to be *Aster pinicens*. The flower is quite common in low thickets and swamps, and in common with others of its kind furnishes abundance of good, rich nectar for fall storage.—C. L. WALTON.]

Bees are Like People.

I have concluded that bees are like people, when some will do well others will do nothing. I have colonies that did not give me a pound of surplus, and another right beside it that gave me 28—both good, heavy colonies. What's the trouble? A change in administration is what is wanted, and I am putting in Italian queens in those colonies that did nothing.

The season has been had here, dry and hot. When I read about those large honey records it seems queer when I can only get 25 pounds, but I get 25 cents for every pound.

H. A. FISHER,
Plymouth Co., Mass., Oct. 3.

A Brief Report.

Poor season. Bees to feed. Not much honey. Not much money. Looking for a good season always to be better next year. Looking for a horseshoe and don't find it. Lake Petroleum V. Nasby's man—do better after to-morrow.

J. V. B. HERRICK,
Hennepin Co., Minn., Sept. 28.

Bees Have Done Nicely.

We are having it rich this year. Every one's bees are doing nicely. I will give you a little idea how my bees are doing.

Honey taken off, Sept. 21, colony No. 9, 16 Langstroth frames, and one super on, all full, ready to be capt over; swarm from colony No. 1, 26 Langstroth frames; No. 6, 15 frames; No 5, 20 frames; No 1, 20 frames; and No. 2, 20 frames.

A. E. Smith has bought Mrs. McGarvis' bees; she had 40 colonies, and he gave her

Our Great Trial Trip Offer!

3 months for only 20 cents,

WE want to add a lot of NEW subscribers to our list during the next two months, hence this **SPECIAL TRIAL OFFER.** It is 13 copies of the old American Bee Journal for 20 cents—about a cent and a half per copy. If **THREE** new trial trippers are sent together, they will be received for 50 cents.

We would be pleased to have our friendly readers show this trial offer to their bee-keeping neighbors and acquaintances, and send us a few new subscribers. You will do both them and us a great favor.

The best part of the Philadelphia Convention Report will appear in those 13 numbers.

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

BEST WHITE ALFALFA HONEY

In 60-pound Tin Cans.

WE have been able to secure a quantity of WHITE ALFALFA EXTRACTED HONEY which we offer for the present at these prices, on board cars here in Chicago: Sample by mail, 10 cents; 2 60-pound cans, in a box, 9½ cents a pound; 4 or more cans, 9 cents a pound. **Cash with order** in all cases. Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

300 pounds in sections, put up in shipping-cases, and all the honey that is ready to take off. This will make him 82 colonies. He said if we had two weeks more of nice weather we would get one more super full. Posey Co., Ind., Sept. 25. **IRA NYE.**

Counted on Too Much.

I was counting on 10,000 to 12,000 pounds of honey, but it did not all run down, altho I had the platter clean and the right side up; but I am thankful for what I did get. Lots of honey-dew is coming in; it is bright and of pleasant flavor. I shall feed a little honey and sugar and risk it for winter stores. The bees are breeding like summer time. This I regret, but I cannot help it. **S. T. PETTIT.**

Elgin Co., Ont., Canada, Sept. 21.

One of the Clovers.

I send a few plants of some kind of clover, as I believe. Kindly say what it is, and whether it is of value as a honey plant.

Pierce Co., Wash. **G. C. BRITTON.**

Prof. C. L. Walton, 2803 N. Ashland Ave., Chicago, Ill., botanist for the American Bee Journal, replies as follows:

The plant is a clover, *Trifolium procumbens*, but is not as good a honey-plant as some other clovers, such as the white, sweet and Alsike. While not so profitable to cultivate as other honey-plants, yet when growing wild it may afford good storage when other supply fails.—**C. L. WALTON.**

Liberal Amount of Fall Honey.

Since my last report I have secured quite a liberal amount of fall honey, mostly amber, from golden-rod and Spanish-needle, the marshes here being yellow with the latter during the latter part of August and first few days in September. The hives also are unusually heavy with stores, and the honey, I think, is of the best quality for wintering purposes. **B. T. DAVENPORT.**

Waushara Co., Wis., Sept. 23.

Hard Year for Vermont Bee-Keepers

This has been a hard year for Vermont bee-keepers. I started in the spring with 55 colonies, and now have 90. I secured only 1,500 pounds of honey, mostly extracted. Comb honey brings 20 cents as quick as one dollar will bring another. Bee-keepers who last year had 10 to 15 tons of honey have less than one now, and have to

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad-tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and

ELECTRIC

rear hounds are made from the best angle steel, which is neater, stronger and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4,000 pounds anywhere. Write the Electric Wheel Co., Box 16, Quincy, Ill., for their new catalog, which fully describes this wagon, their famous Electric Wheels, and Electric Feed Cookers. Please mention the Bee Journal.

Queen-Clipping Device Free...

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. We mail it for 25 cents; or will send it FREE as a premium for sending us ONE NEW subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,

GEORGE W. YORK & COMPANY,
118 Michigan St., Chicago, Ill.

feed tons of sugar to winter the bees; and bees are not in good shape, the drouth having kept them from breeding, and so they are light in bees. **M. F. CRAM,**
Orange Co., Vt., Sept. 25.

Too Dry for Honey.

Bees have stored no honey here since July 15, on account of its being too dry.

G. W. FAGAN,
Arkansas Co., Ark., Sept. 20.

No Surplus and Must Feed.

I have taken no surplus this year, but have to feed a few of my colonies. Last year I had a surplus of 400 pounds from 5 colonies. This year I have 10 colonies and have to feed some. This is quite a difference.

GUSTAVUS KOLLS,
Hall Co., Neb., Sept. 25.

Bur-Marigold.

I send a specimen of plant that grows along the lake shore and swampy places, which I wish to have classified and also named. The bees work on it faithfully.

CAS. LINDBERG,
Meeker Co., Minn., Sept. 25.

[The specimen is *Bidens chrysanthemoides*, a rather formidable name for such a modest flower. The common name is Bur-Marigold, and belongs to the great composite family. Prof. Cook says it is replete with precious nectar and makes the apiarist jubilant as he watches the bees flood the hives with the rich and precious honey.—(Bee Keeper's Guide)—**C. L. WALTON.**

Don't Worry About Salaries.

"What salaries are paid in different business callings is a question often asked by young men, and one which seems to enter into their deliberations as a qualifying factor as to whether they shall enter certain trades or professions," writes Edward Bok, in the September Ladies' Home Journal. "I never could quite see the point of this, nor the reason for it. What are the salaries which are paid to others, to you or to me? They signify nothing. If the highest salary paid to the foremost man in a certain profession is \$10,000 a year, what does it prove or signify? There is no obstacle to some one's else going into that same profession and earning \$25,000. The first step in going into business is to find out not which special line is most profitable, but which line you are most interested in and

HOG CHOLERA

Save Your Hogs.

SURE CURE and PREVENTIVE.

We have no medicine to sell, but have an effective remedy which will check the ravages of the plague and **save your hogs.** The disease is caused by a germ. This preparation is a powerful antiseptic which **destroys the germs** without injury to the hogs. The material can be obtained at any village store at the cost of a few cents. Any farmer can prepare and apply it. If used in time is a **certain preventive** and a **sure cure** for hogs not too far gone. Full information with directions are given in a very valuable work entitled **"The Hog, by 15 Specialists"** which in addition to giving full details of this remedy furnishes

information on every phase of hog raising and marketing by the most eminent authorities, experienced hog raisers and packers in the U. S. and Canada. To save the millions of dollars annually lost to farmers through this plague we desire to give this book the widest possible distribution and at the same time introduce to new readers **The NATIONAL RURAL and FAMILY MAGAZINE, America's Great-est Farm Journal** for 40 years known as **The Western Rural.** Published weekly, 32 to 40 pages, fresh, up-to-date matter each week. Profusely illustrated. Subscription price \$1.00 per year. **Sample paper free.**

To send **The Rural** 3 weeks on trial (price 25c) and a copy of the above work (price 25c) to any address for 25c

25c. Coin or Stamps

Club Offer:

For \$1 we will send 5 copies of each. For \$1.50 we will send 10 copies and a book, and a year's subscription to the club raiser free.

Make up a club of 10 and thus assist in stamping out or preventing the swine plague from getting a foot hold in your neighborhood. Address **THE NATIONAL RURAL, Chicago, Ill.**

You Should "Watch" Yourself

Lest You get "Behind Time."

THE WATCHES we offer here are genuine bargains, and if you have none you will not make a mistake if you get one of these. They are equal to any \$15.00 or \$20.00 watches as time-keepers.

146

No. 146 is a Gentleman's genuine open face Elgin, Waltham, or Hampden, the movement nickel-finish, compensation balance, straight line escapement, quick train, patent safety pinion, double brace main-spring, Breguet hair-spring. The Case is Silverine with screw front and back, and of good weight, thus making a perfect, dust-proof watch.

No. 143 is a Lady's genuine Elgin, Waltham or Hampden, the movement nickel finish, 7 jewels, compensation balance, Breguet hair-spring, with Silverine hunting-case.

143

Our Offers on these Genuine WATCHES :

No. 146 we will send prepaid, by express, to any address, for \$7.00; or will give it free as a premium for sending us 12 new subscribers for the American Bee Journal for one year at \$1.00 each; or we will club it with the Bee Journal for one year—both for only \$6.50.

No. 143 we will send prepaid, by express, to any address for \$8.00; or we will give it free as a premium for sending us 16 new subscribers for the American Bee Journal for one year at \$1.00 each; or we will club it with the Bee Journal for one year—both for only \$7.50.

We believe we have never offered any premiums to our readers that we think will give the satisfaction that these watches will. They are not cheap "clocks," but really valuable watches that will wear well, run all right, and be worth much more than is paid for them. Here is a chance to make a gift to some boy, girl, young man or young lady. Everybody ought to have a good watch. Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

Page & Lyon Mfg. Co.

NEW LONDON, WIS.,

Operates two Sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of ... Bee-Keepers' Supplies...

They have also one of the LARGEST FACTORIES and the latest and most improved machinery for the manufacture of Bee-Hives, Sections, &c., that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the clearest and whitest Basswood is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the BEST GOODS AT THE LOWEST PRICES.

Send for Circular and see the prices on a full line of Supplies.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 20.—Fancy white comb honey brings 15c; No. 1, 13@14c; ambers, 10@12c; dark, 9@10c. Extracted, white, in cans, 7 1/2@8c; in barrels, 7@7 1/2c; amber, 6 1/2@7c. Beeswax, 20c.

The receipts are increasing and sales are becoming more frequent. Shipments are coming to hand in good order, and when properly prepared will do so until we get zero weather, after which it is liable to crack, and break away from the frames. R. A. BURNETT & Co.

KANSAS CITY, Sept. 14. The supply of comb honey is very light. Scarcely any extracted on the market. We quote fancy 1-pound comb, 14@15c; No. 1, 13@14c; No. 1 amber, 12@13c. Extracted, white, 7c; amber, 5@6c; dark, 4@5c. Beeswax, 22@25c. C. C. CLEMONS & Co.

NEW YORK, Sept. 20.—Fancy white, 15c; No. 1, white, 13@14c; fancy amber, 11@12c; No. 1, amber, 10@11c; buckwheat, 9@10c. Beeswax dull at 25@26c.

Demand good for all kinds of comb honey, and ready sale. Extracted in good demand also, excepting buckwheat, at unchanged prices. HILDRETH & SEGELKEN.

SAN FRANCISCO, Sept. 27.—White comb, 11 1/2@12 1/2c; amber, 8@10c. Extracted, white, 7 1/2@7 3/4c; light amber, 6 1/2@7c. Beeswax, 26@27c.

Two shipments of extracted have gone forward to Europe since last issue, the ship Springburn carrying as part cargo 360 cases for London, and the ship Aristomene taking 100 cases for Liverpool. Market shows the same healthy tone as previously noted, with stocks of all descriptions of small volume.

ALBANY, Sept. 26.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6 1/2@7c; dark, 6. Beeswax, 26@28c.

Successors to Chas. McCulloch & Co.

BOSTON, Sept. 21.—Fancy white comb, 1-pound sections, 16c; A No. 1, 14@15c; No. 1, 13@13 1/2c; No. 2, 11@12c. White amber extracted, 8@8 1/2c. Beeswax, 27c.

New comb honey is coming in very slowly, showing a general shortage all over the country. BLAKE, SCOTT & LEE.

BUFFALO, Sept. 26.—There are virtually no arrivals of strictly fancy white comb honey. The very little arriving is poor, and the best of it brings 14 cents. We believe extra fancy would bring 15@16 cents, and any grade will sell well here. If receipts do not increase we may reasonably look for possibly higher prices. There is a very strong demand, quickly taking the few arrivals. BATTERSON & Co.

OMAHA, Aug. 16.—Still very little doing and receipts so light that a market price has really not been established. Little lots of choice new comb are still going at 14@15c, but a good many dealers will not touch it at these prices, and in order to place larger quantities at this time a considerably lower figure would have to be made. In the course of another month, when the weather is cooler and the taste for fruits more fully satisfied, the demand for honey will be more general and a more reliable market can be quoted. Extracted is slow ship at 7@7 1/2c. PRYCKE BROS.

DETROIT, Sept. 11. Honey-producers accustomed to selling in Detroit have hard work to satisfy local trade. Very little honey in market. White comb, 14@15c; dark, 12@13c. White extracted, 7 1/2@8c. No dark wanted. Beeswax, 23@25c. M. H. HUNT & SON.

WANTED Comb and extracted honey; state price, kind, and quantity. R. A. BURNETT & CO., 33A131 163 So. Water St., Chicago, Ill.

WANTED Fancy white comb honey in need shipping-cases. State price, kind and quantity. C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth, 2146 S Central Ave., Cincinnati, O.

CONTRIBUTED ARTICLES

Apiary of Mr. Wm. McLennan, of Hamilton Co., O.

BY JOHN R. SCHMIDT.

The picture shown herewith is one of an apiary of 35 colonies, belonging to Mr. Wm. McLennan, of Hamilton Co., Ohio. The way in which he became interested in bee-culture is very singular, and as it was directly thru the American Bee Journal, I resolved to photograph the apiary, and send it, thinking it might interest the editor as well as his readers. This is how he became interested in bees, as he told me:

Several years ago his wife subscribed for the American Bee Journal. At that time no bees were kept by anyone in the family, but they just took the Bee Journal because they liked it.

One evening, Mr. McLennan finished reading his evening newspaper, at an earlier hour than usual, and having nothing else to read he picked up a copy of the American Bee Journal that was lying on the table. After several repetitions, this became the regular evening routine—newspaper first, Bee Journal afterwards.

After a short time he began to look forward to Thursday afternoon (the day upon which the American Bee Journal arrived), and on this day the Bee Journal was first and newspaper came afterwards.

About this time, the second stage of the fever began to appear. He wanted the bees, and it was not long until he had them.

Last year, Mr. McLennan bought up all the bees in the neighborhood that were for sale, and at present he is thinking about moving his bees out into the country and going into the business.

The person shown in the photograph is Mr. McLennan. The building to the right is a stable and barn, half of the upper story being used for a stock-room, where he keeps

bee-hives, supers, sections, etc. The other half is used for a honey-room, where is kept all of his honey, safe from temptation and robber-bees. Hamilton Co., Ohio.

Feeding Bees for Needed Stores—It Pays.

BY C. P. DADANT.

MR. DADANT: I thank you very much for your kindness in helping me out last June. My bees were near starvation, and I did not know what to do. I thought it would cost too much to feed them, so I ask you if you thought it would pay. You replied that you would feed them all they needed, even if you had to borrow the money to do it. So I was encouraged, and bought the sugar for feeding, being about a barrel and a half, which supplied them until the harvest began.

My crop this year was 2,300 pounds of fine honey, while my neighbors, who keep as many colonies as I do, got very little from them, and some not a pound. One of them, who has kept bees for 15 years, had 30 colonies, spring count, did not feed, and he got only 3 swarms from the 30, and very little honey.

I had 27 colonies last spring, which I fed just as you directed, and I took off the 2,500 pounds of honey, and had 35 swarms, besides, which I think is pretty good for this year.

I began in 1893 with one colony, being 25 years of age. I have been successful ever since in wintering, not losing 3 colonies in the six years of my experience. TORFIELD LEHMAN.

Fayette Co., Iowa.

I can but congratulate Mr. Lehman on his perseverance, and I am glad to be able to record that our advice is not lost, and that we are not the only ones who succeed by

Apiary of Mr. Wm. McLennan, of Hamilton Co., Ohio.

helping the bees to the last. If the reader will refer to page 404, in the American Bee Journal for June 29, he will see how the matter stood.

Feeding pays when absolutely needed to save the colony, and no one should hesitate if he wishes to succeed. As the present season has been one of poor crop in many localities, it is quite likely that a number of colonies are now without sufficient stores for a safe wintering. This should not be permitted to remain thus. They should be fed bountifully, and, I dare say, it is as sure to pay in the long run as the feeding above mentioned paid Mr. Lehman.

I have just read Mr. France's article, on page 606, and I wish to emphasize these words of his: "If you want to winter bees out-of-doors give them a large hive, and a good deal too much honey is just enough." If your bees are short of stores for winter, I would hardly advise you to give them "a good deal too much," but be sure and give them plenty. It does not pay to let bees starve because of a bad season, but it pays still less to feed them stingily, and have them starve after all. So give them all they need. But if you have had a good crop do not stint the bees, leave them "a good deal too much," as Mr. France says. It is this kind of bee-keeping that secures the honey crops for the millions.

If your colonies are strong in bees and poor in honey, it is of no use to induce them to breed to any extent, therefore the feed should be given all at one time, or as nearly at one time as is practicable. Warm feed, given above the brood in Hill feeders or ordinary fruit-can feeders, covered with a cloth and inverted over the cluster, may be fed very rapidly to a strong colony. We always invert the feeder previously over a dish or pan, so that the first flow may come and the atmospheric pressure prevents further sudden leakage. We have thus given 15 pounds of honey to one colony at one feed. We put it on the hive in the evening, when there is the least danger from robber-bees. If honey is not to be had readily, we use mostly sugar syrup, but always mix a third of honey with it.

Colonies which are not very strong in bees may be fed more slowly. While they are taking the food they will breed more or less, and this will serve to strengthen the colony for winter. Weak colonies that do not cover the greater part of their combs would best be warmly covered, or put into the cellar, at the opening of cold weather; and if there is no objection to decreasing the number of colonies of bees, it may be well to unite two or three into one. In this case, the best queen should be retained, and the bees put together, at the same time sprinkling them with sugar syrup. In order more easily to cause them to unite, some apiarists scent the syrup with some strong perfume, such as essence of peppermint, which gives all the bees the same odor, for it is well known that bees recognize each other by the sense of smell, each colony having its own peculiar scent. The sweet food puts them in good humor, and the peppermint prevents them from noticing much difference between the odor of their neighbors and their own. If robbers are kept away, no trouble need be anticipated. The only objectionable feature to uniting bees from different hives into one is the returning of some of the old bees to the former spot, which is almost unavoidable, tho if they are drummed and frightened enough to cause them to consider themselves in a swarming condition, they will usually recognize the new spot readily.

In an apiary where the hives are all of the same pattern—as there are usually some rich colonies even in the poorest seasons—these may be caused to help the others by taking from them whatever they may be able to spare out of their brood department. But it takes a little discernment to do this feeding properly. If you give a weak colony a heavy comb of honey on one side of its cluster, this honey may be too remote from the cluster to be of use to them. It is necessary to examine the hive and put the additional feed in an accessible place, often spreading the thinly supplied combs apart, to place the heavy combs in the center. But these must not be too full. A solid comb of honey would practically split the colony in two, and might prove injurious, for the bees need empty cells on which to cluster, the cells of honey being much colder, and therefore less advantageous to the cluster.

Is it necessary to state here how much honey is needed to winter a colony safely? The amount has been variously given by different apiarists according to the circumstances in which their bees were placed, at from 8 to 40 pounds. A good, middle average is 25 pounds. A colony which has access to about this amount of honey is in good condition for winter. It may consume more in spring breeding, but this may be added after winter, without trouble.

"That Big Nuisance"—The Alley Trap.

BY HENRY ALLEY.

SOME one has taken the trouble to inform the readers of this paper that the Alley queen-trap is a nuisance in the apiary. It seems to me it is rather late in the day for any one to make such a discovery, as the trap has been in use some 18 years, and has been praised on all sides by those who have them in use. The trap can be found in all countries where an interest is taken in apiculture.

Suppose a little pollen, say one percent of all the bees collect (and it is not more than that amount), is brushed off the legs of the bees when they pass thru the metal, does any one have an idea that that would in any way affect the prosperity of the colony? The person who asserts that the trap is "a nuisance" most likely is one of those bee-keepers who has not been long in the business, as it seems to me he would not now attempt to discuss the merits of the trap, as these same charges, years ago, were brought against it, and no one took any stock in them; and I do not believe they will now.

By actual test, hives side by side in an apiary, those colonies in the hives on which were traps stored more honey than those that had no traps. The above test was made by a man whose apiary is in Georgia, and the facts were given to the public years ago. All who have tested the trap have found it one of the greatest labor-saving devices ever used in the apiary.

Yet I have no doubt there are people who think it is much better and easier to climb into a tree, 30 or more feet high, on a hot day—say on a day when the temperature is 90 degrees in the shade—for a swarm of bees, rather than just sit down and see a swarm of bees hive themselves. I like the latter method much the best.

If bees would not swarm, or, if the pesky things when they do swarm, would only settle in a convenient place where they could be hived with as little trouble as they can be when the trap is used; or, if the bees would not swarm when a fellow is away from home, and not expecting anything of the kind, and slip to the woods; and, what is still another bad thing, not rear so many useless drones, the trap could be dispensed with just as well as not.

Now, to pit against all the above-mentioned advantages is the claim that a little of the pollen is knocked off as the bees pass thru the metal into the hive. So far as saying bees do not store as much honey when the trap is used, as colonies do that do not have the trap, that is mere guess-work.

I could say much more of the advantages of the trap, but I think the above is all that is needed.

Essex Co., Mass.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 623.]

SECOND DAY—FORENOON SESSION.

The forenoon session of the second day, Sept. 6, was called to order by Pres. Whitcomb, after which Rev. E. T. Abbott offered prayer.

A communication from the Farmers' National Congress, to meet in Boston, Mass., stating that our Association was entitled to a delegate, was read by the secretary, and it was voted to send Mr. E. A. Wander, of Connecticut, as such delegate.

On motion, the chairman appointed as a committee on resolutions, Hon. Eugene Secor, Ernest R. Root and George W. York.

On motion, it was decided to hold the election of officers for the coming year as near 3 o'clock in the afternoon as possible.

Hon. E. Whitcomb, of Nebraska, then delivered the following

President's Annual Address.

Once again we have assembled from the West, North and the South in this beautiful City of Brotherly Love, in which American freedom began its flight. In the years that have rolled along, the busy bee has kept pace with the iron horse in her course toward the Western sunset, and today she gathers sweet nectar from the flowers that bloom from every hillside, valley, glen, and far out on the prairies, and the breezes are wafted to the home of the honey-bee from the shores of the Atlantic, the broad Pacific, and from the Gulf.

NOT A PROSPEROUS YEAR.

The year now rapidly drawing to a close has not been a prosperous one for our chosen avocation, and while a few of us have a goodly supply of the products of the apiary, the great majority are compelled to report rather light results. Following an unusually rigorous winter, a spring wet and cold, with a warm, dry summer, there is little else to expect save the complaint of light stores.

FOUL BROOD.

It is said that opportunities of some kind present themselves once in a lifetime to every man—to this, woman might be added—and to us the subject of foul brood has been the all-absorbing topic during the past season. While this disease has been thoroly discusst pro and con, yet when one comes to tackle it, or to have it attack him, it is quite another phase of the argument. In my experience with foul brood this season I have learned that it readily yields to the treatment in which the colony is, compelled to use what stores they have in their saes for comb-building, and that it is not necessary to destroy either hive, frames, or wax, as these may be so easily and thoroly renovated of all traces of this disease that in no case has it appeared in the apiary a second time after treatment.

RELATION OF BEES TO FLOWERING PLANTS.

The relation of the honey-bee to flowering plants is a subject of importance. Experiments made by the Government show the benefits of a thoro cross-fertilization of plants, especially of their own species. In-breeding was for a divine purpose forbidden, and in no case is this sooner to be observed than in plants and fruits. An All-Wise designer placed the nectar beneath the blossom for the sole purpose of attracting the honey and pollen gatherer thither for the purpose of cross-fertilization. Nearly all of our fruit blossoms are hermaphrodite—they carry both sexes within themselves—yet a great many are utterly incapable of self-fertilization, as in the apple, cherry, strawberry, and hundreds of others which I might name. In the strawberry, in order to produce a perfect fruit will require the separate fertilization of from one to three hundred, and the dark-green masses to be found in almost any dish of strawberries are only evidences of imperfect fertilization. In the raspberry and blackberry every little rounded mass has required the visitation of an insect in order for fertilization.

The need of bee-keepers is to get into closer touch with the horticulturist, to convince him that we are his friends, and that when our bees visit his orchard and vines, not only we but he receives a benefit directly therefrom. The experience of Senator G. W. Swink, of Otero Co., Colo., as stated at an informal reception given in the Apiary Building at Omaha, is in itself a whole chapter in favor of the honey-bee as a fertilizer of both fruit and flower.

In stating his case at that meeting, the Senator said that as he engaged in the business of melon-growing on the Arkansas, the crop was unsatisfactory. No blossoms that came prior to the little prairie sweet-bee produced fruit, the crop was late, the melons deformed. A friend suggested that the trouble was in fertilization, and advised the honey-bee as a remedy. Advertisements were inserted in Kansas papers offering a free location, and free board, to the party who would locate an apiary in Swink's melon-fields, and when I inquired the result, he said, "Why, more than four times the melons;" and now are located in those vast melon-fields more than 600 colonies of bees, and the famous Rocky Ford melons are to be found in every Western market. They fed the vast throng of people that visited the Trans-Mississippi for nearly a week last fall, including the bee-keepers of the United States Bee-Keepers' Association, who were present on that occasion, while the Indians lugged melons and danced until this Association was really in danger of being contaminated with the effects of the festive dance.

ADULTERATION.

Nothing that we have to deal with meets us so squarely in the face at this time as adulteration. Years ago Senator Paddock, of my State (Nebraska), took up the matter of enacting pure-food laws, but the adulterators rallied to its defeat in such numbers that it failed to pass. Congress has again taken up that question, and placed Senator Mason at the head of a committee whose duties are to make such investigations as are possible, and to report such laws as will best meet the cases in question. In a correspondence with Senator Mason I have pledged him the undivided support of 5,000,000 bee-keepers, and he assures me that of all the abuses honey appears to have suffered the most, and that it shall have a prominent position in the Bill which his committee is to report to the next Congress.

When I pledged him these 5,000,000 bee-keepers of the United States in support of a pure-food law, I realized fully what benefits such a law would bring to these producers, and would extend to perhaps 50,000,000 consumers. In order to make this support felt, we must ask our senators and representatives in Congress to support this measure; we must unite ourselves to the organization that will enforce such a law when enacted, and stand by it to the end.

The opportunity now presents itself for this Association to make its influence felt in this direction, but in order to do so there must be a unity of action, a banding together with this one idea of success. Differences must be dropt, especially so far as they relate to small things, and to gain this much-desired end it matters not whether honey is best South, East or West. The bee-keepers of the United States are confronted with an army of adulterators who are gradually bringing the product of the apiary into disrepute, and lessening the demand even for a pure article, for the reason that suspicion is being cast on every grade, and in many localities it is even asserted that comb honey is subject to adulteration. These mistaken ideas come mainly from the adulterators themselves, who desire to induce the public to believe that they are as good as the very best.

ADULTERATORS OF HONEY.

The suits instituted against the adulterators of honey at Chicago, under the pure-food laws of Illinois, have proven a failure from the fact that the law allowed the vendors to plead that they were not aware of the adulteration. The gun that isn't loaded is the most dangerous of all, and the bee-keepers of the United States will be compelled to rely upon national legislation rather than State laws in order to clean up this great army of adulterators who prey on the unsuspecting, and, when confronted in their nefarious work, hide behind some clause in the law to escape punishment by pleading ignorance. Prof. Eaton, who has analyzed several samples of adulterated honey at Chicago, states that out of the number analyzed but three were found to be pure, and the one upon which an action was based contained glucose almost entirely; not sufficient honey being used for flavoring. The law, remark Mr. Eaton, is about as good as no law at all, and when "ignorance is bliss" while engaged in vending beeless honey made from a cheap sample of glucose, dangerous to health, one of the most honorable and healthgiving industries of the United States must suffer. The experience with these adulterators should nerve the bee-keepers of the United States with a renewed determination to stand together until these abuses are stamp out, once for all.

THE BENEFIT OF DEFEAT.

There will doubtless grow out of failure some real benefits to the honey producer, inasmuch as all adulterators will fully understand that there are lurking in the woods and on the watch-towers those who are looking after their nefarious practices in deceiving the public, and who seized on the first opportunity to prosecute them. This will make them a little more cautious, and more samples will be branded with what they really contain, and more honey will be used in compounding adulteration. This is possibly worth to the Association all that it has cost, if not more.

THE UNITED STATES BEE-KEEPERS' ASSOCIATION.

This Association is not strong enough to have its influence felt as it should be felt. Memberships mean dollars, and dollars mean that which with your outside influence can and will be felt all along the line from Maine to Oregon, and from the Gulf away up into the British possessions. Every member of this Association ought to constitute himself a committee to secure the membership of his neighbors and fellow bee-keepers, until every live, wide-

awake man who manipulates the bee has been gathered in and is a member of this Association.

AMALGAMATION AND COMMENDATION.

There has perhaps never been room for more than one national association of bee-keepers, and this Association was organized at Lincoln, Nebr., with a view of uniting the whole in one strong association. But for reasons not necessary to state, there were differences which grew wider apart for a time, and the object for which this organization was formed in part has failed. I am happy to state that these differences are fast being dissolved, and that we are looking forward to the time when the two great organizations will be able to unite for the general good of both, and on a more elevated plan for bee-keepers, and the punishment of adulterators secured under such laws as have been past in the different States and such laws as may hereafter be past.

I take great pleasure in commending to your consideration the zeal and fidelity with which General Manager Secor has filled his office in this Association, not only during previous years, but during the present one. Secretary Mason, by his careful painstaking, and general courtesy, ever alert for the best interests of this Association, is entitled to a liberal share of your commendation, and I assure you that there is little else to be gotten out of the labors which have been performed by them, as well as the different members of the Board of Directors, who are likewise entitled to your commendation.

During the year Rev. E. T. Abbott has taken great interest in the National Pure-Food Congress, and has spent much time in attendance on the sessions of that organization, and with little expense to this Association. I doubt not but thru his efforts this Association has a standing among the advocates of pure food second to none in the United States. Our thanks are due the different members of the Board of Directors whose universal courtesy has been ever foremost in advancing the best interests of this Association.

E. WHITCOMB.

The president's address was followed by the following paper by Rev. E. T. Abbott, of Missouri, entitled,

Necessity of Pure-Food Legislation from a Bee-Keeper's Point of View.

I come to you this morning all the way from the Queen City of the West to talk to you about a subject in which I am vitally interested, and I trust I find you in a receptive frame of mind, to say the least, if not fully aroused to the importance of the subject.

Perhaps it is not just the thing to discuss the manner of stating a subject when it is given you by another, but I want to enter a protest against discussing pure food from the "stand-point" of any class. There may be special reasons why we, as bee-keepers, should throw our influence in favor of all such legislation, but all pure-food legislation should have in view the interests of the masses, and not the lowering or raising of prices for the benefit of special classes. It is the interests of the consumers that are to be looked after, and not those of the producers.

What we need is one national pure-food law which will cover all articles of human consumption for food and medicine. Perhaps it would be just as well to say human and animal consumption. The trouble with pure-food legislation in this country has generally been that those engaged in special industries have sought to have laws past for their personal benefit, and the reason urged, in many cases, for the passage of such laws has been that it would protect and raise the price of the product in which they are most interested. It is probably not necessary for me to say that I am opposed to all such legislation. It is vicious and contrary to the principles of a free government. Fairchild, in his Moral Philosophy, says: "A tyranny is a government which is administered for the pleasure or advantage of a class or of a few in opposition to the interests of the many." This is true of any law, whether it help a rich corporation or the so-called "granger."

The tendency to take narrow views of such legislation is so great that many find it hard to resist it. Two elements make themselves prominent. Our selfish interests so press themselves on our brain fiber that we find it hard to resist the temptation to ask that the legislation be so framed as to help our industry. Then, again, egotism is so prominent in our natures that we are apt to think that nothing is just as it should be until we have had a hand in making it. The result is we can see no good in a Bill framed by others, first, because it does not help "our folks," and second, because we had no hand in making it. As John Stuart Mill

suggests, we are apt to want men to act as we think they should, because of our personal feelings in the matter, and not because it will promote the public good.

The necessity for pure-food legislation is hardly a matter for discussion. Every man of ordinary intelligence, who has given the subject a moment's thought, knows that adulteration and false branding is rampant everywhere. Butter is adulterated, flour is adulterated, sugar is adulterated, tea and coffee are adulterated, honey, thrown out of the comb, is adulterated, spices are adulterated, syrups are adulterated, drugs and medicines are adulterated. In fact, almost everything we eat and drink is adulterated. Sometimes even the adulterant is adulterated. Chicory is a good illustration of this, for the man who buys it to adulterate coffee is not certain that he himself is not being woefully imposed upon by having some adulterant of the adulterant foisted upon him. In this case he gets beaten at his own game. Here is a list of the articles which are said to be used to adulterate chicory. (Before I give the list let me remark that this Government has laid a duty on chicory so the people of Nebraska can afford to raise chicory): "Roasted beans, peas, carrots, parsnips, acorns, horse-chestnuts, tan-bark, logwood, and even the livers of animals." And so it comes to pass,

"Larger fleas have lesser fleas upon their backs to bite 'em,
And these, again, have smaller fleas, and so ad infinitum."

Adulteration is open, flagrant, bold, and often *defiant*. It is the crowning crime and shame of the 19th century, and a matter beside which in importance all others pale into insignificance. It is more than expansion or anti-expansion; it is more than free silver or the gold standard; nay, it is more than any other question which confronts the American people to-day, for it is sapping the moral foundations of justice and equity, and teaching men and women, who are otherwise disposed to be fair, to wink at deception and dishonesty. Surely, it is time to call a halt.

I am a firm believer in the rights of the individual, and insist that none of his natural rights be curtailed or arbitrarily taken away in the supposed interest of society, but I am equally firm in the conviction that no man has a right to defraud and deceive his fellow men in the name of liberty. Cooley said, "It was the peculiar excellency of the common law of England that it recognized the worth, and sought especially to protect the rights and privileges, of the individual man. Arbitrary power and uncontrolled authority were not recognized in its principles." Legislators should ever have these foundation principles in mind, and should see to it that no individual right is infringed upon by the laws which they enact. So long as an article is not injurious to human health and happiness, the laws of the land should in no way interfere with its manufacture. The simple fact that the production of an article lowers the price of or cheapens another article is not a sufficient reason for throwing legislative restrictions about it. We were told a few years ago that a "cheap coat" made a "cheap man," but surely this is not true of food products. The masses are interested in cheap foods, and the only thing that I insist upon is that they be sold for what they are, and be not branded with a *lie*.

Much of the so-called pure-food legislation of the past has simply been a little "pap" thrown by the cheap-John politicians to the so-called "grangers" to catch votes, and the result has been that in many of the States some very foolish laws have been enacted, professedly in the interest of pure food, but actually in the interest of the party who introduced the Bill. The farmers were blandly told that they were entitled to higher prices, and that the so-called pure-food law would enable them to get them, and they were thus deluded into shouting and voting for the fellow who threw them this very thin "pap." Jefferson wrote in 1789, "The tyranny of the legislatures is the most formidable dread at present, and will be for many years." In the light of the acts of this, the year of 1899, we can see that he was clearly correct.

Take the pure-food law of Illinois as an illustration, and some of these incongruities will make themselves apparent. The Food Commissioner, a creation of the last legislature, is to have for his duty the enforcement of the laws now existing, or that may hereafter be enacted, regarding the production, manufacture and sale of dairy products or the adulteration of any article of food. Are not dairy products "articles of food?" If so, why place them in contrast with all other articles of food? Self interest! Here is the hand of some one who has more interest in one class of producers than in all other producers and consumers combined.

A similar so-called pure-food law was past in the State

of Missouri, which makes it a criminal offence to sell any article intended for human food which contains arsenic, calomel, bismuth, ammonia or alum a very good law, perhaps, if it had not been in the interest of some one's baking-powder. The same legislature let a duplicate of the Brosius pure-food law lie in the hands of a committee. Why did not the Illinois law specify honey or apianian products? Simply because the politicians have not felt the necessity of throwing taffy to the honey-producers as a class.

Let us away with this kind of nonsense; let us have done with this political jobbery; let us enact a national pure-food law in the interest of the consumer, and not for the benefit of any class of producers, let them be few or many. Let us as a nation declare that it is a crime to adulterate, to falsely brand, to sell anything for what it is not. If this lowers prices, let them go down. If it raises prices, let them go up. Any business that cannot live in the face of honest competition deserves to die. The honey-producer has nothing to fear from the competition of any article or compound that is sold for what it is, and does not carry a lie on its face. There is great need for education along this line. The moral sense of mankind must be awakened, and they must be made to feel that to knowingly sell falsely-branded or adulterated goods is to commit a crime, morally if not legally. I have here an illustration of such criminal work in the shape of a jar of so-called honey. It is labeled "Kellogg's Pure White Clover Honey, Medina, O."

I remonstrated with a dealer in our city about selling adulterated honey. He said it was nothing to him, that he would sell a man mud if he wanted it. I said, "So would I, but I would not sell him mud when he asks for honey," neither would I sell him two parts glucose and one of honey which some unscrupulous mixers had labeled "Kellogg's Pure Clover Honey," for *honey*; for it is not honey, and the man who labeled it honey knew the label was a lie when he put it on, if he ever thought enough about what constitutes a lie to understand the real facts in the case. To take a man's money for a mixture of glucose and honey when he asks for *honey* is obtaining money under false pretenses just as much as it is to give a check on a bank when one never had any money deposited there. They send men to the penitentiary for the latter; why should not the same penalty be inflicted for the former crime? Will some honest (!) mixer please rise up and explain?

There seems to me but one way to get at the root of this evil, and that is by a national law making it a criminal offence to adulterate or mis-brand any food or drug in any territory of the United States and the District of Columbia for interstate commerce or exportation, and then let each State pass a law of the same kind to reach the cases within its own borders. Of course, you understand that the United States cannot regulate the manipulation and sale of food and drug products in the various States of the Union, but it can control the matter in territories for interstate commerce, and when the goods are intended for a foreign market.

Now, what are the prospects of such national legislation as I have suggested? I may say, in a word, that the outlook for the passage of such a law is very good indeed, and the most important thing for us as bee-keepers and citizens of the United States is to see to it that our influence goes to help forward the work of securing the enactment of such a law, and that we do not waste any of our energies on side-issues gotten up to promote the political interests of some individual.

During the summer I have noticed a good deal said about Senator Mason and his pure-food committee. The Senator was reported to have said that great pressure was being brought to bear on him to get him to stop his investigations, etc. Now, I want to say just here, that I have not been quite sure that I knew why those investigations were instituted, or where Senator Mason got the idea that there would not be any Pure-Food Bill past by the next Congress unless he drafted one and pushed it thru. What is the use of wasting time and the people's money to prove the fact of adulteration? Why was it necessary to take Prof. Wiley, the United States chemist, half way across the continent to tell a committee what he knew about food adulteration? He had long before told all he needed to tell on the subject before an intelligent congress of some of the best citizens of the country, which congress met in the national capital, and whose proceedings had been published and were accessible to Senator Mason or anybody else. Why should the work of this body be ignored and a political junketing committee be created to prove the fact that food is adulterated? It is like spending money to prove the fact that the sun

shines, or that water does not naturally run uphill. Everybody who has given the subject a moment's thought knows that food and drugs are openly and wickedly adulterated, and the evidence of it can be found in any village or city of the United States. The main thing now is, to find a way to stop it, and I think this way will be found, even the Senator Mason should stop his fight in order that his son might draw the fat salary that one of the Chicago papers said he had been offered.

We do not need any new evidence, we do not need any new Bill, we only need that every lover of truth and common honesty go to work and see to it that the Pure-Food Bill which has the endorsement of the National Pure Food and Drug Congress, and which is known as the "Brosius Bill," becomes a law during the session of the next Congress. This Bill has the endorsement of some of the best men in the Nation, was carefully considered by the Pure-Food Congress Committee, of which I had the honor to be a member, and was then endorsed by the Congress as a whole, and I do not think there is anything to be gained by side-tracking all of this work in the interest of any man's political aspirations, let him be Democrat, Republican, Populist, or what-not.

I fully agree with Senator Cockrell, who said, when I suggested to him that possibly the Bill contained some crudities and objectionable features, "I am in favor of the Bill. Let us pass it, and make the corrections afterward." Our enemies would like to see us wrangle over amendments until the Bill is killed, but I very much mistake the temper of the men who compose the National Pure Food and Drug Congress, if there is any wrangling about the matter. These men are too much in earnest to split hairs about minor matters; once we get the law then we will make the corrections.

Now, I want to say a word to the members of the United States Bee-Keepers' Association and to the public generally about making this a personal matter. You may think you have no interest in the matter, but you have. Adulteration reaches every home, it blights and withers the prospects of every honest calling, and is no respecter of persons. As I said before, it is sapping the foundation principles of moral order, and every man, woman and child who believes in common honesty is interested in its suppression. Even the families of the adulterators themselves cannot escape the ruinous effects of this the crowning crime of the century. Let us remember then, to use the language of Mill, "A person may cause evil to others not only by his actions but by his inaction, and in either case he is justly accountable to them for the injury."

EMERSON TAYLOR ABBOTT.

Pres. Whitecomb's address and Mr. Abbott's paper were then discuss.

Mr. Abbott—Honey is two cents higher in Ohio than in Missouri. This honey, or imitation of honey, that I referred to in my paper, is made in Kansas City, Mo.

Question—Then do you mean to say that this honey is not put up by Root? (Laughter.)

Mr. Abbott—Some people are laboring under a mistake, and that is, that the United States has nothing to do with regulating foods. Congress cannot enact a law to prevent adulteration in Missouri, but as soon as the adulterated article moves out of the State then it can be handled. By the way, I have here copies of the Brosius Pure-Food Bill. I wish you would come forward and get them later. I wish I could speak to all the bee-keepers of the United States about this Bill. You may think that you have nothing to do with it, but you have. Adulteration reaches in every part of the United States.

Dr. Miller—There are thousands of people who have not given the matter a thought. The Pure-Food Congress has brought the matter before us. One point: I want a law made that will protect the market at Marengo. If I should make an effort to get legislation that will benefit only *me*, it will never be done. If we get anything done it will not be by legislation for any one point, but it will be when we get legislation that will benefit *every one*.

E. R. Root—It seems to me that there is not very much to be said about Mr. Abbott's paper, but I want to say that I endorse what Dr. Miller says, and I am interested in this bottle of honey. "Your sins will find you out." You know the city where this bottle of adulterated honey was put up, Mr. Abbott? Do you wish to give the name of the party?

Mr. Abbott—Bliss Company.

Mr. Root—Can you prove unquestionably that the Bliss Company put this up?

Mr. Abbott—I can.

Mr. Root—Why do they put Medina on it?

Mr. Abbott—I suppose they take the view that Medina is a honey center. Like all ignorant persons, they copy some one that they think is worth copying.

Mr. Root—I suspect that they were borrowing the comb-honey idea from comb foundation being made at Medina. But if there is any law in the country by which that firm can be prosecuted, and the stigma taken from the Root Co., we will follow it up.

Mr. Abbott—I owe a little explanation. The Pure-Food Bill was initiated by Senator Paddock. Mr. Brosius then talkt it up, and that is why it takes his name, and this Bill was drafted and prepared and turned over to the Senate. The House committee was ready to report favorably on the Bill. If you urge any other Bill you are not standing by the original Bill. If we ask for too much we will not get anything. We are going to pass this Bill without amendments. I have no objection to Senator Mason passing a Bill, but Senator Mason's Bill will not be a Pure-Food Bill. We say, pass the Brosius Bill. I will answer any question that anybody wants to ask. Go home and talk to your congressmen. I interviewed Mr. Cockrell about the Pure-Food Bill. He had never read it. I said, "These people are in favor of this Bill, and if you are not in favor of it off comes your head." I heard from him the next day, and he was in favor of it.

Dr. Mason—I would like to emphasize what Mr. Abbott says about waking up our congressmen. I went to our congressman and told him what we wanted, and he promised to support the Brosius Bill.

An Attendant—Probably he was a small man and was afraid.

Dr. Mason—He *was* a small man, but not afraid. He understands that his constituents are the "power behind the throne." He was already in favor of the Bill, but what I said encouraged him in its support.

Mr. Selser—I want to say that we have a pure-food law in this State (Pa.), and a good one. I don't know just the year in which it was past, but four or five years ago.

[Continued next week.]

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Losing Young Queens in a House-Apiary.

In reply to J. N. Alexander, page 622, I may suggest that his trouble in losing young queens in his house-*apiary* may arise from having a dozen entrances on one side of the building; many of them looking just alike. If he paints the side of the building in different colors, some white and some very dark, it will help. If, instead of having the entrances regularly two feet apart, he should put the entrances in pairs, say two entrances only six inches apart, then a distance of 3 feet 6 inches, then 6 inches, and so on, that would help. No danger that there would be confusion with two entrances only 6 inches apart, if there are only two entrances, for bees know right from left. It will be very helpful to plant a tree not far from the building midway of its length; even a post or a board would help. C. C. MILLER.

Arranging Hives in the Cellar.

I read of tiering hives in cellar-wintering. Does that mean placing one hive directly on top of another, or are they on shelves one above another? In other words, is it necessary to have them so as to remove the covers, giving access to the top of the brood-frames for examination?

PENNSYLVANIA.

ANSWER. No, probably no one tiers up his hives in the cellar and still has a chance to remove the cover from each

hive in the pile. Probably very few use anything like shelves. It would take a good deal of room with no corresponding advantage. One disadvantage would be that any jar to affect a single hive would jar every hive on the shelf. I suspect that even the uneasy buzzing of a colony might be communicated to the other colonies on the shelf, not at all to their advantage. Some tier up their hives in the cellar without any bottom-boards. The hives next the ground are raised so there is a large open space under them, and they are sufficiently wide apart so the next tier can be properly piled on them. Each hive of the second tier rests on two hives of the first tier, one side of the hive resting on one hive and the other side on another. The space between the hives is so large that nearly all the underpart of the hive is entirely open, giving unlimited lower ventilation. Another way is to have deep bottom-boards which leave a space of two inches under the bottom-bars. A hive is raised a short distance from the bottom of the cellar, on this is placed another directly over it, and so on till four or five hives are in the pile. Each pile is entirely separate from the other piles, so that if one hive is jarred it can only jar three or four others. After trying this last plan for a number of years I like it much. The hives are pickt up from their summer stands and carried in, bottoms and all, and the same thing when they are carried out.

Supers on First Swarms—Fall Management, Etc.

1. Is it advisable to place supers on swarms the first summer? If so, at what time should it be done?

2. When the queen has moved into the extracting-super and turned it into a brood-chamber, what should be done in the fall about extracting?

3. I have noticed on some leaning hives that an oily or greasy substance exuded from the lower corner. What does that indicate? UTAH.

ANSWERS.—1. Most surely it is desirable to put supers on swarms the first summer. If your bees swarm as much as some bees do, the main part of your surplus will be from the swarms of the current season. Indeed, a great many depend almost entirely upon these, counting that the mother colony will do well enough if it builds up strong for winter. The swarm is placed on the old stand, the mother colony close beside it, the latter being removed to a new stand six or seven days later. That throws *all* the storing-bees into the swarm, leaving the mother colony weak.

2. It isn't so much what is to be done as what is not to be done. And the chief thing in such a case is *not* to leave the colony without abundant stores for winter. The thing to be done is to get into one chamber all the frames with brood, and the temptation in that case is to take too many of the combs for extracting. That's on the supposition that the frames in the extracting-super are of the same size as those in the brood-chamber. If the frames in the super differ in size from those in the brood-chamber, see that the queen is in the brood-chamber, and then put a queen-excluder between the two, thus making sure that within three weeks, at least, there will be no brood in the extracting-story. The better plan is to have the excluder there all thru the summer, then there will be no danger that the queen will get out of her proper realm.

3. I don't know, unless it might be pitch from the pine wood of the hives, or perhaps more likely the bees of the colony are great on bee-glue, and the overplus runs out on hot days.

Preparing Bees for Cellaring Queen Questions—Queenless Colony.

1. Heretofore, in putting my bees into the cellar, I have stopt them up carefully so that they could not get out while being removed, then when they were all in and became quiet, I pulled the stopping out and quietly raised the front of the hive about an inch. Now comes A. I. Root and recommends lifting off the bottoms and putting them on scantling. I have never tried the plan, but would they not in lifting them off the bottom-boards and then putting them back in the spring in each case, arouse the bees up and cause them to fly out, and get scattered and many of them lost?

2. I have in the past kept empty supers on my hives in winter, partly filled with old cloths. Would they do as well to put the cover right on the body of the hive without the super? Would they not be likely to accumulate moisture

in the hive in that case? I don't like to experiment, but would rather profit by the experience of others.

3. Would it be safe to destroy all queen-cells on the eighth day after casting a swarm and insure a queen?

4. Is the piping heard before a second or after-swarm issues, done by a hatch queen or an unhatched one?

5. I have a colony that is queenless and has been so for over a month, and has a laying worker. If I unite it with another colony would they be liable to destroy its queen? It is not very strong with bees. I have thought of shaking its bees out upon the ground and let them look out for themselves, as all my other colonies seem strong enough without them. Would you think it the proper thing? Iowa.

ANSWERS.—1. There is not such a great deal to choose between the two plans. The objection to your plan is that the bees are stirred up and excited with the shutting in and the jarring, and it is better to leave them quiet after their last flight. If no pains are taken beforehand to raise the hives from the bottom-boards, the Root plan will find bees on the bottom-board with strong colonies. If the hives are raised beforehand, and left raised long enough, the bees will all be off the bottom-board in the hive. If the bees are quietly carried in there is no need of shutting them in the hive. My hive bottom-boards are two inches deep, so the hive is closed at the back and sides, with an entrance two inches deep the full width of the hive. The bees are carried into the cellar without shutting in, preferably on a cool day only a day or so after they have had a flight, and there is no trouble about their leaving the hive.

2. It may be that they will do a little better with the cloths if you don't object to the trouble.

3. No; there might be no queen out of the cell till after the eighth day. It would be safe to destroy all cells after you hear piping.

4. When the first young queen emerges, she travels about over the combs piping at intervals, making a rather shrill sound easily distinguished from the other noises in the hive. In reply the queens yet in their cells emit a coarser sound, seemingly more hurried in their utterances. This last is called "quabking," altho it is also called piping.

5. It is now known that not merely one laying worker is engaged in mischief, but a large number in the same hive. If you unite a colony having laying workers with one having a queen, there is no especial danger that the queen will be injured. It matters little what you do with the bees of a weak colony having laying workers. They are old, and if united with another colony will hardly live thru the winter. It might be economy to have them die now, rather than to consume part of the winter stores before dying.

ain't any plant-secretion, and the heavenly feller knows there ain't neither one. However, it is legitimately to the point that Mr. Parsons had some honey-dew honey that gave the best satisfaction to the consumers.

FOUL BROOD AND PICKLED BROOD.

That frame of foul brood (page 545) is as natural as—death. Mr. France, as an inspector, seems to be free from dangerous eccentricities of carelessness—a great mercy in a public officer of that sort. I see he also edges in decidedly toward the view that pickled brood is a form of starvation. Say rather that it is a distinct germ disease, but a disease that never does much harm except when (from scarcity of pollen or something else) *the brood are first in a half-starved condition*. Human beings, after being kept in a half-starved condition long enough, die off like flies of pretty much any epidemic that happens to come along, when few or none would have died had all been well fed.

A NON-ROASTED TATER.

Very suggestive is that little editorial good-bye to Cogitator, page 569. What a deft air of "good riddance of you," which nevertheless keeps clear of actually saying anything that the luckless wight could complain of! Ah, these editors! Now then, I feel compassionate toward the poor fellow—

Why drop thy foliage or flee,
Poor Tater, no man roasts thee?

THIN SECTIONS OF HONEY—SKIN-FLINTY BEE-KEEPERS.

I was almost tempted to laughter by the experience of F. W. Hall, page 574. The stingy fad of continually pinching the sections thinner is running against a stump. In too thin a space the bees get all on one side of the foundation and bend it far out of plumb. Then your extra-fancy honey is nice on one side and bare bones on the other, and not salable at all. Some bee-men are that skin-flinty that their souls look just like that on both sides.

HOT STONES FOR BEE-HUNTING.

Honey on hot stones for bee-lure, and same stones utilized to keep up a warm and fragrant areola around the bait and baited bees. Excellent kink in bee-hunting, one would say—if not too laborious. Samuel Varner, page 573.

PREFERENCE AS TO HIVES.

Of the 30 senators just half favor the Langstroth hive. But as to the sub-variety—whether the "Sweet little Minnie" or the "Large-hearted Polly"—the more part seem too bashful to express their affection right out in public. Minnie has three out-spoken lovers and Polly has four. No other hive than the Langstroth gets any large following. Seven of the non-conformist 15 favor hives of their own devising. Of the whole 30 the T super gets a mention from five, and the section-holders from three—super part of the question being ignored by the most. Opening article on page 561 chances on part of the same topic. Yes, Dr. Getaz, our colonies *are* too small in the spring (we Minnie-lovers), but still you don't grasp our real disease—mind so diseased that we can't believe they would open spring any stronger if we should go over to Polly.

A SWARM-CARRYING BICYCLIST.

O thou policeman, curse thy natal day!
Don't see that scorcher look some other way.
Touch him, as over broken bones he flees,
And he'll let loose on thee his sack of bees.

Even if he rides en-pajamas by so much the more it won't do to meddle with him. See page 570.

THE PUZZLE BETWEEN DADANT AND TAYLOR.

That puzzle of Dr. Dadant vs. Dr. Taylor, on page 570, I would solve thus: If the bees merely *spare* the virgin queen, but in their hearts do not accept her, then they will build drone-comb or none. If she is heartily accepted they will build no drone-comb unless they want some for other reasons. I don't know how it actually is, but I should rather expect an old colony, beginning to wish to supersede their queen, to change over from worker-comb to drone.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

LEVELING DOWN BAIT-SECTIONS.

Yet another "t'other way" to level section-combs for baits without the Taylor machine: Dip them in ice-water, and scrape them right down with a blunt-ended knife. Guess it will work all right; and the apparent raggedness of the job probably counts little or nothing. B. T. Davenport, page 547.

HORSES AND COWS EATING SWEET CLOVER.

What has been done can be done again—so I guess if Mr. Boardman's horses and cow ate the sweet clover, big stalks and all, other folks' horses and cows might be graduated in the same "ology" with proper tuition. Page 546.

THE ORIGIN OF HONEY-DEW.

On page 546, Mr. C. C. Parsons goes it strong against the "bug-juice" fellows. "We'uns," the guilty parties, are listening, and letting his stripes have all the redeeming power they are capable of upon our dirty hides. Powerful "curis" how the plant-secretion feller knows there ain't any "bug-juice," and the "bug-juice" feller knows there

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. OCTOBER 19, 1899. NO. 42.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Section-Cleaning Machines.—What has become of them? For a time their name was legion, and sections were to be no more scraped by hand. Now, when the time of year for scraping sections has again come and gone, no word is heard about them, and not a single section-cleaner offered on the market. Is Yankee ingenuity to be baffled by such a little thing as a section-cleaner?

Poet Bee-Keepers.—Editor Hutchinson says it is pleasant to know that we have in our ranks both a poet (Hon. Eugene Secor) and a composer of music (Dr. C. C. Miller). Please don't forget Mr. H., that altho Mr. Secor has done such fine service in writing bee-keepers' songs, he is not our only poet. Will Ward Mitchell has written much poetry for the Progressive Bee-Keeper, and that of no mean order.

Poisoned from Inhaling Boiled Bees.—Mr. Thomas Elliott, of Cook Co., Ill., writes the following account of a serious experience he once had when rendering a lot of combs from colonies that had starved:

Some three years ago I boiled down the combs from 150 hives in which the bees had starved out during a dry spell in California, and there were a great many dead bees in the combs. I used the extractor-tank out-doors, and it took me two days. From that time on my health failed. I can best describe it by saying that in one year I had become 40 years older. Every sense, feeling, or organ, in the human body that can be affected came under the influence of the poison. I was in a manner paralyzed, and the doctors told me that I could live but a short time.

But I found a doctor in Chicago who had the disease

described in a book, and under his treatment I recovered. I then knew for the first time what the trouble was, and had I not found this man I would never have known what ailed me. I have known a number of cases like mine, but they never knew what the trouble was. One feature of the disease is that it runs its course in from one to three years, leaving the patient as well as before.

In boiling down the combs it distilled the poison out of the bees, and as I worked over the tank I absorbed the poison into my system.

I want to say to bee-men, Don't boil a dead bee, or a live one, for that matter; you might be sorry for it.

THOS. ELLIOTT.

Have any of our readers been affected as Mr. Elliott describes, after inhaling the steam or odor from boiled combs and bees when rendering beeswax? If so, we should be pleased to know it, as no doubt would also many others.

Is Honey a Luxury or a Necessity?—At Philadelphia some thought people would buy honey as a luxury, if it was low in price; others thought we should teach it is a necessity, not a luxury. In the Bee-Keepers' Review Editor Hutchinson says:

"As a rule, I think that people buy honey because they want it, and that they care very little whether it is called a luxury or a necessity. It is possible, however, that some people would buy it who do not use it, if they could be convinced of its healthfulness—they might then look upon it as a necessity. To accomplish this is the work of the honey-leaflet."

Bee-Keepers Who Injure the Honey Market are still being heard from. A good sample of how a certain honey-producer did was reported to us the other day. He probably is one of the deluded kind that think it doesn't pay to take and read a bee-paper. He sent two barrels of honey to a Chicago commission house to be sold. A representative of the firm called on a honey-user and said his concern had two barrels of honey they wanted to sell, but was told that no more honey was needed just then. "Well, make me an offer, anyway," was the reply. The honey-user said altho he didn't want it just then, he'd give 25 cents a gallon for it! He got the honey because the commission firm didn't care enough about it to try to get what it was worth.

Two cents a pound for honey that was worth at least seven cents! And how much did the producer get out of the two cents after deducting commission, freight and cartage? Surely, no reader of a good bee-paper these days would be such a fool as to send his honey to a firm like the one mentioned. It pays to read bee-papers.

Following the Grand Army.—Dr. Miller says this in Gleanings in Bee-Culture about holding the annual national bee-keepers' convention in connection with the Grand Army meeting:

"Following the Grand Army with the United States Bee-Keepers' Association convention has its disadvantages, but they are far outweighed by the one distinct advantage of low railroad fares that cannot be so surely counted upon at any other time. By all means, let the settled policy be to follow the G. A. R."

Then Editor E. R. Root follows with this footnote:

"The only objection that can be urged against following the Grand Army is the inconvenience at hotels, and the general crowd. But we had none of those troubles at Philadelphia; and I think that, in spite of that, Chicago, our next place of meeting, will be big enough not only to entertain the Grand Army, but the members of the United States Bee-Keepers' Association, or what may then be the National Association."

The executive committee of the Chicago Bee-Keepers' Association expects to make arrangements for caring satisfactorily for those attending the convention next year in this city. But they can't do any better than did the Philadelphia bee-keepers, we are very certain.

Cash vs. Commission in Honey-Dealing. -At Philadelphia, commission men got their usual share of attention. Referring to this, and to the idea expressed by some that a commission man might win favor by abandoning the commission plan and paying cash, Editor Hutchinson, of the Bee-Keepers' Review, wisely says:

"This is probably true, but it must not be forgotten that, in the very nature of things, such a dealer could not afford to pay as high prices as might be secured by the commission man. If a man furnishes his own capital, and takes the risks of business, he must have pay for it."

Dr. Miller, in a "Stray Straw" in Gleanings in Bee-Culture, has also a good word for the commission man, as follows:

"Commission men are getting the worst of it nowadays. All right, brethren; but them over the head all you like; but wait till a year comes with big crops and no offers, and you may be glad to have a commission man work for you. I've seen the same thing in years gone by. A scarce year brought into the field many purchasers. Then came a year of plenty, and with few exceptions they dropt right back again into the ranks of commission work, pure and simple. See if it isn't so again."

Editor Root then adds his comment to what Dr. Miller had to say on the subject:

"I'm not one of those who believe that we can dispense with the services of the commission men just yet. Indeed, I do not see how we ever can. But if we can induce more of them to do business on cash basis it will do away with some of the friction we find here and there."

We can't quite see how a commission man would be a commission man any longer after he begins to do a cash business. But perhaps Editor Root's "locality" differs from Chicago. We still favor the cash business, and never expect to handle honey on a commission basis. Does the A. I. Root Co. handle honey on any other than a cash basis? If that has been their method for years, why cannot all other dealers do likewise? We believe they can.

MR. GEORGE POINDEXTER, of DeWitt Co., Ill., one of the exhibitors in the apiarian department at the Illinois State Fair last month, called on us Oct. 7, when visiting his son and daughter who live in Chicago.

MR. JOHN H. MARTIN, of Los Angeles Co., Calif., writing us Oct. 7, said:

"There was a little sprinkle of rain in the interior yesterday. We are hoping now that we will get wetness, and a plenty of it, all thru the winter."

MR. F. L. THOMPSON, of Colorado, we learn, is making a tour of Utah, looking up the bee-keepers of that State. He went toward Salt Lake City on his bicycle until it broke down on the desert, when he had to finish the journey on the train. The yield of honey in the region of the above city was about a quarter of a crop, we understand, and it was sold at from 10 to 11 cents per pound for comb honey, and 5 1/2 to 6 1/2 cents for extracted.

THE COLUMBIA INCUBATOR CO., of Delaware City, Del., is the successor to the Von Culin Incubator Co., of that place. We understand that the incubator offered by the Columbia people is one of the very best on the market, and is "sold on trial," guaranteed perfectly satisfactory in every respect. We don't know what more can be expected. Better send for a catalog, and mention seeing their advertisement in the American Bee Journal.

MME. MODJESKA was not only a famous actress, but also a successful bee-keeper, as per the following item in the British Bee Journal some time ago:

"A letter from San Francisco, in the Berlin Tagliche Rundschau, gives an account of Mme. Modjeska, in her present character as a California farmer. She has a ranch at the foot of the Santiago Peak, where she owns large flocks of sheep, from which she derives a comfortable income, and she includes amongst her stock 500 splendid Angora goats. Her great delight, however, is her prosperous bee-culture, for which she has acquired a wide renown. She owns over 700 colonies, and the honey is declared in the neighborhood to be the best in the world. Mme. Modjeska rises every morning at 5:30, visits her stables and cattle-sheds, and makes the round of her bee-hives; then she mounts her horse, which she bestrides after the masculine fashion, and gallops across her fields to see that everything is in proper order. She finds the actual shepherding to be more laborious, but more pleasant, than the part of the jeweled and ribboned shepherdess *a la Watteau* behind the footlights."

We do not know whether the lady still has her bees, but we presume she has not given them up. Perhaps some of our California subscribers know.

HON. EUGENE SECOR, General Manager of the United States Bee-Keepers' Association, spent Thursday, Oct. 12, in Chicago, when on his way to his Iowa home, from attending the annual meeting of the National Farmers' Congress which met in Boston early this month. Mr. Secor reports an unusually pleasant time among the historic things and places in and near Boston. The farmers' meeting was held in old Faneuil Hall, famous as the gathering-place of our forefathers when preparing the way for the freedom of this nation; and later again made sacred by the eloquence of Wendell Phillips and other great orators who were glad to be permitted "to spend and be spent" in the cause of freedom for the colored slaves. Then Mr. Secor stood on Plymouth Rock, and "shed tears over the graves of the fathers of our country." He visited the old battle-fields of Lexington and Concord, and other places of great interest. Mr. Secor was a delegate from Iowa, and has now attended four meetings of the Congress. Last year it was held in Texas. We know of few bee-keepers that travel as extensively as does our General Manager, and who seemingly enjoy long railroad trips as much as does he.

MR. JOHN CARSON, of Newton Falls, Ohio, aged 65 years, was stung to death by honey-bees. It seems that recently he was afraid of his bees, and burned some sulphur to render them harmless while he worked among them. Instead of dazing the insects the fumes of the drug infuriated them, and they swarmed about his head and face stinging him in innumerable places. Burning with intense agony he reeled into his house, fell unconscious upon the floor, and expired within a short time. He was an old resident. We always consider it safer to be protected with a veil when fooling around bees. There is scarcely ever any excuse for not having the face protected as it should be. One of the best veils costs only 50 cents, and why any one should risk his life for so small an amount is more than we can understand. A sting on the hand seldom results fatally, but on the face or head it occasionally does. It pays to be on the safe side by wearing a good veil when doing anything with bees that wear stingers.

New Edition of A B C of Bee-Culture. -We have received a copy of the new (1899) edition of "A B C of Bee-Culture," by A. I. Root, and just revised by Ernest R. Root. It is indeed a fine work, very interesting descriptions of which have been given on pages 603, 619, and on page 635 of this number of the Bee Journal. It is a book that every bee-keeper should own, and read thoroly. The regular post-paid price is \$1.20, but to all our subscribers who pay any arrears that may be due, and also \$1.00 for the Bee Journal for 1900 (next year), we will mail a copy of A B C of Bee-Culture for only 75 cents, provided the order is received before January 1, next. We make this same offer to all who have paid their subscriptions to the end of 1899 - send us \$1.75 and we will mail you the book and credit your subscription for 1900. We make the same offers on "Langstroth on the Honey-Bee," revised by Dadant (1899 edition).

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------------|-----|--------|--------|--------|
| Sweet Clover (white) | 60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | 70c | 1.25 | 3.00 | 5.75 |
| White Clover | 80c | 1.40 | 3.00 | 5.00 |
| Alfalfa Clover | 60c | 1.20 | 2.75 | 5.00 |
| Crimson Clover | 55c | .90 | 2.00 | 3.50 |

Prices subject to market changes.

Add 25 cents to your order, for cartage, if wanted by freight.

Your orders are solicited.

BEEDOM BOILED DOWN.

The Hive Question is in the practice of bee-culture undisputedly the most important and the weightiest, says Gerstung. Perhaps Whitcomb and Gerstung could make some sort of a compromise.

Breeding for Business.—Editor Root says, and says very truly: "If we can get up a rivalry between the queen-breeders of the country, so that they will strive for *business* instead of *color*, we shall have something that will put dollars into the pockets of bee-keepers."—Gleanings in Bee-Culture.

A Quiet Time.—Stenog says in Gleanings in Bee-Culture: "Between a very bad season and preparations for the Philadelphia convention, world-changing events in apiculture are scarce. Old standard subjects, such as wintering, size of hives, etc., are thrashed over with some vigor, but things in general are quite monotonous."

Apis Dorsata.—A Hollander by the name of Verholen, for several years, with the most tenacious pertinacity, tried in Java to domesticate the big Indian bee, but all in vain. Eighty-seven different colonies were captured and hived, but every single colony deserted their brood and honey, and took their departure.—Wuerzburger Wegweiser.

A 'Swarm-Catcher' that requires to be placed at the hive entrance the moment the bees begin to swarm, as stated, would, we think, be of no service to bee-keepers in this country," says the British Bee Journal. Which raises the question whether the esteemed editors might not change their minds upon actual trial. Is not that exactly the B. Taylor swarm-catcher? and is it not considered to be of great service by at least some bee-keepers in this country?

Foul Brood and Foundation.—John H. Howard, in the British Bee Journal, admits that with the old process of dipping, as practiced by some, there is danger from foundation made from foul-broody wax, but with present-day plans there is none, and closes by saying: "In the interest of the craft, I therefore ask bee-keepers to send along their foul brood beeswax, notifying its source, and we will return it in foundation, in which it is guaranteed that foul brood germs no longer exist."

Bee-Hunting is the topic for considerable discussion in the last number of the Beekeepers' Review. The instructions are much the same as are generally given, the general idea being to find the direction the bees take from your bait, setting the bait farther along in that line until you get to or past the tree where the bees are, if necessary setting the bait out of the line so as to cross-line. With regard to seeing the bees at the tree, J. D. Beasley says:

"Never examine the body of the tree, but get the tree top between you and the sun and simply gaze thru it into space. If you see insects flitting about the branches you may suspect they are bees; and if they move regularly, as tho they meant business, you may be sure your suspicions are correct."

Editor Hutchinson refers to replies made in the American Bee Journal to the question of L. J. Clark concerning lining bees in a honey-flow. He does not seem to have much faith in the reply that bees will work on fresh honey during a honey-flow. "Possibly they will if the yield is light," says

GEORGE W. YORK & CO.,

or of any large dealer in bee-keepers' supplies.

THE A. I. ROOT CO.,
MEDINA, OHIO.

he, "but it seems to me that a man could make but slight headway hunting bees at a time when they will not rob; and that is when there is a good honey-flow." Neither does he think they can be lured from their drinking-places along streams of water. He mentions a brook where the edges of the stream were fairly swarming with bees after water at a time when little honey was gathered; but during a good honey-flow scarcely a bee could be found near the brook. He mentions an instance where a puddle of honey stood for days on hard clay soil in front of a hive, and not a bee touch it, being busy on basswood.

A New Basswood—Tilia Petiolaris.—The British Bee Journal is enthusiastic, as well it may be, over the discovery of a new linden or basswood tree—"lime" it is called in England—which is about three weeks later than the common linden, commencing to yield just as the ordinary linden ceases, practically doubling the length of the linden harvest. It is an exceedingly ornamental tree, annual growth strong yet pendulous; leaves large, dark green on the upper surface, silvery below. High priced, of course, owing to scarcity, but it may be well for bee-keepers to be on the lookout for *Tilia petiolaris*.

A Smaller Wax-Worm is reported in Gleanings in Bee-Culture by Dr. Miller. He says:

"I've read of a wax-worm smaller than the common kind, and within a week have seen it in two apiaries. It has no gallery among the cappings; indeed, I don't know that it has any gallery. Its presence is indicated by the wriggling of one or more young bees unable to leave the cell. Pull out the bee, and at the bottom of the cell is a worm about 1/2-inch long, slender and very lively. A sort of web is fastened to the young bee."

Two kinds of bee-moths are spoken of somewhat confusedly in the books, but in this country, at least in the North, bee-keepers have spoken as if there was only the one kind. The question is whether the Doctor has made a new acquaintance, or whether it is only our old friend (?), *galleria cereana*, in a different role.

Lazy way of Keeping Queens.—A Stray Straw in Gleanings in Bee Culture is as follows:

"A caged queen may be laid at the entrance of any populous colony during the working season, and the bees will cluster over the cage and care for the queen just the same as tho' she were inside the hive."—Bee-Keepers' Review. Two years ago I used a lazier plan than that. I threw a caged old queen at the foot of an apple-tree in the middle of the apiary. A few bees came and clustered on the cage, as they often will. Then I threw another old queen there, and in the course of a few days there were a dozen or so of them. They stayed there for weeks, thru rain and shine. An amusing feature was that, altho the cluster was never as big as my first, it swarmed very frequently (of course always returning), sometimes several times in a day.

The Origin of Honey-Dew. that ever unsettled problem, is up again in the Bee-Keepers' Review, J. O. Shearman and Adrian Getaz taking opposite sides. Mr. Shearman says it is secreted only after a rapid growing time is followed by a sudden change with cool nights, arresting growth; then when the weather gets hot again the honey-dew disappears, lice or no lice. Mr. Getaz thinks there has been a failure of careful investigation on the part of those who believe in honey dew without lice. To produce anything like nectar there must be glands. If you cut into a cow, you will get blood and not milk; the milk can only be where the glands secrete it. So there may be an exudation of sap elsewhere than where there are glands, but it will be sap, not nectar. A reason for the doubt about lice in all cases is that the lice may be high up and at the ends of inaccessible branches.

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 26 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now 1 and 1/2 miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc., Mrs. J. B. Ayers, Libertyville, Lake Co. Ill.

THE OPEN DOOR POLICY
sounds all right, but the open field had better have Page-Fence around it, with one or two Page-gates. Please mention Bee Journal when writing.

SAVE FEED.

Feed is fuel to the animal economy. It is burned up to supply internal heat. If it is heated (cooked) before it goes into the animal's stomach it saves that much fuel (feed). **Electric Feed Cookers** save feed, save money and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. One, two and three sizes. **Electric Wheel Co., Box 14, Quincy, Ill.** Please mention Bee Journal when writing.

BEE-SUPPLIES

Root's Goods, Root's Prices. LANGSTROTH HIVES, MUTH'S HONEY-EXTRACTORS, ETC. Muth's Square Glass Honey Jars are just the thing you want now to develop your home market for your extracted honey. WE carry a complete line of Root's goods and sell at their prices. TO PARTIES IN THE SOUTH we offer a saving in freight. Send us your orders and be convinced. Catalog for the asking. **C. H. W. WEBER,** Successor to CHAS. F. MUTH & SON and A. MUTH, 2146-48 Central Ave., CINCINNATI, O. 4044 Please mention the Bee Journal

"The aphides are of necessity always at the top of the trees or of the plants. If they were scattered all over, the excretions of the ones above would daub and smother the others."

"**A Bad Leak**" is what E. E. Hasty in *Gleanings in Bee-Culture* styles the loss that he thinks comes from the belief that prime swarms do not issue before 9 a. m. nor after 2 p. m. In a large apiary there is such a general roar throuth the day that the additional noise of a single swarm is hardly noticed unless the bee keeper is keenly on the watch for swarms, and he will not be keenly on the watch at a time of day when he believes no swarms will issue. So he thinks many a swarm leaves for the woods before and after the traditional hours for prime swarms. Of the last 6 prime swarms that issued for him, one issued at 9:30 a. m., two at 11 a. m., two at 3 p. m., and one at 4:20 p. m. He thinks it a good plan to make a careful search of trees and other clustering-places once or twice in mid afternoon, and again just before dark. Chopping down some trees and thinning out others would help to make the searching easier.

Won by Good Management.

During the past season I obtained from 54 colonies, spring count, 2,500 pounds of extracted honey, and increased to 74 colonies, but by good management I got it, as honey here is almost a total failure.

Our home of late has been cast into deep mourning, by the death of "Johnny," a bright little boy of 8 years, in which our hearts and pride rested.

MICHAEL MADDEN.

Russell Co., Ont., Sept. 30.

Poor Season in Vermont.

This has been quite a poor honey season in Vermont, being hot, cold, wet and dry. Basswood was no good in Vermont for the bees this year, and yet I never saw the trees, little and great, so full of blossoms.

Yellow Sweet Clover Seed!

We have it at Last!

We have finally succeeded in getting a **SMALL** quantity of the seed of the **YELLOW** variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in high. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium—

A Quarter Pound for Sending One New Subscription.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us **ONE NEW** subscriber for the *American Bee Journal* for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

GEORGE W YORK & CO.

118 Michigan Street, CHICAGO, ILL.

BEST WHITE ALFALFA HONEY

In 60-pound Tin Cans.

WE have been able to secure a quantity of WHITE ALFALFA EXTRACTED HONEY which we offer for the present at these prices, on board cars here in Chicago: Sample by mail 10 cents; 2 60-pound cans, in a box, 9½ cents a pound; 4 or more cans, 9 cents a pound. Cash with order in all cases. Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

My 50 colonies of bees gave me little over 1,200 pounds, a good share of it being fall honey. The honey is of good flavor and sells well at a good price.

My bees are in good shape for winter—plenty of honey and bees. Before they go to the cellar they will have oilcloth under the frames to keep the bottom-board clean. In the spring the oilcloth is taken out.

Skunks have been very troublesome this fall. I have caught a number, using steel traps at the front of the hives, hitching the trap to a long pole, and when caught they can be carried to the river and drowned.

To keep down increase I have the new swarm on the old stand with the parent hive by its side; the third day put all into the new hive from the old, minus queen-cells. I think I have a better way, and that is, to hive new swarms in supers filled with sections and starters, the number of supers being according to the size of the swarm. C. A. MARSH.

Windsor Co., Vt., Oct. 11.

A Light Honey Crop.

The honey crop is light here this year, and the winter stores of colonies will be very light. G. D. HAWK.

Sullivan Co., Tenn., Oct. 6.

Very Poor Season for Bees.

This has been a very poor season here for bees, about 75 percent of them having died last winter; then the spring was wet and cold, so they built up very slowly, and did not swarm any. I lost only about 25 percent, having mine well packed on the summer stands, and they will average about 25 pounds to the colony. S. J. MAGUIRE.

Benton Co., Iowa, Oct. 4.

More About Mr. Herman's Apiary.

On page 625 is an excellent illustration of Mr. F. G. Herman's apiary, in Bergen Co., N. J., but in the accompanying description his modesty has caused him to leave much unsaid. Living within a few miles of him I often have the pleasure of "wheeling" over to see his beautiful place, which is the neatest and most orderly of any it has ever been my good fortune to see.

Cleanliness and regularity are shown in all directions, the hives all in perfect alignment, every one as level as a spirit-level can make it, all nicely painted; the ground without a stone or even a spear of grass in sight; the honey-house supplied with every requisite, and everything in its place; smoker ready to light, extra veils for visi-

tors, and all appliances ready for use; and this love of order extends to the inside of the hives as well—every queen is where she ought to be, every brood-frame where it will do the most good, sections and supers always ready; and with a man running an apiary of 60 colonies as a side-issue this means not only a good deal of work, but work rightly applied, and in a great measure accounts for his success as a bee-keeper.

In all respects this apiary is one that might be taken as a model by many of us, as it shows that a bee-yard can be a thing of beauty to the eye, and at the same time show a good, substantial result at the end of the season. GEO. P. FRANKARD.

Bergen Co., N. J.

Small Honey Crop.

We had a small crop this year, but bees are in fine shape for winter. From 24 colonies I increased to 31, and got about 600 pounds of comb honey. I hope to do better next season. IRA CLAPPER.

White Co., Ind., Oct. 7.

Three Kinds of Cleome.

If Prof. Cook, who saw two kinds of cleome while traveling in this Arkansas Valley, had observed a little more carefully, he would have found a third variety, Lan-colata graveolens. JAMES H. WING.

Prowers Co., Colo., Oct. 4.

Queen-Rearing Experience.

On page 615, "Illinois" gets after Dr. Miller for not answering "Michigan's" question to suit him, as he seems to think the Doctor is holding back the truth to shield the queen-breeders' rascality. Now, I will give a little of my experience.

On July 4 I had 16 young queens to emerge from their cells, all as fine looking as one could wish to see. They were reared in a full colony, very strong in bees, as I made it up purposely, and I did not spare bees or honey as I wanted good queens.

On about the 5th or 9th day I saw one queen come in showing signs of being successful in mating, and in a few days she was laying, but would lay anywhere from the top to the bottom of the cell, and as I disliked giving her up I watcht her very closely. So one day, while holding the comb in my hand, I saw her drag off two eggs on the comb as she was walking along, apparently without being aware of it. Now I know this queen was reared in a strong colony with plenty of honey and pollen, but she kept on in the same way, about half or

A Feed Cooker for \$5.00

Many farmers and poultrymen have not used feed cookers in the past because they considered the price too high. To meet this case we have designed the **RELIABLE FEED COOKER AND WATER HEATER.** It is an ideal means for cooking food for stock or poultry and for heating water for scalding hoes. Made of best cast iron, with No. 22 galvanized steel boiler. 20 gal. size \$3—burns wood only. 50 gal. size \$12 and 100 gal. size \$18, burn either wood or coal. Don't buy until you get our free circulars. **RELIABLE INCB. & BROODER CO. Box 2 QUINCY, ILL.**

more of her brood being capt as drone-brood, so I pinch her head.

Now, I cannot tell the cause of it, but she simply could not manage the machine—it "just laid itself," and she could not control it. I might have been to blame for this, but it was not for the want of bees, I am sure.

One other of this lot of queens came from the cell on the 11th day from the time the cells were grafted, and was laying at 10 days of age. I kept her until I had a very good colony of drones, as fully two-thirds of her brood were drones. What is the matter with me? They were for my own use. **T. B. BOWNS.**

Milam Co., Tex., Oct. 4.

The Ontario Association's Meeting.

The executive committee of the Ontario Bee-Keepers' Association met in the city of Ottawa, Ont., Sept. 20, and set the date for its annual meeting for Dec. 5, 6 and 7, 1899, in the city of Toronto, and has arranged an excellent program. It is hoped that a grand reunion of bee-keepers from all parts of Canada and the United States will be held there, and all join in the discussions. No doubt that satisfactory arrangements can be made with the various railways for reasonable rates, and all persons interested in the production or consumption of honey are hereby cordially invited to attend.

Ontario, Can., Oct. 2. **W. J. BROWN, Pres.**

Nothing from Clover and Basswood.

The white clover promist a good yield of honey last spring, but, like last year, it gave us nothing. The linden trees were full of bloom with honey, but at that time it rained so much around here that my bees gathered very little of that. I must have lost thousands of my bees at that time by their venturing out in the drizzling rain, or being overtaken suddenly by a heavy shower, because my best colonies were reduced in numbers quite perceptibly when the linden bloom was over.

This fall was a little better than the summer; my bees workt quite lively for 3 or 4 weeks. They brought home enough for themselves to winter on and a little for their owner, but nothing to brag about.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th 1899 Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO. 118 Michigan St., CHICAGO, ILL.

PATENT WIRED COMB FOUNDATION

Has no Sag in Brood-Frames.

Thin Flat-Bottom Foundation

Has no Fishbone in the Surplus Honey.

Being the cleanest is usually workt the quickest of any foundation made.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apizry, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

ABC of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condense treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Oct. 7.—We have a strong market on all grades of honey, and while there is no perceptible advance in prices, they are well sustained. Fancy grades of white comb, 15c; and good grades, 13@14c. Amber, best grades, 11@12c; and off grades, 9@10c. Extracted, choice in flavor and body, and white color, 7 1/2@8c; light amber, same grade, 7@7 1/2c; off in quality and in color, 6@6 1/2c; dark and light body, 5@6c. Beeswax, 26@27c.

This is the most active month of the year for the sale of comb honey in this market.

R. A. BURNETT & Co.

KANSAS CITY, Sept. 14.—The supply of comb honey is very light. Scarcely any extracted on the market. We quote fancy 1-pound comb 14@15c; No. 1, 13@14c; No. 1 amber, 12@13c. Extracted, white, 7c; amber, 5@6c; dark, 4@5c. Beeswax, 26@27c. C. C. CLEMONS & Co.

NEW YORK, Oct. 11.—Good demand for all grades of comb honey and the same finds ready sale at following prices:

Fancy white, 15c; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 10@11c. Extracted, California white, 8 1/2c; light amber, 7 1/2@8c; white clover and basswood, 8c; choice Southern, 7@7 1/2c; and common, 7@7 1/2c gallon. Beeswax dull at 26c. HILDRETH & SEGELKEN.

CINCINNATI, Oct. 9.—The demand for honey, both comb and extracted, is very good, with prices much better than a few weeks ago.

Fancy comb finds ready sale at 15@16c; darker grades are hard to sell at any price.

Good demand for all grades of extracted. White clover and basswood brings 8@8 1/2c; amber and Southern at from 6@7c. Good demand for beeswax at 26c. C. H. W. WEBER.

Successor to Chas. F. Muth & Son and A. Muth. We do not handle honey on commission—we buy for spot cash only.

SAN FRANCISCO, Sept. 27.—White comb, 11 1/2@12c; amber, 8@10c. Extracted, white, 7 1/2@7 3/4c. Light amber, 6 1/2@7c. Beeswax, 26@27c.

Two shipments of extracted have gone forward to Europe since last issue, the ship Spring-burn carrying as part cargo 300 cases for London, and the ship Aristomene taking 100 cases for Liverpool. Market shows the same healthy tone as previously noted, with stocks of all descriptions of small volume.

ALBANY, Sept. 26.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6 1/2@7c; dark, 6c. Beeswax, 26@28c. MACDOUGAL & Co.

Successors to Chas. McCulloch & Co.

BUFFALO, Sept. 29.—There are virtually no arrivals of strictly fancy white comb honey. The very little arriving is poor, and the best of it brings 14 cents. We believe extra fancy would bring 15@16 cents, and any grade will sell well here. If receipts do not increase we may reasonably look for possibly higher prices. There is a very strong demand, quickly taking the few arrivals. BATTERSON & Co.

BOSTON, Oct. 13.—We quote: Fancy No. 1 white in cartons, 15@16c; A No. 1, 14@15c; No. 1, 13@14c. Extracted, light amber, 7@8c; amber, 6 1/2@7 1/2c.

But little new to note in this market on honey. The supply still continues to be very short while the demand is naturally a little lighter, as the retail trade is not quite up to higher prices, still with the light stock they must evidently come to it. BLAKE, SCOTT & LEE.

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14@14 1/2c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 8c. PEYCKE BROS.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

R. A. BURNETT & Co., 33A131 163 So. Water St., Chicago, Ill.

WANTED.—Fancy white comb honey in no-drip shipping-cases. State price, kind and quantity. C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth, 40Atf 214-8 Central Ave., Cincinnati, O.

CONTRIBUTED ARTICLES

A City Bee-Keeper and His Apiary.

BY WM. H. HORSTMANN.

I AM a letter-carrier employed in the city post-office, and find apiculture a very pleasant and instructive as well as profitable business in connection with my other duties.

In the photograph are my wife and one of my three sons, Herbert. His work about the apiary is to water the plants on the hives used to hold down the shade-boards, and watch for swarms. Herbert takes a great interest in the bees; and is sitting on the hive of the colony I gave him, it being the first swarm that issued last spring. Herbert was born here May 8, 1892, and is a splendid helper in the apiary.

I was born in Greenup County, Ky., March 14, 1859, came here when 18 years old, and started in the bee-business in June, 1897, by purchasing two colonies of bees from a neighbor. I increased them to 11 colonies in 1898. During the severe winter of 1898-'99, I lost six colonies, and during June and July of this year I increased by dividing and natural swarming until now I have 15 strong colonies.

My apicultural library consists of four books and four papers, the latter coming regularly as issued. I was surprised to find how little I knew about bees, after I started to read my bee-literature.

My wife was the first vice-president of the Chicago Bee-Keepers' Association; she also is very much interested in apiculture. Cook Co., Ill.

[The foregoing shows what a man can do with bees even when otherwise engaged especially if he has a good wife and helpful children.—EDITOR.]

Worms of the Wax-Moth in Comb Honey.

BY G. M. DOOLITTLE.

I HAVE had many letters of late telling me of worms in comb honey, and asking me to give my treatment for the same, in the American Bee Journal, which I will do, tho a little past the season when it would do the most good.

When honey is stored in a warm room, as it always should be, there comes a difficulty in the shape of the larvæ of the wax-moth, and unless this difficulty is headed off, it often results in quite a serious loss. I have yet to see the pile of 2,000 pounds of comb honey which does not have more or less of these worms or larvæ upon it, after it has been stored in a warm room for two or three weeks, altho, as the bees are becoming more and more Italian thruout the country, we see less and less of this wax-moth nuisance.

After the honey has been away from the bees about ten days, if we inspect the cappings of the honey closely we shall detect little places of white dust resembling little patches of flour on the combs, and usually the most abundant near the bottom of the sections. Now, altho this place may not be larger than the eye of a fine needle, still it tells us for certain that a tiny larvæ of the wax-moth is there, and that unless something happens to it to destroy its life,

Mr. Wm. H. Horstmann and Apiary, of Cook Co., Ill.

it will destroy more or less of the nice white cappings which incase our honey.

While in different cities a number of years ago, looking after the honey market, I saw sections of honey which had worms in them as large around as a slate-pencil, and an inch or more long; and altho they had nearly denuded the honey of the nice white cappings to the cells, still I could not make some of the grocerymen believe that the worms lived on the wax, they calling them "honey-worms." Such a spectacle soon disgusts customers, and injures the sale of comb honey very much.

If, after several examinations, you fail to find such little white, flourlike places, you need be very thankful, and consider you are favored much above many of our fellow bee-keepers. If you find these, the next thing is to sulphur your honey, as this is the only known remedy for these pests, except picking the worms off by hand, which is too slow where there are many of them.

To sulphur, I procure an old kettle and put some ashes in the bottom of it, so that there will be no danger of fire resulting from the heat from the coals which are to be placed therein. When I have the kettle thus prepared I take it to the honey-room and pour sulphur (which has been previously weighed) on the coals, to the amount of four ounces to every 25 cubic feet contained in the room, when the kettle is quickly pushed under the pile of honey, the same having been piled on a platform a little off the floor for this purpose, and the room closed. You will do this thing as expeditiously as possible or you will be apt to get some of the fumes intended for the worms, which is not very pleasant, besides depriving the worms of just the amount you carry off in your lungs.

I now go and look in at the window, to which the few flies which chance to be in the room will soon come to avoid the fumes, thus vainly hoping to escape their doom. As soon as I see that the last fly is lifeless, I take out my watch, and when five minutes have elapsed I open the window and the door to the room so the air will carry out the smoke as soon as possible, for, if allowed to settle on the combs it will give them a greenish color, which will be damaging to the sale of it. This same thing will also be likely to occur if much more sulphur is burned than the amount given above. It seems to be quite a nice point to have this matter just right; for if too much is used the combs are sure to be turned green; while if too little is burned the worms will not be killed.

The above has been arrived at after years of trial and experience.

If more honey is brought into the room after the first has been sulphured, this is also watcht, and when the marks of worms are seen on these, the same operation is repeated again, and so on till we are sure the honey passes from our honey-house without danger of these pests making an appearance after it has been placed upon the market.

All sections having cells of pollen in should be stored by themselves, as such combs are almost sure to be infested with eggs which will soon hatch into larvae, where there is any trouble from the wax-moth at all.

While on this subject it may not be amiss to say that I am not troubled nearly as much with these worms at the present time as I formerly was. And there are two reasons for this, according to my opinion: There seems to be a greater intelligence among the apiarists of to-day, and even among the small bee-keepers having only two or three colonies, along the line of not leaving combs exposed than the bees are off them, so as to breed these pests, as was done by our forefathers. And still more care in the years to come would nearly, if not quite, free our apiaries of this moth difficulty.

Hives of comb left standing in the apiary after the bees have died from them, as they nearly always used to be, will give moths by the thousand to be a nuisance in years to come. Care-taking by all in this matter will soon bring us to where no sulphur will have to be used, and such care should belong to every man, woman and child keeping bees.

The second reason is the one alluded to in the forepart of this article, namely, the Italian bee. In localities where only these bees have been kept for a term of years, the trouble has mainly become a thing of the past. Italians seem to protect their combs better in some way so that the eggs do not find a place in the hive, and in localities where there are no other bees kept, and where no combs are left exposed after the bees are off them, the need of sulphuring has become a rarity.

Onondaga Co., N. Y.

Foreign Matters—Uses of Honey.

BY "STENOG."

OUR French exchanges show a great amount of work in collecting information relative to honey and bees. Bee-keepers of that country, as well as of Germany, seem to be closely related to each other thru the numerous associations they have formed. If a new use for honey is found it is immediately printed and past around. Mr. J. B. Leriche, an eminent bee-keeper of France, has the following to say relative to honey; and altho some of it is familiar to most of us, it is a good plan to give it to those who may not have seen it before. I translate it from the *Revue Eclectique*, of Paris, one of the best bee-journals printed:

"Honey is a healthful, concentrated, easily assimilated food, offered to man by nature, all prepared, extracted drop by drop from myriads of flowers. Our ancestors made of it their favorite food. They knew no other sweet. The introduction of beet-sugar has lessened the use of honey, so the latter is hardly ever found now except in the home of the bee-keeper or in certain medicines, or on the table of a few who know its virtues. We should go back to honey, for it is well known that this food, without rendering necessary any insalivation or digestive work on the part of the stomach, excites nervous energy, gives mental force and tone to the vital functions, and is very beneficial to persons of sedentary habits or those doing much headwork. All those who suffer from disorders of the stomach, and who have difficult or bad digestion, or those subject to constipation, should use honey daily; and after several months they will find the digestive organs restored to their normal condition. But the use of it must be daily and prolonged.

"To live long, one should take, every morning, some hot milk, sweetened with a spoonful of honey, and dip bread in it. Taken at night, honey favors digestion and wards off sleeplessness. When Julius Caesar dined with P. Rumillius, to celebrate the 100th birthday of the latter, Caesar asked him by what means he had preserved his strength of mind and body. 'By eating honey,' replied the old Roman.

"But honey is not only a good food but a good medicine, curing, without drugs, disorders of the stomach, chest, and of the voice, such as gastritis, bronchitis, colds, asthma and grip. The formic acid with which it is impregnated by the bees makes of it an antiseptic, purifying the disordered mouth and breath. Rheumatism is practically unknown among those who eat much honey. But the honey must be pure; and one buying it should be sure of the standing of the house selling it."

In the same journal Mr. Drappier gives good directions for wintering, preparations for which he begins in September. The first thing to be seen to is plenty of food. By waiting later the cold is liable to prevent the bees from uncapping the honey; and uncapped honey before winter easily ferments, and may induce spring dwindling. One writer says bees can winter only on empty frames; but at the same time their honey should be so placed as to surround the cluster, and as near them as possible. He feeds from 30 to 40 pounds per colony. Altho bees use but little food in winter, he gives them enough so he will not have to feed in spring.

He advises against spring feeding, as it may induce an abnormal development of brood. The best colonies will be hived in September on a maximum of 12 frames. Will it be necessary to remove the empty frames? Mr. D. says he does not. Mr. Bonnier has shown that a filled frame is equal in value to a partition so far as preservation of heat is concerned. That is, empty frames, instead of taking away warmth, tend rather to conserve it. Besides, frames of comb in the hives are better protected in fall, winter, and spring, against the moth-miller, by the bees running over them, than the bee-keeper could do it himself. This is for large colonies. Small ones run all kinds of risks. The existence of drones in a hive in September is presumptive evidence of queenlessness. Hives in the open air should be well protected on top. All cracks should be plugged up. Repaint covers, if necessary, so that not a drop of water can get thru.

These foreign journals give a vast amount of advice to those who must be beginners in bee-keeping. Every month has its detailed account of what to do and how to do it. In this regard they set a good pace for American journals. It might be remarked, too, that the foreign journals draw more from sources outside of beedom than do those of America; and there seems to be a more intimate touch between the government and the various bee-associations there than

here. We get some ten French and German bee-journals here, besides one Spanish and one Italian. The French in particular are very interesting. Their printing is extremely accurate, an error being almost unknown, which remark applies to all the foreign journals I have seen.—Gleanings in Bee-Culture.

Concerning Bee-Repositories for Winter.

BY C. P. DADANT.

I WAS just preparing to write an additional article concerning bee-repositories for winter, when I noticed, on page 62b, the article by Wm. M. Barnes, whom I know to be a practical bee-keeper, and I would suggest that those readers who are interested in this matter re-read his statement. I do not believe that I would build exactly as he has done, and as he kindly invites criticism, I will state where I would suggest changes, but I take notice that he reports success, and this is sufficient to give his cellar a good point. As I said before, the proper temperature is the main need, tho a moderate ventilation and good, dry quarters are also important.

Mr. Barnes very probably had good reasons for building his stone wall only part of the way down. But if I were building I would build the entire wall of stone, or all of dirt. If the spot is dry, and there is no danger of any leak, a dry earth wall boarded up and left slanting outward to prevent caving in would certainly be the most economical and the quickest built. But if there is danger of any moisture, the earthen wall will prove annoying after a few years. My experience with a cellar-wall placed like that of Mr. Barnes, above the level of the cellar, is that it will, in the course of a few years, cause the dirt to settle, and will eventually be deteriorated thereby. So I would say, make all stone or no stone.

His cellar entrance is good. Double doors, when connecting with the outside, are a necessity.

Mr. B. does not say how the ceiling above is made. It is probably a double floor with sawdust between the joists. If the cellar is all made of earth, it would probably be cheapest also to make the ceiling of earth in a method similar to that used in most of the Western storm-caves, and commonly used for keeping milk or vegetables. If the frost can be kept out it will not be difficult to cool the atmosphere of the cave by a little extra ventilation when needed.

A window or two might be made, with double window-frames a foot or more apart, and the space between the two filled with straw. It is necessary that the cellar be fixt so one may readily enter it without disturbing the bees or causing much change in the temperature. This is only so that the bee-keeper may be enabled to ascertain the exact conditions.

As a rule, our bee-keepers are not over-supplied with ready cash, and it will very often happen that the cheaper cellar will be decided upon. But if I were to advise, I would rather recommend the stone-wall cellar, for two or three reasons, the most important of which is its durability. Then a stone wall is more easily made rat and mouse proof. A cellar, dug in clay, will probably be free from vermin for a year or two, but in the course of time it will become more and more unsafe in this respect.

I could not sleep well, winter nights, if I knew that my bees were housed in a cave or a room in which either mice or rats congregated in any quantity. Their depredations might not do much harm to the bees directly, but they would be sure to disturb them more or less, and by this means cause a greater or less number to become restless and wander away from the cluster. Combs that were not covered by the bees would be more or less gnawed by them, especially if they contained honey, of which mice are very fond. With a good stone wall, and a well-made double floor above, it is not difficult to have a rat and mouse proof cellar if the sills have been carefully laid in a bed of cement. Such a cellar would last a lifetime.

The cellar or cave need not be large. The hives may be piled four or five in a tier. We usually take them without bottom or cap. Our hives are all supplied with straw mats over the frames. In the summer we have an oilcloth or enamel-cloth between the brood-combs and the straw mat. In the winter the enamel-cloth is removed, and the straw mat is laid directly over the frames, and this straw mat is quite sufficient to separate the hives that are piled upon one another.

We set the first hive on the floor, or on timbers, for support, a little above the floor. This first hive has its own

bottom-board, but is slightly raised, or if the bottom is nailed fast, as much ventilation is given as the entrance will allow. The other hives are then piled on top of this with only the mats between the different brood-chambers. In this way a hundred hives may be placed in a very small compass.

The time best suited for removing the bees to the cellar cannot be given exactly, but only approximately. It must vary according to the latitude and the weather. In this latitude the first cold spell, after a warm day, towards the middle or latter part of November, has always proven the best. We want a cold day because the bees are less apt to fly about and worry the operator; and we want this to be as nearly following a warm day as possible, because on that warm day the bees have had a chance to empty their bowels and feel fresh and yet quiet. The longer you wait after the weather has turned cold the more chance there will be of the bees having begun to eat and load their abdomens with food. When they are once confined in the proper repository, their consumption is exceedingly limited, and they can stay month after month without stirring, if the food that they do consume is of good quality.

The entire winter problem may thus be summed in a very few words: Have good, healthy food, an even temperature, quietness, and a fair amount of ventilation, and your bees will come thru in good order in the most rigorous climate.

Hancock Co., Ill.

Uniting Weak Colonies in the Fall.

BY MORLEY PETTIT.

WEAK or queenless colonies may be united in such a way as to make strong queened ones. There are various conditions which render this necessary.

A colony preparing to swarm builds a number of queen-cells and rears young queens. When these are within a few days of hatching, the swarm issues, accompanied by the old queen. Of the queens that hatch, the one which becomes queen of the "parent" colony takes her mating-flight and becomes impregnated. The parent colony is left quite weak by the departing swarm; but if this happens in the honey season it is soon repopulated by the progeny of the young queen. If, however, the swarm issues late, very little breeding is done, and we have a young queen in a weak colony. Many claim these late queens to be the best layers for the following season.

Queenless colonies usually become so during the mating of the queen. A cold wind may keep her at home and hinder her mating or prevent her return to the hive if she does fly out. This, of course, cannot be avoided; but it points out the necessity of examining every "parent" colony before the end of the breeding-season to be sure it has a queen. The presence of a laying queen can easily be detected by eggs or very young brood in the middle combs of the hive. Again, the young queen returning from her flight may become confused and enter the wrong hive. To avoid this, the hives, if uniform and in even rows, should be interspersed with boxes or other landmarks placed every fourth or fifth hive, and projecting in front of the row.

When two colonies are to be united, go to them in the evening and remove half the combs from each. Leave the fullest and best-formed ones, spacing them to one side of the hive with a dummy, to separate the last one from the empty half of the hive. If they both have queens, find and destroy the poorer or older one. In 24 hours the bees will have discovered their loss and will be willing to accept a new queen.

The following evening carry the queenless colony and set it beside the other. Open each hive by removing the cloth or honey-board, using as little smoke as possible, and sprinkle the bees freely with sweetened water scented strongly with peppermint. Almost drench them. They fill themselves with sweet, the peppermint counteracts the distinctive scent, and the bees of two colonies mingle in one hive without stinging. Some advise smoking at the entrance and jarring before opening to cause them to fill themselves with honey; but this excites the bees and does more harm than good. Removing the dummies, lift the combs from the queenless hive and set them, bees and all, in their original order, in the empty half of the other. The dummies are used to prevent the bees making a bulging cluster on the outside comb, which interferes with proper spacing when the hive is filled. Close the hive and blow a little smoke in the entrance.

As half the bees in this new hive are on a strange

stand, precautions are taken to insure their safe return when they first fly out in the morning. An alighting-board is set on edge in front of the entrance. The bees, being compelled to go around the ends to get out, discover that their home is changed, and circle about to locate themselves before flying away. In spite of this, however, many go back to their old home and fly about for some time unless old landmarks are removed as much as possible. If other hives are near they may try to enter them, and probably meet their death at the entrance; but in this case, if an empty hive be set on the old stand they soon return to their new home.

Uniting weak colonies is done in October when the hives are being overhauled to insure proper combs, and fed for winter and spring. By another method, when the bees of both swarms have been well smeared with the syrup, the queenless ones are shaken on the alighting-board of the other and allowed to run in. In this case it may not be necessary to kill the poorer queen beforehand, as she can be easily distinguished and caught on the alighting-board as the bees spread themselves over it while going in. The best combs are selected from each to make up the new hive. The disadvantage of this method is that the strange bees mix at once with those in the hive, and are more apt to be stung; whereas, by the former method the mingling is very gradual, and involves less danger.—Farmers' Advocate.

Elgin Co., Ont.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 662.]

Mr. Selser—I don't believe there is one in Philadelphia that adulterates honey, because he must put on the combination. You can find honey put up in glass packages and mark "pure honey."

Mr. Abbott—Let me make a suggestion: They do not sell this honey in Philadelphia, but they ship it to Missouri or some other State. Every little while we see Philadelphia honey. It comes from every place.

Dr. Mason—If one lives in a congressman's district, even if you did not support your representative, you have influence over him, and he is generally glad to please you, and thus perhaps get another supporter if he can. At any rate, don't fail to try your power over him.

Some one suggested that a committee of three be appointed to see that Mr. Abbott's paper is published in a Philadelphia newspaper, but Mr. Miller, of the Philadelphia Call, being present, was introduced, and said: "Altho not a member of this Association, I have been interested in its proceedings, and have tried to have a reporter here, and we will be glad to publish Mr. Abbott's paper. As a matter of courtesy we would not ask to get ahead of other papers in the city, but will put the address in type and furnish proofs."

Mr. York—It is possible that Mr. Miller may be able to get some of the President's address published also.

Dr. Mason—It may not be best to have all that is said published. It might do more harm than good.

Mr. Selser—City papers are not like country papers. If they thru courtesy put any more in, all right.

Dr. Miller—There is one thing that I think ought to be said. While what Mr. Miller has said is true, I will say that the press of Philadelphia has shown more courtesy than has that of any other city in which we ever met.

Mrs. Starr (of the Public Ledger)—I wish to say that I was scolded for not giving more extended notice. I had but one program, and so could not scatter them as I might otherwise have done, and the G. A. R. naturally takes more of our notice.

Dr. Miller—When a woman lacks material she makes it.

Hon. Eugene Secor, of Forest City, Iowa, General Manager, then made the following verbal report:

Report of the General Manager.

I have no written report. I did not notice that I was on the program until a day or two before I left home. I might say for the benefit of some, that during the meeting in Omaha the General Manager was empowered to initiate measures in some city for the prosecution of the adulterators of honey. After consultation the Board of Directors concluded to make an effort in Chicago, Ill., to secure the conviction of adulterators.

In the first place, we needed a chemist who knew how to test honey so as to *know* when it was adulterated, so we secured the services of a competent one, and gave him samples and let him analyze them. We spent the sum of ten dollars in analyzing honey. I made a contract with a lawyer, and he was to take the sole charge of matters. He had nothing to do in court except to get witnesses and look after matters in general.

I thought it was not necessary to make a written report, as I soon shall make one, but the Association has spent \$200 to enforce the law on adulteration in Chicago. Mr. York has given quite a full report in the American Bee Journal, which has been copied in Gleanings in Bee-Culture. In the American Bee Journal for Aug. 31, there is a very full report of this case, and I wish to say that Mr. York cannot be too *highly* praised for his efforts.

I would like to know how many present read the Bee Journal; let all such raise a hand. [A large majority raised a hand.] I see so many read it that I will omit reading the report.

Mr. York has shown great interest in this matter without any compensation. I don't know how you *can* compensate him in any other way than by subscribing for the American Bee Journal.

Mr. York didn't know that I was going to say this, and I have not been asked to say it. You can read this report and see what has been done in Chicago. The money has not been wasted. Producers label their products correctly, but adulterators falsify their labels.

I might add that on this matter of adulteration I have many things to say, but they will go in my annual report. EUGENE SECOR.

Mr. Selser—We do not have to do anything of this kind in this State. There are appointed eight commissioners, I think, and if you go into any store and try to sell adulterated articles you will get caught up very quickly.

Dr. Mason—In Ohio we have a pure-food commissioner with a large number of deputies scattered all over the State, who are watching for adulterated articles. The commissioner does all the prosecuting, and the State pays all expenses, so we have no adulterated honey in Ohio.

E. R. Root—I suggest that in prosecuting adulterators the Board act *independently*. If any of the members have any suggestions to make, all right. I move that the work of prosecution be carried to the fullest extent that the treasury will admit of.

Dr. Mason—Why not leave the matter to the Directors, and treat them as we should our congressmen, as our representatives, giving them all the help we can, making such suggestions as we deem best, but leave all matters to their best judgment, and entirely in their hands.

At this point Mr. York, who had been appointed a member of the committee on resolutions, requested to be excused from serving, and Pres. Whitcomb appointed W. Z. Hutchinson in his place.

Mr. A. L. Root was on the program for an address, but, being unavoidably absent, Mr. E. R. Root had been requested to occupy his place, and did so in the address which follows:

Apicultural Statistics for the United States.

I did not come prepared to present to this convention an array of statistics. If I had, I would have brought a longer list; but in view of the fact that I have been asked to take the subject assigned to my father, who could not be present, I thought I could do no better than to present to this convention a few figures that have recently come to my knowledge.

By way of preface, I desire to say that government statistics have been very unreliable. For instance, South Carolina has been credited with producing the largest amount of honey of any State in the Union. New York and California, on the other hand, have been placed clear at the bottom of the list as honey-producing States. Any bee-keeper who knows anything about the industry knows that such a statement is as wide of the truth as it possibly can be. California and New York are probably in the lead, while South

Carolina is probably at the bottom of the list. For years no one has known just how large our industry is when measured in dollars and cents, altho a great many guesses have been made. It has been estimated that there are something like 300,000 bee-keepers. This estimate was based on the fact that we at one time had a catalog or list of the names of something like 300,000. Indeed, we have such a list now. That there are 300,000 people who keep bees is probably a conservative figure; but that there are 300,000 of what might be called bee-keepers—persons who make the production of honey at least a prominent side-issue is doubtful. I should say a fair estimate of the first class I have mentioned would be something like 500,000; and of the latter 200,000—that is, 200,000 *actual* bee-keepers; for in this list we do not include those who keep one or two colonies in old-fashioned skeps or log-gums.

If there are 200,000 bee-keepers, what is the total output of honey, both comb and extracted, that is annually produced in the United States? Up till within recent times no reliable data have been presented upon which we could base an estimate. A few years ago I tried to get the manufacturers of bee-keepers' supplies to make a report of the number of sections annually sold within the current year. While some complied with the request, others, thinking possibly that some advertising scheme was on foot from which odious comparisons would be drawn, declined to give the number of sections they sold. I thought that if we could get at the actual figure, we could get a very close estimate of the number of pounds of honey annually produced, providing, however, that this figure would be an average for a series of four or five years. Within the last two or three years, however, we have been enabled to get hold of the figures, so that I believe I am to-day able to report the number of section honey-boxes actually made in one year. Now, then, for the figures:

The average number of sections made each year for the last three years is somewhere between 50,000,000 and 60,000,000. We will suppose that the sections, on an average, when filled with honey and placed on the market, will hold something like $\frac{7}{8}$ of a pound. After talking with various members of this convention between sessions, I am inclined to place that as a fair estimate. To make even figures, then, we will estimate that there are 50,000,000 pounds of comb honey produced annually in the United States. Calling this worth 10 cents a pound, which I believe is conservative, this would make the entire comb-honey product worth \$5,000,000.

But, you will say, some years a good many unused sections are left over. Granted. But there will be, on an average, as many left over from one year as another. While perhaps three years is not long enough time to reduce the figures to a good average, yet I should say the last three years, considering that two of them were very poor, would give us a very conservative figure; so, if anything, the amount of comb honey annually produced in the United States is not only worth \$5,000,000, but somewhat more. Just how much more I should not dare to say.

Now, then, if \$5,000,000 represents the comb honey annually produced, how shall we get at the amount for extracted? This is somewhat more difficult. However, I think we can safely estimate that, in view of the fact that extracted honey is produced much more largely in the South than in the North, and that a good many bee-keepers in the northern portions of the country produce the liquid article, it will be fair to assume that there would be just about twice as much of extracted honey produced as of comb. This would give an aggregate of something like 100,000,000 pounds of extracted every year. Calling this worth 5 cents a pound, we should have another \$5,000,000—a valuation that I should consider rather conservative than otherwise; for good extracted honey sells at 6 and 7 cents ordinarily, and off grades at 3 and 5, while California honey, when it reaches the markets of Chicago and New York, costs anywhere from 5 to 6 cents.

I have not ascertained the exact number of bee-hives made by each manufacturer; but I know the product turned out by one or two of the largest; and taking this as a basis I estimate that something like 200,000 hives are made every year. Ten years from now there will be at least 2,000,000 hives in the country. Assuming that a like number has already been made in all the years gone by, we may estimate that something like 4,000,000 hives will be scattered thruout the country. I say "estimate," for I fear it is nothing more nor less than a poor guess. Assuming that there are now 2,000,000 hives and 200,000 bee-keepers, that would leave 10 hives to each bee-keeper; and by a bee-keeper, as I have explained, I mean any person who has

modern hives, and who attempts to put up his honey in the ordinary modern package.

Some years ago Mr. Newman, then editor of the American Bee Journal, figured that there were 300,000 bee-keepers in the country, and that there were 10 hives to the bee-keeper, on an average. This would make an estimate of something like 3,000,000 hives. Altho several years have elapsed since then, it is at least true that my estimate of 200,000 bee-keepers and 2,000,000 colonies is quite conservative.

The only figures that I am able to present to you as being anywhere near accurate is the amount of comb honey annually produced. All the other figures are based somewhat on this, and are more or less estimated. But I think we may safely say, by way of recapitulation, that our industry represents an annual product of something like \$10,000,000 in honey alone.

'TWOULD STRAIN OUR INVENTION.

Home from the convention—
We hardly need mention
How blessed it was to be there;
But it's not our intention
Too much for invention
To tell you WHAT PROFITS we share.

A TRIPLET OF "AFTERTHINKS."

Capital editorial idea to clap into the convention number the pictures of the United States' officers and directors. That Florida bear-trap (or night-cap) I think an excellent idea which ought not to be forgotten. Page 570.

C. P. Dadant is a man after my own heart in despising to have the entrances trapt up with perforated zinc. But we Minnie folks have to have it under the extracting-supers.

DISTANCE TO PREVENT MISMATING.

Doolittle's highly important evidence on page 564 is not new; but it is needful for it to be often repeated, so many high authorities are determined to resist it. Bees do cross at five miles distance, and it is all in the queen-breeder's mind (in most cases) that his queens *cannot* mismate.

SWARMS DESERTING—VISITING DIFFERENT FLOWERS.

Mr. Doolittle solves with much ability the first of the problems on page 578. I have thought in such cases of swarm failure that it was disgust, and a sense of their helplessness to save their queen, rather than a lack of queen scent, that made the bees go home, all but the few engaged in hostilities.

And so the adherence of bees to one kind of flower during a trip is not so absolute as we have sometimes thought, seeing he observed raspberry and clover visited successively. I think a bee prospecting for honey, and *not getting much anywhere*, visits freely any flowers that may come handy. Perchance neither clover nor raspberry were yielding very well when he made this observation.

QUEEN-REARING COMMENTS.

Mr. Alley is one of the specially eminent queen-rearers of this continent—one of the first half-dozen—and therefore his pictures and article, page 577, deserve the most careful consideration. He hardly needs to prove to us that we do not *have to* make artificial cups, and put in jelly by hand, and all that sort of thing; it's only a matter of convenience and speed—always providing that the artificial methods do not deteriorate quality. To say 84 hours after laying is more to the point than 12 hours after hatching, because the time of laying is easier found. His arrangement of cell-holding sticks to slip in and out of suitable notches is admirable. Wonder why he curves the lower surface in such a long, regular curve. And why is the beeswax in such things on with half resin? Perhaps pure beeswax is more inclined to let go. And the man who objects to fine, fussy work, for him to do there'll always be coal to shovel and

ditches to dig—he's out of place at queen-rearing. The remarkable thing about the system is that after 48 hours the young queens are nursed by bees not queenless. I suppose the proximity of lots of young brood is what is desired, while the broodlessness of the starting colony is depressing, and damaging to the results if the queens stay there too long. "What is home without a baby?"

KILLING BEES TO SAVE THE FOOD.

On page 579, Mr. Armstrong is right that the bee-business abounds in *surprises*. Killing part of a colony in the fall to save the food they would otherwise eat, it will do to mention as an eccentricity, but not as a plan to be tolerated. Not only is the danger of losing the colony greatly increased, but even if they survive the gain is little or nothing. The amount of honey 5,000 bees by themselves would eat in getting thru is nearly the same as 10,000 would require. If the conditions were very favorable I am not sure but the 10,000 would sometimes eat less than the 5,000.

"FROM THE EGG TO THE PERFECT BEE."

The article of H. W. Brice, page 579—"From the Egg to the Perfect Bee"—it would take a whole Afterthought to talk of all its talkable points. We are sometimes told minute particulars which do not verify when a body tries to verify them. Hardly want to hint that this is an example, but still it will do to "watch a little out." Have we not somewhere photographs of the position of bee-eggs which hardly tally with what Mr. Brice tells us? Even granting that *most* of the items are correct, the paper is a valuable one that should not be neglected. I feel surprised by the statement that the young larva is certainly unfed for 12 hours. I had supposed that bees when feeling in a hurry for brood, placed food around the eggs a little before they hatched. But then I never made minute personal observations. Not making them when I was young and keensighted, they would be troublesome now—'spects I must leave it to the boys. Was also unaware of any distinct "weaning period," when the change is made from jelly-like food to the coarser kind. May it not be that the food for the little fellows and the food for the half-grown ones is prepared by two different sets of nurses (we would incline to say it *must* be so), and that occasional failure to connect, rather than any deliberate weaning, is the real state of the case? As to the 12-hour initial fast, that seems a little more reasonable when we remember that chickens need no food for a long time after hatching. Accepting this author, there are three distinct kinds of larval food: 1st, a transparent fluid; 2nd, a milky semi fluid; and 3rd, a food containing comminuted pollen-shells or residual matter.

EXTRACTING FROM THE UPPER STORY ONLY.

Yes, Mr. Snell (page 580), two stories of extracting-combs, extracting from the upper, but never from the under—putting the under up above instead—that's the way to have a prime article. But what are we poor wretches to do who never have a flow strong enough to justify so big an outfit? The Pettit system, given on page 594, answers this last question quite well.

THICK WALLS FOR THE STRONG—THIN FOR THE WEAK.

Thick-walled hives to winter strong colonies, and thin-walled hives for weak colonies. May be, Mr. McNeal, you are right for the Ohio River; but I doubt the latter part of it for the Ohio north line. Page 580.

SINGLE TIER OF HIVES IN A HOUSE-APIARY.

Quite likely A. H. Duff is right in moving for the total abolition of the upper range of hives in house-apiaries. Manifestly an annoyance when manipulating the lower range. The only object seems to be to save half the construction expense. Make the saving by a cheap style of construction. Doubling the expense to have the house "scrumpions," and then halving it again by crowding a grand nuisance inside, is hardly sensible, that's a fact. He says a convenient painted house can be made for one dollar a hive with only one range. Page 581.

NOT A MAKE-BELIEVE PHILOSOPHER.

That little boy, page 585, who *made believe* a bee was stinging him, to keep himself from over-estimating the pain he was required to bear during an operation, was a philosopher of the first water.

LATE FERTILIZATION OF QUEEN.

The evidence offered by Bernard W. Hayck, page 589, that a queen was fertilized at seven weeks old, seems to be

very nearly absolute. Valuable bit of experience. Quite possibly in many cases of aged virgins inborn worthlessness and not age is the real trouble. I believe it has been *suspected* sometimes that queens emerging late in autumn became fertile in the spring; but I do not remember any positive case which came near to this one.

PUT HIM "IN PICKLE."

He'd know the location of pickled brood,
That "Colo" man, that "Colo" man.
Who can sate his inquiring mood?
No one can, no one can
Send him down where all pickles are,
To the pickle-jar, to the pickle-jar.

DUTY ON CUBAN HONEY—MODERATE SWARMING.

Ninety percent of the bees of Cuba extinguished by the war! But peace could very quickly restore them—we needn't stop crying "wolf" on that account. But it is coming to look rather doubtful whether the duty on Cuban honey will ever be taken off—even if Cuba stays American. Interesting to hear that (contrary to what one would expect) swarming is quite moderate in Cuba—not nearly the trial that it is here. Page 596.

WINTERING AND HONEY-STORING—BULGED SECTIONS.

It's a little disquieting to learn that the colonies which winter best will not give one so much surplus as those less fortunate. It would be a relief to say, "Don't believe a word of it;" but it's *Doolittle* that says it (page 594), and it's not healthy to "conspire" him. I'll just say it's because he keeps pure Italians and I keep well-bred hybrids. I think my kind seldom crowd their queens with honey. Put honey in the brood-chamber often enough, but willing to take it out again when she wants them to.

Mr. D. shows excellent knowledge of human nature when he multiplies by ten the "*few*" bulged sections that the anti-separator folks admit they have.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Black Drops from the Bee-Smoker.

Not long ago in reply to a question in this department, I said the remedy for a smoker that let fall inky drops was to clean the smoker. F. L. Thompson mentioned this in the Progressive Bee-Keeper, and said he had just tried his smoker after a fresh cleaning, and it was more vicious than ever before in dropping the black stuff; but he gave no remedy.

There may be a difference in cleaning smokers. If you clean out the nozzle of the smoker, it will drop worse than ever. Clean tin is a good non-conductor, so the moisture in the hot air condenses on the tin surface and runs down in black drops. When the inside of the nozzle is coated well, that serves as a non-conductor, and the dropping is not so bad. The cleaning out, however, to which I referred, was that lower part under the fire that in most smokers admits the air to the fire. The little holes there sometimes become clogged, and when you clear them out so as to make the fire have a better draft, I think you will find less trouble with the dropping. It may not make as much difference as I think, but certainly I do not think cleaning out the nozzle will help.

Critic Taylor comes to the rescue in the Bee-Keepers' Review, and says the remedy is dry fuel. Of course, the less moisture there is, the less can condense and drop. Why didn't I say so before? Just because I didn't know any better. My ignorance is less excusable because during the past summer I have used very dry chips from the chip yard and have had no dropping. But it never occurred to me

that it was because the fuel was so dry; and it never occurred to me that a clean nozzle might be worse than a foul one. I am much indebted to the brethren for straightening me out.
C. C. MILLER.

Ownership of Wild Bees—Best Hive.

1. If I find wild bees in a tree on somebody else's land, can the owner of the land claim the bees?
2. What is the best kind of bee-hives? MINN.

ANSWERS.—1. That depends upon your laws, which you can find out about from some lawyer or justice of the peace. Very likely you will find that the one that finds the bees may have some claim on them, but if he cuts down the tree he is liable for damage.

2. That depends upon circumstances. If you follow the old plan of taking up bees in the fall without ever taking any surplus from the tops of the hives, then there is probably nothing better than the straw skep made in the shape of a sugar loaf. If you have surplus boxes on top, but never want to open the brood-chamber, then a common box-hive is the thing. Next to the straw-hive it suits the comfort of the bees. But if you want to investigate the brood-chamber at proper times, (and if you are intending to do very much at bee-keeping you will want to do so), then the movable-frame hive is best. Of these there are many kinds, and there is a difference of opinion as to which is best. What may be best for one may not always be best for another. Probably the most popular hive just now is the dovetailed, with frames 17 $\frac{3}{8}$ x9 $\frac{1}{8}$ inches, outside measure. Those who give close attention to their bees may do with the 8-frame hive; for others, a larger hive is better.

Combs Bent and Broken in Extracting.

I bought an extractor from Ontario, and put into it some beautiful, straight combs in the Hoffman frame, and almost all those combs were bent and some broken when taken out of the honey-extractor. The honey taken from them was all right, but the combs were in a bad shape. Is this a common fault with extractors, or is it due to the weakness of the combs, or what? NEW BRUNSWICK.

ANSWER.—One cannot say positively without seeing, but the probability is that the combs were new and tender, and heavily filled. In such case they may break in any extractor unless great care is used. First turn the extractor slowly, and empty one side partly. Then empty the second side, after which complete the first side.

Bees Carrying Water in the Fall.

Do bees store water in the cells in the fall of the year for winter use? I see my bees are carrying water from the hens' drinking-dishes. MASSACHUSETTS.

ANSWER.—Bees carry much water into the hive, especially in the early part of the season when they are breeding heavily, but I have never seen any testimony to the effect that they store it in the cells. It is probably used to dilute the honey for consumption.

Inside Hive Arrangement for Winter.

I have a precious colony of bees that I got from Toronto last June, and tho I lost about half of them in bringing them up here, they built up fast, and have kept strong ever since. They have filled their hive with nice honey for winter stores, but the end of September brought cold, wet weather, and they have taken to fighting the drones that are big, strong ones, often throwing them off with an angry buzz, and then they bounce back into the hive again. I often feel like helping the workers, but fear I might kill the queen, and I do not like to kill even a drone. It does seem strange that one cannot go far into the study of Nature till he finds the strong oppressing the weak. However, I do not think the workers use their stings in fighting their stingless brothers, but meet them honorably on their own ground, which is another thing to be wondered at.

But what I wanted to write about was the construction of the hive inside for winter. As this is my third attempt with bees up here, I would like very much to succeed. Our

winters are long—six or seven months—and the temperature drops as low as 40 degrees below zero during some cold snaps. I want to put a two-inch dummy filled with chaff in each side of the second story, and a one-inch dummy in each side of the first story. That will leave four frames in the top story and six frames in the bottom. Should there not be fewer frames, and more room for clustering in winter?

And if the 10 frames are filled with honey, the four dummies with chaff, a quilt on top, and close fitting cover, with no ventilation on top, do you think that would do for the inside?

I will pack in a case all around the outside with nice, dry leaves, and there is always lots of snow. Last year the frost never got into the ground at all, the snow was so deep. I very much fear brood-rearing will have stopt, but we expect good weather yet. THOMAS HENRY.

Muskoka, Ont., Sept. 29.

ANSWER.—It is now in general considered best to leave in a given space the same number of frames in winter as in summer. Those frames filled with honey are better than empty space, and your arrangement is probably all right, only with no top ventilation you must be sure to have plenty below, leaving the full summer entrance.

Moving Bees After Dark—Whiskey for Bees.

1. Is it possible to bring a few bees from a neighbor's apiary after dark, so that they fly the next morning to induce robbing from your own colonies?

2. Is whiskey good for bees, if you know how to mix it with honey? INQUIRER.

ANSWERS.—1. If you should bring a few bees from your neighbor's apiary after dark, letting them fly at will in the morning, you would hardly induce robbing thereby. A few strange bees allowed to enter a hive after dark would stand a good chance of being killed. If not killed, they might unite peaceably with the colony, but they would not be more likely to rob than if they flew to your hives in the daytime.

2. Whiskey is not good for bees, neither mixt with honey nor straight. ["Touch not, taste not, handle not," is the best way to treat whiskey.—EDITOR.]

Packing Material for Winter—Late-Reared Queens.

1. Where chaff is not obtainable for chaff division-boards and chaff cushions, what is the best substitute? How would dry leaves answer the purpose, wheat bran, dry sawdust, and oats? If all of these substitutes are practicable, which is most suitable?

2. How would this style of packing work for cellar-wintering? Draw down smoothly over the tops of the frames, and down the outside frame on each side of the brood-nest, say half way down, three or four thicknesses of newspaper, first cutting thru each comb four or five $\frac{3}{8}$ -inch holes about four inches below the tops of the frames, leaving off or using Hill's device, as may be best.

3. If queens hatcht in autumn should not become fertilized before spring, would it be best to destroy these young queens in the spring and replace with laying queens, or await their fertilization? METROPOLIS.

ANSWERS.—1. Any of the things you mention might be used for packing except probably oats. Dry leaves are excellent. Perhaps, all things considered, dry planer-shavings are as good as any, especially as they are in most cases so easily obtainable.

2. I think bees would do well with such packing, and if your cellar is all right they will do without any packing and without any holes in the combs. In a few days my bees will go into the cellar just as they were on the summer stands, only there is an entrance two inches deep the width of the hive, and a space of two inches under the frames. The papers might be troublesome to the bees, for they would be likely to gnaw them.

3. Some say that a virgin queen may stay in the hive thru the winter and be fertilized in the spring. Mr. Simms, the editor of Bee-Chat, says in the most positive manner that such a thing never takes place; that in the supposed cases the young queens were fertilized in the fall but did not begin laying till spring. If you have a young queen that does not lay in the fall, it might be worth while to wait in spring till you see the raised cappings of drone-brood in worker-cells before you decide to kill her.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. OCTOBER 26, 1899. NO. 43.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Advancing Price of Honey.—Rev. E. T. Abbott wrote us Oct. 13, and in reference to the advancing price of honey had this to say:

I noticed what you said in your editorial on page 632, about the advance in the price of honey. I had been wondering why some one did not make the suggestion that honey had already advanced, as it has been bringing from two to three cents more per pound this year than it has for some time. They are wanting 13½ cents by the carload, for Western comb honey delivered here, and I think I could have bought the same kind of honey last year for 10 cents. Everything has advanced in price, and honey is no exception to the rule. I feel quite sure that it will continue to advance until the next honey crop is harvested, and I doubt very much if it is ever again as low as it has been.

Yes, honey is honey, and worth money, this year. We are glad the price has gone up to something near where it ought to be, and we hope it will remain there. Of course, when nearly everything else rises in price honey would naturally go up some, too, even if there was a large crop. But now that it brings a good price, every effort ought to be made by producers to keep it there. It will help, next year, to be careful not to rush the whole crop into one city, and all at the same time. A more even distribution will help wonderfully to sustain prices. Right here is a place where the honey-producers themselves can help their own interests if they really care to do so.

Removing Honey Without Bee-Escapes. In the Bee-Keepers' Review Critic Taylor quotes F. A. Snell as saying, "Before the invention of the bee-escape there was no way

to take off honey without demoralizing the bees, unless one waited until cool weather." Mr. Taylor thinks this would be deplorable if true, but he has not found it to be true. He says, "If all unnecessary handling of bees during times of a dearth of nectar is avoided, all necessary handling with judicious management may be done without educating the bees up to the point of making annoying attempts at robbing." He says *rapidity* is the key, two working better than one—one with smoker and brush, the other to do the handling, stopping for a time when the bees show undue excitement. He goes to the other extreme from Mr. Snell, and says, "As a rule a bee-escape is a nuisance."

Probably there are differences in persons as well as localities. Mr. Snell might be told that tons upon tons of honey were taken before the day of escapes, and without demoralizing the bees, and that many times in hot weather a super of honey may stand exposed for hours without starting robbing. On the other hand, while Mr. Taylor and other veterans find no use for an escape, to others, probably to the great majority, it has been a boon.

Honey for the Complexion.—F. L. Thompson, in the Bee-Keepers' Review, translating from a foreign bee-paper, gives this:

"Herr Maurus says that Roumanian girls often mix honey with water for washing face and hands, and affirm that it produces a very fine complexion."

Undoubtedly it would work in the same way on the complexion of our American girls, should any of them require it. Surely, it is an inexpensive remedy.

Getting Bees Ready for Winter.—In the October Progressive Bee-Keeper, G. M. Doolittle gives the following directions for preparing bees for winter, especially as regards the matter of food:

By the time this number reaches the different readers, all colonies of bees should be ready for winter, unless in the most extreme Southern States. Are they thus ready? is the question each should answer. Fearing that some may not be (from the many letters I receive telling of the poor season, and that they will be obliged to feed), I am led to urge any who have not attended to this matter of winter preparation to do so at once. And I am asked to tell what to feed where stores are lacking, and the person has not enough to go around. In such a case I know of nothing better for winter feeding than the following:

Take any tin, iron or copper vessel of suitable size, and put therein 15 pounds of water, placing the vessel over the fire until the water boils, when 30 pounds of granulated sugar is poured in, stirring briskly while slowly pouring, so that it may not fall in a mass to the bottom of the vessel and burn it before it is dissolved. Having stirred until all danger of burning is over, allow it to remain over the fire until the whole begins to boil again, when the vessel and contents are set from the fire and five pounds of extracted honey stirred in. As soon as it is so cool that you can bear your finger in it, it is ready for the bees, and can be fed in any of the many good feeders in use, or you can provide a feeder by using any pan, basin or can you may happen to have, always using some grass, shavings, corn-cobs, etc., for a float to keep the bees from drowning.

The honey is put in the feed to keep it from turning back to sugar again, and is the only sure thing to keep thick sugar syrup in the liquid form that I know of.

A Cure for Prejudice Against Bees.—Quite frequently instances arise where certain neighbors of bee-keepers become jealous, or have some differences of opinion which cause them to take steps to get the bees out of the neighborhood. In the Agricultural Epitomist of recent date we find the following suggested cure for such prejudice or jealousy:

Writing from Iowa a subscriber objects to a near neighbor's bees, on the ground that they injure his grapes every year. He thinks that there should be a law to prevent people from keeping bees. This is an old question, and one

that will probably never be settled, tho it has been pretty well settled in the minds of the majority of people who have given the subject serious attention. The majority do not believe that bees injure fruit, and the majority believe that bees are of the greatest utility in pollenizing fruit. We think that the cure for the belief of our correspondent will be found in keeping bees himself.

We have noticed that when people who did not like children, came to have children of their own, they lost their prejudice against the little people who once worried them so much. We recommend the cure to the bee-hater. It will save him lots of worry, and add to his life. The only place in which we thought bees were intruders and trespassers has been in the city, and even there they did not do much harm.

We believe the above is a pretty good suggestion, and well worth trying. Suppose you have a neighbor who objects to bees near him for some unreasonable reason. Just try in some way to get him interested in bee-keeping and to own a colony or two. After he has had them a season or so, and eaten some honey produced on his own place, and by his own bees, the chances are that he will no longer object to bees, even should he later discontinue keeping them himself.

Honey Shows in England are made more of than in this country. Nearly every number of the British Bee Journal has some mention of them. A somewhat recent number of that journal has for its editorial leader, "The Final Honey Shows for 1899." The British and Colonial Industrial Exhibition at Manchester lasts four weeks, where \$75 in prizes is offered bee-keepers with advertisement cards allowed on the exhibits after judging. A little earlier, at the same place, was held a show in connection with the Grocery Trades' Exhibition, in which it seems there was open competition for master grocers only, and nothing but British honey allowed.

Then there is the Grocery Trades Exhibition in London in October, and perhaps most important of all the Dairy Show, Oct. 17 to 20. The British Bee Journal earnestly urged an exhibit at this show from every county in the kingdom, which it thinks would greatly assist in singling out the best honey-districts in the kingdom. The probability is that on this side the water some of the bee-keepers who are quietly working away in the best honey-districts, would not care to have those "best honey-districts" too widely advertised.

The Weekly Budget

MR. WM. COUSE, Secretary of the Ontario Bee-Keepers' Association, we regret to hear, is suffering from an attack of typhoid fever. We trust he may soon fully recover.

REV. E. T. ABBOTT, of Missouri, writing us Oct. 13, reported the death of his father, Oct. 11, in St. Joseph, Mo., at the age of 82 years. He had been ill for quite a while, so the end came not unexpected.

HON. J. M. HAMBAUGH, of San Diego Co., Calif., reported in the American Bee-Keeper that that State produced 3,750 pounds of honey in 1870, and 3,500,000 pounds in 1876. A pretty big gain in only six years.

MR. E. M. STORER, a veteran bee-keeper of southern Georgia, has disposed of his interests there and sailed for the island of Jamaica, taking a position with the Jamaica Bee-Supply Co. So reports the American Bee-Keeper.

MR. FRANK H. DREXEL, of Montrose Co., Colo., sends us the following clipping, with the remark, "You might perhaps need it in your business!"

"Good morning. Have you paid your subscription this year? Perhaps you owe for last year, or several years, or may be for job work or advertising. Now, you understand, we don't need money, for we have millions--to get; but it is really an imposition on our part to let people go on carrying our money around when we are so strong and healthy and abundantly able to bear that burden ourselves. For this reason we ask everybody who has any of our money in his possession to leave it at the office, or send it by mail, express, freight, or any other old way, just so it gets here. Silver and gold are heavy, and it would be a matter of life-long regret if any one should get bow-legged carrying it around for us."

Well, we don't exactly need the above paragraph, but, really, we know right where we could put a thousand dollars or so, if some good spirit would move those in arrears to send it in. We are quite willing to endure the burden (?) of taking care of the money.

EDITOR LEAHY, of the Progressive Bee-Keeper, has this paragraph in the October issue of his paper:

"Following the lead of Bro. York, we have obtained permission from the board of directors of our public schools to address the scholars on the subject of bee-keeping. We will procure a hall that will seat all the children and the teachers, and each teacher, some afternoon in November, will bring his or her pupils to this hall where the address will be delivered."

That's all right with the exception that November may be a little late to have the bees on exhibition. It helps much to have the bees before the children when talking about them and their work in the hive.

WHY NOT DEAL DIRECT with the manufacturer when you can, pay cash for what you buy, and obtain the goods at wholesale prices--be your own agent? The Edw. W. Walker Carriage Co., of Goshen, Ind., manufacture a full line of vehicles, and sell them direct to the consumer at wholesale prices. Letters received by them from users of their goods contain the strongest expressions of satisfaction and endorsement. Their catalog is free, and will be promptly mailed by addressing Edw. W. Walker Carriage Co., 50 Eighth St., Goshen, Ind. Always mention the American Bee Journal when writing them, if you please.

SHARP AS A BEE-STING.--In the Youth's Companion a story is told of a lord and a clergyman who were once driving together, and past the city jail. The lord turned to his companion and jokingly said:

"Where would you be, sir, if that jail had its due?"

Without a second's hesitation his companion smilingly responded:

"Riding alone, I fear."

WHILE ON A BRIEF VISIT to Chicago--that busy, up-to-date and even ahead-of-time Western Bee-Hive--recently, it was the privilege of our secretary-treasurer, Mr. H. Yeigh, to shake hands and exchange greetings with Mr. George W. York, editor and publisher of the American Bee Journal. Mr. York deserves the success he has gained by hard and intelligent work.--Canadian Bee Journal. Thank you.

DR. C. C. MILLER past thru Chicago Oct. 17, on his way to the annual meeting of the Illinois Presbyterian Synod at Joliet, and called on us for two hours. He reports a comb-honey crop of about 6,000 pounds this year, from 140 colonies, spring count, and an increase of about 150 colonies, thus making his three apiaries total about 300 colonies. The Doctor is looking well.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

- We deal almost exclusively in honey, giving it our closest attention all the year round.
- We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.
- We are acquainted with the most desirable trade thruout the country, and know exactly what their wants are.
- We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect? We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

HILDRETH & SEGELKEN,

120 and 122 West Broadway, NEW YORK CITY.

Please mention Bee Journal when writing.

Cork Bee-Hives have been used to some extent in Europe, and at one time were spoken of very favorably. According to late reports in Leipziger Bztg, the cork bee-hive is a failure. When cemented together as in the walls of the hive, cork is not a good non-conductor of heat, making the hive hot in summer. Dampness makes great ravages, the walls finally tumbling down.

Keeping Drones in the Fall is a topic in which Mr. Doolittle gives the advice in the Progressive Bee-Keeper to mass the combs having drone-brood with adhering bees in a pile without a queen. Dr. Mason, in the Bee-Keepers' Review, thinks the advice excellent for some localities, but in his own locality there is no need to be at so much trouble, where bees gather enough to keep up brood-rearing till the middle of October.

Diseased Brood is making trouble in New York State, according to an article in Gleanings in Bee-Culture, by Capt. J. E. Hetherington, but it seems uncertain whether it is foul brood, pickled brood, or something else. He says: "On the surface of things, from facts presented, one might almost conclude three or more diseases existed in the same locality." He is satisfied that the present disease has not the distinct characteristics that existed in the foul brood that raged in the days of his early bee-keeping in the time of Father Quinby. The editor says that as nearly as he can find out this new diseased brood, while similar to foul brood, lacks the peculiar ropiness and the glue-pot odor, the odor, when noticeable, being of a sour,

Two Wagons at One Price.

It is a matter of great convenience and a saving of labor for a farmer to have a low, handy wagon. They save more than half the labor of loading in hauling manure, hay, grain, corn-

fodder, wood, stones, etc. The man who already has a wagon may have one of these low handy wagons at the small additional cost for a set of wheels. These Electric Steel Wheels, with either direct or stagger spokes, with broad-faced tire, are made to fit any axle. You can convert your old wagon to a low, handy wagon in a few moments time. You thus virtually have two wagons at one price.

Write to the Electric wheel Co., Box 16, Quincy, Ill., for their catalog, which fully explains about these and their Electric Handy Wagons, Electric Feed Cookers, etc.

DANDY GREEN BONE CUTTERS

cut all kinds of green bone, hard or soft with withering meat or gristle, into fine poultry food without choking. Various sizes. Run easy and cut fast. Green cut bone will double the eggs winter or summer. Best winter food known. Makes long and strong fivers; makes broiler and chickens grow. Send for Free Catalogue, prices, &c. **Saves 50%.** Stratton & Osborne, Box 21, Erie, Penn.

Root's Column

—THE—

*** ABC ***

—OF—

Bee = Culture.

1,600 COPIES

—OF THE—

1899 EDITION ALREADY SOLD.
(Oct. 17.)

Why does it Sell so fast?

MANY REASONS FOR IT:

The only Encyclopedia on Bees.
Not the views of one man, but many.

See what C. P. Dadant, of Hamilton, Ill., says:

"We are glad to see what a large space you give to the ideas express by us."

Notice the following from a competing publisher:

"It is the most excellent encyclopedia on the subject of bees and the manufacture of bee-keepers' supplies we know of, and we heartily recommend it to any one keeping bees."

R. B. LEAHY.

This book may be had from any bee-journal office, or from any large dealer in bee-keepers' supplies, or sent by the publishers for \$1.20 postpaid, or \$1.00 when sent by freight or express.

THE A. I. ROOT CO., MEDINA, OHIO.

yeasty, fermented character. He then adds:

"This peculiar disease (pickled brood we will call it) will go thru an apiary and then disappear of itself, even when no treatment is administered. It seems to be somewhat contagious; but, like influenza and other maladies of a like character, it leaves the patient (the bees) somewhat the worse for wear."

Planting Trees for Honey. according to "Rambler," in the Bee-Keepers' Review, is not an altogether hopeless enterprise. Many a hillside has been made barren by the woodman's ax, the springs and trout-brooks drying up for lack of the trees to shade them, and where the land is not too valuable for other purposes the replanting of trees may again restore the springs and brooks, with advantage to the soil below. The Government has come to the rescue in California, large tracts of mountain lands being set apart as Government Parks.

Clipping Queens vs. Queen-Traps.—Dr. Mason says in the Bee-Keepers' Review that the only thing that makes a queen-trap of value is that the presence of the queen in the trap shows that a swarm has issued. But even with clipped queens, he thinks there are certain conditions that make queen-traps desirable, as when colonies are kept upstairs where the queen would be injured by falling 10 or 15 feet in case of swarming, or where hives are so close together that the returning clipped queen might get into the wrong hive.

Vitality of Foul-Brood Germs.—Critic Taylor, of the Bee-Keepers' Review, thinks Editor Root has neglected to note the experiments of Prof. Harrison, of Ontario Agricultural College, which experiments seem to support Mr. Root's position as to the need of long boiling; but says: "but there is another side, for even scientists must reckon with practical affairs;" and concludes: "There thus appears, so far, a considerable interval between practical results and the scientist's results. It remains for future investigations to explain and harmonize these apparent differences."

Drone-Cell Queen-Cups.—H. L. Jones, a queen-breeder of Australia, says in Gleanings in Bee-Culture that he cannot imagine how the progressive Yankees, with their love for labor-saving methods and short cuts, can prefer the artificially-made Doolittle cells to the ready-made drone-cells which he has been using, which are just as effective as the Doolittle cups. He has reared thousands of queens with the drone-cells and prefers them to dipt cells. Editor Root replies that with drone-cells the queen-cells must be started in a queenless colony (in which he is possibly mistaken), and that it requires little labor to make the Doolittle cups, 1,000 being only a day's work.

H. L. Jones' Plan of Clipping Queens is thus given in Gleanings in Bee-Culture:

"Grasp the queen by the wings, and place her on the top of your left fore-finger, which she will eagerly grasp; then bring your thumb down on her legs, and you will have her as securely as if in a vise. There will be no danger of her legs getting between the scissors, which should be slipped under the longer wing on only one side. The whole operation takes but a few seconds, and the queen can be liberated right on the combs by simply taking the weight off her legs, and she hardly knows that she has been interfered with, as her delicate body has not been touched."

Rambler's Scale.—Rambler describes in Gleanings in Bee Culture his scale for weighing hives and bees that he constructed at an outlay of 10 cents and some muscle. A platform large enough to hold the hive is suspended by ropes at one end of a pole sufficiently strong, stakes being driven in the ground about the place of

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 26 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now, and 1 1/2 miles from Prairie View on the Wisconsin Central railroad. The beautiful Desplaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairy-farming, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc., Mrs. J. B. Agers, Libertyville, Lake Co. Ill. Please mention Bee Journal when writing.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$2.00. Bnt, as a **SPECIAL OFFER**, and only until next Jan. 1, we will mail this book for only 75 cents provided you send enough in your Bee Journal subscription to pay all arrearages and to the end of 1900. Those having already paid their Bee Journal subscription to the end of this year, need send only \$1.75 for the book and the Journal for 1900. This is a splendid chance to get a grand bee-book for a very little money.

ADDRESS,

George W. York & Co.

118 Michigan St., - CHICAGO, ILL.

the hive so the wind will not blow the bees about too much. At the other end of the pole is hung a box which is filled with stones to balance the hive so as to swing as high as possible. Then the 10-cent balance is adjusted to the weight-box, and every pound of weight shown by the balance means so much weight of gain in the hive. If loss is to be shown, then enough stones must be taken out of the box so the hive shall show a weight of six or eight pounds.

Getting Unfinisht Sections Cleaned Out.—A Stray Straw in Gleanings in Bee-Culture is as follows:

"I put 46 snpers of unfinisht sections in the shop cellar, piling them crosswise, and then opened the door about Oct. 1. The weather was fine, and it took the bees about two days to cleau them. Combs gnawed a little, but not seriously."

Editor Root adds this comment: "This or a similar method is the only practical way of emptying out unfinisht sections. They may be piled in stack-up-hives with a small entrance, or in a dark cellar, where it takes the bees a little time to find their way to the honey. If I am not mistaken, nearly all the largest comb-honey producers use either one or the other method; but you will remember that it was opposed pretty vigorously by some of the leading lights at Philadelphia, on the ground that it has a tendency to incite robbers, and that bees once robbers are always robbers. We have tried the plan here a good many times, and I do not see that bees are any the worse off when it is over with than wheu they begin."

GENERAL ITEMS

Report for the Past Season.

Last fall I put into winter quarters 79 colonies, and lost 23 in wintering, two being queenless. I commenced with 54 colonies last spring, and increast them by natrnal swarming to 67, which are in fine condition for wintering. I got 3,300 pounds of extracted honey, 112 pounds of finisht sections, and 300 ponnnds of comb honey not finisht, but salable at 10 cents a section. Honey sells like hot cakes at 8 cents for light, and 7 cents for amber extracted; comb honey, 15 cents. WM. SEITZ.

Dodge Co., Wis., Oct. 14.

A Good Deal of Swarming.

Bees did very poorly the past summer. There was no surplus honey. I had five colonies last spring, and now have 15. One colony did not swarm at all, and three swarms I put into the hives with the others. It seems to me that is a good deal of swarming for four colonies. J. CAMP.

Harlau Co., Nebr., Oct. 14.

Bee-Keeping in Chili.

Permit me to say in reply to the article by Mr. Juan Dupont Lafitte, that while I find a general idea of Chilian bee-culture quite clearly conveyed therein, I feel it a duty to offer some comments on certain statements there given.

Owing to the limited time that Mr. D.-L. has been among us (as it is only some three years since his arrival in Chili) it is not improbable it is difficult for him to obtain reliable information in regard to all branches of bee-culture in this country.

He says Italian bees were introduced into this country in the year 1865, when, in fact, it was in 1854, some 25 years before their introduction into the United States.

No far as my information goes, in the year 1865, Mr. Vincente Chuecas owned an apuary of 640 colonies, 310 being in box-hives, and 150 in frame hives of the German

style, which were a sort of box like the Harbison hive, but not exactly so.

Mr. Chuecas is still alive in Santa Fe, near this town, tho he does not practice bee-keeping now, as he is engaged in other agricultural business. He says he gave up bee-keeping on account of the low price of honey and wax in those times, say \$3.50 or 44 pence, for honey, and \$20 for wax, per quintal of 46 kilos—equal to 100 pounds.

In 1888, another bee-keeper, Mr. Alfredo Dnifey, started bee-keeping with a colony of bees in a Dadant-Quinby hive, and his apiary numbered last season 76 colonies, all in Dadant-Quinby hives.

By this you will notice that Mr. D.-L. has been misinformed, and that frame hives were known in Chili much earlier than he thinks.

Regarding honey-yielding, I do not agree with Mr. D.-L., and from my own experience I can say that my crops for the past 3 years have been an average yield of 134 pounds per colony, and I have had colonies which have given the maximum of 182 pounds.

I use the De Layens hive with 20 frames 16½ inches deep by 13 inches wide, and tho Editor D.-L. considers deep frames inconvenient for the climate of Chili, I have been able to winter my bees successfully during three years, and not a single colony has been lost during winter nor starved in early spring.

The cinnamon tree is placed by Editor D.-L. amongst the representatives of the Chilean flora, but this tree is unknown to us. What we have and Mr. D.-L. refers to, has nothing like the cinnamon tree, his mistake coming from the likeness in name in the Spanish language, i.e., Canelo (*Drymis chilensis*) and Canela (cinnamon-tree bark).—R. A. Sanhueza, in American Bee-keeper.

Crop Shorter than for Years.

The honey crop in this part of the country is shorter than for many years, but my 30 colonies are filling up nicely for winter from aster. C. H. MAY.

Page Co., Va., Oct. 13.

Results of the Season of 1899.

The following is my report for 1899: I started in the spring with 43 colonies, 30 of them in good condition and the balance from fair to very weak; five were queenless. They began to swarm June 10 and kept it up until July 9, and then they stopped swarming until some time in August, having increased to 77 colonies.

I had 30 colonies from Blue Mounds, Wis..

**23 cents Cash
paid for Beeswax.**

This is a good time to send in your Beeswax. We are paying 23 cents a pound—CASH—for best yellow, upon its receipt. Now, if you want the money PROMPTLY, send us your beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

the first consignment arriving July 28, which consisted of seven colonies. I put all of the colonies shipped this season on empty frames with foundation starters one-inch wide, and they filled their hives for winter.

I have taken 2,700 finished sections, and have about 1,300 unfinished to extract. My bees did nothing after Sept. 1, as the weather was cool and cloudy the most of the time. We have had fine weather here so far in October, but nothing for the bees to do except a little pollen-gathering.

ELMER C. NOLAN.

Midland Co., Mich., Oct. 12.

Not One-Fourth of a Crop.

Bees have not done well here this season. We will not have one-fourth of a crop. The spring was too wet and cold, with continued late rains. We hope for a better season next year.

G. D. LITTOOY.

Pierce Co., Wash., Oct. 12.

Our Offers on these Genuine WATCHES:

HOG CHOLERA

Save Your Hogs. SURE CURE and PREVENTIVE.

We have no medicine to sell, but have an effective remedy which will check the ravages of the plague and **save your hogs.** The disease is caused by a germ. This preparation is a powerful antiseptic which **destroys the germs** without injury to the hogs. The material can be obtained at any village store at the **cost of a few cents.** Any farmer can prepare and apply it. If used in time is a **certain preventive** and a **sure cure** for hogs not too far gone. **Full information** with directions are given in a very valuable work entitled—**"The Hog, by 15 Specialists"** which in addition to giving full details of this remedy furnishes information on every phase of hog raising and marketing by the most eminent authorities, experienced hog raisers and packers in the U. S. and Canada. To save the millions of dollars annually lost to farmers through this plague we dare to give this book the widest possible distribution and at the same time introduce to new readers **The NATIONAL RURAL AND FAMILY MAGAZINE, America's Great-est Farm Journal** for 40 years known as **The Western Rural.** Published weekly, 32 to 40 pages, fresh, up-to-date matter each week. Profusely illustrated. Subscription price \$1.00 per year. **Sample paper free.**

To send **The Rural** 13 weeks on trial (price 25c) and a copy of the above work (price 25c) to any address for only **25c. Coin or Stamps** **Club Offer:** For **\$1** we will send **5** copies of each. For **\$1.50** we will send **10** copies and a book, and a year's subscription to the club raiser free.

We Offer: Make up a club of 10 and thus assist in stamping out or preventing the swine plague from getting a foot hold in your neighborhood. Address **THE NATIONAL RURAL, Chicago, Ill.**

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Oct. 18.—The market is active and full quotations are obtained. A little fancy white sold at 16c, but sales are chiefly at 15c for the best grade; white, not strictly fancy, brings 13, 14 and 15c; amber grades range from 10@12c, and dark, 9@10c. Extracted, 7@8c for white, according to body, flavor and package; amber, 7@7½c; dark grades, 6@7c. Beeswax, 26@27c. **R. A. BURNETT & CO.**

KANSAS CITY, Oct. 19.—The demand for comb honey is fair, and supply light. The supply of extracted is light, and demand good. We quote No. 1 white comb, 13½@14c; No. 2, 13@13½c; No. 1 amber, 13½c; No. 2, 12½@13c. Extracted, white, 7@7½c; amber, 6@6½c; dark, 5@5½c. Beeswax, 22@25c. **C. C. CLEMONS & CO.**

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c per gallon. Beeswax quiet at 26@27c. **HILDRETH & SEGELKEN.**

CINCINNATI, Oct. 9.—The demand for honey, both comb and extracted, is very good, with prices much better than a few weeks ago.

Fancy comb finds ready sale at 15@16c; darker grades are hard to sell at any price.

Good demand for all grades of extracted. White clover and basswood brings 8@8½c; amber and Southern at from 6@7c. Good demand for beeswax at 26c. **C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth.**

We do not handle honey on commission—we buy for spot cash only.

BUFFALO, Oct. 20.—Supplies of strictly fancy 1-pound combs are lightest for many seasons; such are held firmly at 14c; few sales, 15c; No. 2, from 12c down. We do not notice any extracted in market. It is wanted at from 5c to 7c per pound. Beeswax, from 28@30c per pound for fancy pure yellow. **BATTERSON & CO.**

ALBANY, Sept. 26.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c. **MACDOUGAL & CO.**

Successors to Chas. McCulloch & Co.

BOSTON, Oct. 13.—We quote: Fancy No. 1 white in cartons, 15@16c; A No. 1, 14@15c; No. 1, 13@14c. Extracted, light amber, 7@8c; amber, 6½@7½c.

But little new to note in this market on honey. The supply still continues to be very short while the demand is naturally a little lighter, as the retail trade is not quite up to higher prices, still with the light stock they must evidently come to it. **BLAKE, SCOTT & LEE.**

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14@14½c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 8c. **PEYCKE BROS.**

DETROIT, Oct. 18.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8½c. Beeswax, 23@24c. **M. H. HUNT & SON.**

CLEVELAND, Oct. 18.—Fancy white, 16c; No. 1 white, 15c; fancy amber, 12@13c; No. 1 amber, 11@12c; fancy dark, 9@10c; White extracted, 8@8½c; amber, 7@7½c. **A. B. WILLIAMS & CO.**

WANTED.—Comb and extracted honey; state price, kind, and quantity. **R. A. BURNETT & CO., 33A13t 163 So. Water St., Chicago, Ill.**

WANTED. Fancy white comb honey in no-drip shipping-cases. State price, kind and quantity. **C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth 40Atf 2146 S Central Ave., Cincinnati, O.**

**The Bee-Keeper's
Guide**

Or, Manual of the Apiary,
—BY—
PROF. A. J. COOK.

460 Pages—16th 1899 Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with \$2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.
118 Michigan St., CHICAGO, ILL.

22nd Year **Dadant's Foundation.** 22nd Year

Why does it sell so well?

Because it has always given better satisfaction than any other. Because in 22 years there have not been any complaints, but thousands of compliments.

We guarantee satisfaction.

What more can anybody do? **BEAUTY, PURITY, FIRMNESS, No SAGGING, No LOSS, PATENT WEED PROCESS SHEETING.**

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BIOGRAPHICAL

Mr. Wm. A. Selser and Family.

SEVERAL years ago there called at this office, while unfortunately we were away, a gentleman from the East who left the name of "Wm. A. Selser." We had heard of him and regretted our absence from the office, especially when told by one of our employees that he seemed to be such a very pleasant man.

About two months before the Philadelphia convention, when again passing thru Chicago, Mr. Selser dropt in to see us for a while, and once more we were not in, but returned after our caller had waited a half hour or so. He could stay only about an hour longer, so we put in the time well in getting acquainted. But it seemed as if we had always been friends, and it was with much regret on our part that we had to separate so soon. And yet it was to be only a short time until we should meet again, as Mr. Selser exacted a promise that when attending the convention in Philadelphia we would be his guest.

And so, according to arrangement, at the close of the first evening's session of the convention, Sept. 5, Mr. Selser called together those whom he had expected to entertain, and we all took the 10-mile ride out to the beautiful suburb of Philadelphia where he lives. It was perhaps 11 o'clock when we arrived, and then met Mr. Selser's charming wife, who was "keeping a light in the window," as it were, for her beloved and his friends. And more than that, everything was ready for us all to sit down to the table and partake of a luscious water-melon and lemonade before retiring. On one or two evenings peaches and cream were served and such peaches and cream—why, our mouth waters even now when we just think of their deliciousness.

Perhaps before going further we ought to give a few personal notes concerning Mr. Selser and his family.

Wm. A. Selser was born Sept. 22, 1859, in the heart of the old city of Philadelphia, near the historic Independence Hall. He attended the common school, and then Philadelphia College, leaving the latter institution on account of sickness at the beginning of the closing term. He took special interest in zoology, particularly insects, which included bees, of course.

Mr. Selser learned the trade of tanner of morocco leather, but in 1877 entered a firm of fruit importers with his brother. In 1883 he left the fruit business and formed a partnership of Selser, Menner & Co., for the manufacture of morocco leather. They did a business amounting to three-quarters of a million dollars a year, and Mr. Selser kept bees as a pastime.

In 1893, Mr. Selser closed the morocco-leather business on account of the rascality of others, and embarked in the bee and honey business as a specialty, taking the Philadelphia branch of the A. I. Root Co. in connection therewith.

In 1889 Mr. Selser married Miss Pauline Hallowell, of Arlington, a daughter of one of the old Quaker families of eastern Pennsylvania, the descendants of Wm. Penn. Then he built a fine home at Jenkintown, moved there the same year, where a bright little boy was given them to love for one year, when he was taken from them by the Giver. Now a dear little girl of six years is left to cheer their daily life—Margaretta, whose picture helps to grace the next page. She and the writer became good friends, and it wasn't the easiest thing to tear one's self away from such a loving and lovely child as Margaretta.

Before passing on, we must also mention that Mr. Selser's sister and mother are also in his family, all being devoted members of the Baptist church. Margaretta's grandma is a sweet old lady, reminding us not a little of our own dear mother whom it was our great pleasure to visit in Ohio on our way back from Philadelphia.

Now as to Mr. Selser's bee and honey business: We believe he has the most complete honey-bottling works in the world. It is located right with his apiary (a picture of which was published on page 599), and perhaps 80 rods from his home. He uses two sizes of bottles—the one-pound and the half-pound, the same shape as the Muth bottle or jar. The honey is put in hot, then corked, sealed air-tight with a special kind of sealing-wax, and then a tin foil cap put on. A black label with gilt letters completes the job, and it makes a very attractive

William A. Selser.

Mrs. Selser.

as many bottles in a day as any three other girls, and do it better. There's a helpmeet that's worth her weight in—well, gold is too common to express it, so we'll let Mr. Selser fix her value.

Mr. Selser bottles only the finest white clover honey for his best grocery trade, and by adhering strictly to this rule he has built up an enormous demand, taking about 40,000 pounds a year to supply it. Quite a lot of honey to bottle, isn't it?

All the honey bought by Mr. Selser is carefully analyzed before using. And he is fixt to do that work, too, as he owns a polariscope costing \$250, a delicate balance or scales worth \$75, and all the paraphernalia of a complete chemical laboratory. You couldn't fool Mr. Selser on honey. He's an expert at analyzing it, and can spot any adulteration every time.

We are glad that Mr. Selser is succeeding in the honey-selling business. He deserves all the success with which he is meeting. But what he is doing in Philadelphia, it seems to us, could be done in almost any large city. Of course, it requires lots of energy, continual pushing, familiarity with bees and honey, and above and beyond all the finest grade of extracted honey. With the right man, the right methods, and the right honey, we believe success is certain almost anywhere.

THE EDITOR.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 67.]

Dr. Mason Figures such as Mr. Root has been giving us are not uninteresting, as he has intimated. I doubt not many bee-keepers have often wanted something approximately correct on this very subject, and these statistics are full of interest and meaning, and will give us something to go by when we want to talk to men in authority, such as legislators and other officials, and will help us to speak of the importance of our industry with some degree of accuracy.

The Secretary's Report.

Mr. President: Aside from the ordinary work of the secretary, I have but little to report. When one of our members gets into trouble with his neighbors, commission men, or with "the powers that be" he generally applies to our General Manager for advice and help, but occasionally one writes to the Secretary, instead, and where I have

package, indeed. The one-pound size retails for 25 cents, and the half-pound for 15 cents. Selser's honey is in great demand in the cities of Philadelphia and New York, Camden, and all the towns between. Grocers handle it exclusively, it being delivered to them by three large and elegantly painted and lettered honey-wagons, which are kept going constantly from Sept. 15 until the following May.

The honey for the season's trade is all bottled in one month—August—it requiring 24 hands to do the work, but Mrs. Selser herself does all the labeling. Mr. S. says she can label

thought I could be of service and accomplish what the General Manager might, I have not bothered him with the matter, but occasionally I have to pass the correspondence on to him and advise the complainant accordingly.

During the past year there have been two complaints about commission men made to me, one of which was satisfactorily adjusted, and the other is still unsettled, but there is hope of its being adjusted.

Complaint was made to me of probable trouble with a neighbor who claimed that the bee-keeper's bees were a great annoyance to him. I referred the matter to General Manager Secor, and I believe the trouble was averted.

During the time since our convention at Omaha last year, I have written 192 letters and 114 postal cards regarding matters relating to the Association, at an expense for postage and stationery of \$7.41; express charges and telegram, 60 cents; printing programs, \$5; total paid out, \$13.01.

I received for membership fees since last financial report to General Manager, Dec. 1, 1898, to Sept. 5, 1899, \$18; for programs and postage, 40 cents; total received, \$18.40. Balance in the hands of the Secretary, \$5.39.

Owing to the kindness and generosity of our friends, the members of the Philadelphia Bee-Keepers' Association, we have this nice hall, our beautiful badges, this fine piano and good music all free of charge, and you can all testify as to the thoro and generous manner in which our "inner man" has been provided for; and having had much correspondence with Mr. Halman in making arrangements for this convention, I wish to congratulate the Philadelphia association on having so active and efficient a secretary to represent and care for its interests; and I wish also in the name of this Association, to thank Mr. W. A. Selser and Mr. W. E. Flower for efficient services rendered in making this convention a pleasant and profitable one.

A. B. MASON, Sec.

Mr. Selser—From every hair of my head to the soles of my feet I am interested in bee-keeping, and I want to caution every honey-producer to be *very careful* about sending honey to commission men. They can very rightly say that honey has dropt in price. When you get quotations from them, and they say the price has dropt, don't be in a hurry to send your honey to them, altho they might be honest.

E. R. Root—You see by the Secretary's report that this Association stands ready to look after the interests of its members, and to defend them in their rights; Dr. Mason puts in his "bluster," and that settles it.

Dr. Mason—I don't like the way "Ernest" talks about my bluster. I *don't* bluster when trying to help our members when they get into trouble. I try to write in a brief but firm manner. I *don't* threaten. I have one case on hand now to settle, and the party has promist to settle.

Mr. Niver—Referring to Mr. Root's figures, I would like to carry it a little further. The average is \$33¹/₂ for each bee-keeper. I advise that we all go out of the business; some bee-keepers may have only one hive.

Mr. Selser—Out of 35 bee-keepers I am the only one who sells honey in Philadelphia.

Mr. Poppleton—I judge that this statement going out will give an erroneous idea. If the statement can be separated, I think it would be a good plan.

Mr. Root—These figures I got from the books. I was figuring on bee-keepers and farmers. The only accurate figures are regarding the sections.

Mr. Abbott—I sold ten carloads of goods, and I judge that not half the goods went to bee-keepers. Bee-keepers are scattered all over the United States.

The convention then adjourned until 1:30 p.m.

SECOND DAY. -- AFTER-NOON SESSION.

The afternoon session was called to order by Pres. Whitecomb.

As a preface to a paper written by Vice-Pres. C. A. Hatch, of Wisconsin, and read by Mr. York, Dr. Mason read the following letter:

Margaretta Selser.

DEAR DR. MASON:—I have prepared the enclosed article on honey-exchanges, but after it was prepared the thought occurred to me that it seemed rather terse and dogmatic in style, as if coming from one having "authority to speak," and as most of those who hear the paper will probably be entire strangers to me, perhaps a little explanation or showing of my right to speak would not be amiss, but to embody it in the article itself seemed to me rather on the line of boasting, and I thought it would be better to write you individually, and then let you offer any prefatory or explanatory remarks you see fit.

My experience with exchanges has been quite extended and varied for one person, having been a member of the Maricopa Co., Ariz., exchange, where I put a crop of 70,000 pounds into the exchange; also a member of the California exchange, with a crop of 28,000 pounds; also the Colorado exchange, of Denver, with a crop of 8,000 pounds, mostly comb; also a local fruit association here in Wisconsin.

So you see I have had opportunities not falling to the lot of many to know something of the good and bad points of exchanges. I believe in them thoroly, and these criticisms are not made to destroy confidence, but to help build on a surer foundation.

C. A. HATCH.

The following is Mr. Hatch's paper, on

Why Bee-Keepers' Exchanges Fail.

Trying to cover too much territory is one of the mistakes most common in organizing bee-keepers' exchanges; trying to do too much business, as, for instance, buying, selling, and manufacturing, when, perhaps, the whole membership are entirely without experience in any of these lines.

It would be much like a young man grown up and educated in the city, assuming to run a large farm; or a farmer's son with no experience trying to run a large commercial establishment. Practical knowledge comes by practical experience, and by practical experience only. Therefore, let us walk before we run, and learn to manage small affairs before we assume control of large concerns.

Making too many rules and restrictions is another hindrance to success. These may be well enough to catch rogues, but if your members are not honorable enough to act in a straightforward, honest business manner, restrictions, penalties, fines, etc., are poor substitutes for business integrity.

The most successful association I ever was a member of had not even a constitution nor by-laws; no officers were ever formally elected, no salaries paid, and yet it worked well for years, and is yet working. True, we had only five or six members, and therefore it was more easily managed than a larger number would have been. When supplies were to be bought a consultation was held, and each agreed to take a given amount, and one acted as purchasing agent, and actual cost and expenses were promptly paid by the members.

When a shipment of honey was to be made, one, not always the same person, acted as shipping agent. Each man's consignment was marked with his name, and the commission house, if sold on commission, or purchaser, if sold outright, was sent a list of the shipment, giving owners' names and amount sent by each, and the pay was sent direct to each shipper. This plan had two advantages—no treasurer was needed, for there was no funds held in common; and it made each shipper responsible for his shipment, and his only. Perhaps this plan is not applicable to a large number of shippers and great extent of territory.

One of the elements of success was the fact of our being near neighbors, so that a consultation of all the members could be had in a short time, which would be entirely lacking in a large membership.

Large membership dues are a hindrance rather than a help, by debarring some that would be desirable members, but who think they cannot afford the expense. A membership fee large enough to cover cost of preliminary work, such as necessary printing, etc., and not with an idea of creating a fund, is all-sufficient, say \$1.00.

Having dues like secret societies is much worse. One society of which I was a member had nearly \$300 standing against its members for unpaid dues. This amount will be looked upon by those owing it as so much money wasted, if called upon to pay up. And are they not right, for they have not received any use from the exchange, and therefore why pay any tax for its support?

Individual responsibility is the main thing in exchanges—the keystone that holds the whole arch in place—and the sooner the membership realize the facts that it is an or-

ganization "of the members, for the members," and that they are married to it for better or worse, the greater will be the success.

Members are too apt to put themselves in a hypercritical position, and criticize any and all acts of the executive board, as if it was their ordained mission to discover something wrong. This of itself creates an atmosphere of suspicion and mistrust, which is anything but helpful to the objects of the society. The probabilities are that the officers are having a hard enough time of it between the effort to get fair prices and the exactions of would-be buyers, without having those who should be their best supporters turn on them.

Let us be consistent. It is taken for granted that we have elected our best men for the responsible places, and after having elected them let us give them our unqualified support, for even a poor stick well supported may do better than a fine piece of timber with no support.

Stick together, whatever happens, and success is sure to be yours in the end. If a mistake has been made, make the best of it and try again. Condemn no man except for dishonesty or criminal neglect, and for such the sooner they are on the outside the better it will be for those left.

Have confidence in your particular exchange. Talk confidence to others, and see how soon it will be worthy of your confidence; and above all, show that your confidence is real, by putting all your crop into their hands, and not create suspicion by holding back part just to see how the thing works. It is sure to work well if you support it, and sure not to if you do not.

Do not be selfish, and want to run everything your way, but remember others want their way part of the time. Then after doing all this, do not expect every one you meet to remove his hat and bow down to a member of the Universal Honey Exchange; there are other enterprises in this world, and perhaps as huge undertakings as yours. And do not expect to control the universe—if you have your say in your little corner you will do well.

Railroads may be anxious to get your freight to carry over their road, but will hardly be willing to listen to your dictation. Rather learn a lesson from them, that a plausible, conciliatory manner is better than arbitrary measures.

To sum up: In starting, do not attempt too much—attempt only what you can carry thru. Do not have too many rules and regulations. Make the fee nominal, or nearly so. Do not work for profit, but to save expenses only. Be honest, be courteous, be careful, be confident, and, above all, be faithful to your society.

C. A. HATCH.

Dr. Mason—There are two other papers in the same line that might be read and all discuss together—"How to Conduct Successfully a Bee-Keepers' Exchange," by J. Webster Johnson, of Arizona, and one by Thomas G. Newman, on "Organization Among Bee-Keepers; If Desirable, Why and How Best Accomplish?"

Mr. Johnson's paper was then read by Mrs. Miller, as follows:

How to Conduct Successfully a Bee-Keepers' Exchange.

A bee-keepers' exchange is simply another name for co-operation among bee-keepers. Bee-keepers are producers, and the history of business as it is, and has been, shows that successful co-operative business ventures are not very numerous, but there are some that are entirely successful, showing that when conditions are right, and good business judgment is used in conducting the enterprise, co-operation can be made a success and be very beneficial to those who are connected with it. Then let us see first what are the conditions necessary to success.

1st. Co-operative action must be necessary in order that the producers who propose to work together shall be able to make their industry pay its best. For instance, a dozen bee-keepers living near a large town or city where all of their product can find ready sale at prices as good as could be obtained in any other market, will find little incentive to join forces, because each can readily dispose of his crop to as good an advantage as he could thru a co-operative concern. On the other hand, a number of producers with no home market of any size, and living so far from other markets that shipments must be made in carload lots if the freight is not to consume the bulk of the proceeds, cannot only co-operate to their mutual advantage, but really must do so if they are to obtain the best results, or, in some cases, any results at all.

2nd. Don't attempt to cover too much ground; in other words, co-operation should be undertaken only along those lines where it is absolutely necessary. When a number of

men are working together, differences of opinion will arise as to plans and methods, and right here is where the danger usually lies in co-operation, hence the less the number of things that are attempted the less friction there will be. So I lay it down as a general rule to begin with in conducting a bee-keepers' exchange, have only two main objects, namely, supplying cans or other packages for the honey, and marketing the product.

Some might suggest that the exchange should also furnish the members with their bee-supplies, and in some places this might be feasible, but here in Arizona we tried it once and did not consider it a success. To do anything in this line, supplies would have to be bought in carload lots, and, outside of hives, not enough things are wanted each year to make up a carload. In this valley so many different kinds of hives are used that it was found impracticable to make up a car. So, as conditions are here, and as they are in most places where co-operation will be of any practical benefit to the honey-producers, I believe that an exchange should only attempt to supply cans and market the honey.

Wherever there are located a number of honey-producers who, combined, produce honey in sufficient quantities to ship by the carload, I believe that successful co-operation is not only possible, but is really necessary in order to attain the best results. These producers must, of course, be located close enough together so that they can get together occasionally to direct the management, and so that their honey can be concentrated at some central shipping-point without too much expense. Given these conditions, a successful bee-keepers' exchange is not only possible but necessary.

The advantages to be derived thru co-operation, where conditions are favorable, are so apparent that I do not deem it necessary to take the time to set them forth, so I will proceed to give the essential details for such an exchange.

HOW TO ORGANIZE.

The best form for the organization is probably an incorporation. The articles of incorporation should expressly provide that only honey-producers are eligible to buy voting stock in the company, and that whenever any stockholder ceases to be actually engaged in the production of honey his share or shares of stock should not be votable at any meeting of the company unless it becomes the property of some honey-producer. This provision keeps the management of the organization in the hands of those who are personally interested. Then it should be provided that no proxy voting be allowed. This may work a hardship occasionally, but in the long run will be best. Those who have not enough interest to be present when properly notified should not complain, and my experience and observation in co-operative organizations show me that it will be best to allow no proxy votes.

To overcome the possibility of "no quorum," it should be provided that the secretary shall give each member notice by mail several days before the meeting, and where such notice has been given, five members (or some other small number) shall be qualified to transact business.

No considerable amount of working capital is advisable. First, because but little is needed; and, second, because the ownership of apiaries changes so frequently, and it would complicate matters very much if each share represented a considerable cash outlay. The purchase of cans is the only call for a considerable amount of cash, and for this it is better to arrange to borrow what is needed than to complicate matters by having a large capitalization. For these reasons the shares of stock should be sold at a low figure, say \$1.00 to \$2.00 each, and a person should be entitled to buy and vote one share for each 50 colonies of bees he owns, and no bee-keeper owning less than 25 colonies should be allowed a voting share in the organization (altho the product of the small producers should be handled for them when desired).

This plan fixes it so that each member's influence in the management is exactly in proportion to his interest, and this I believe to be the correct principle. Where the "one man, one vote" idea prevails, the man who produces a couple hundred pounds (and perhaps sells that at home) has as much influence in the selection of officers and in controlling the business of the exchange as the man who produces 50,000 pounds. This is not right.

Meetings of the general membership should not be attempted often, as, besides the election of officers, little should be attempted by the general meeting except to decide upon the general policy and methods of doing the business. The important officers are the board of directors,

five in number, and the secretary-treasurer, who is the business manager. The success of the exchange depends very largely upon the selection of the proper person for secretary and manager, as it will be necessary to allow him a good deal of discretion in conducting the business of the exchange. If the exchange covers a considerable scope of country, as it will in most cases, the directors will likely live some distance apart, and if the secretary is required to get the board together (which will usually take several days) before he can decide upon what action to take, a satisfactory business cannot be done. The board will have executive management, but the good judgment of the secretary must be trusted to a very large extent.

The secretary should be paid a fit sum, either per car of can of honey, or else so much per case, both shipped in empty, and filled with honey and sent out, that is, handled so that his pay will be in proportion to the work done. A fund for meeting the running expenses of the exchange is raised by a charge of a few cents per car profit on empty cans furnished, and a few cents per car of honey shipped. The number of cents per car will, of course, have to be regulated according to how much is paid the secretary, and what the other expenses are.

In the spring each shipper furnishes the secretary with an estimate of the number of cases of cans he will need for the season, if the crop is an average one. Then one or more cars of cans, according to the prospect for a crop, are bought and distributed proportionally to the shippers, as, for instance, if the total of the estimates be 5,000 cans, and 2,500 cases are bought, each one receives 50 percent of his order, and if the season is a good one more cans are bought later.

Some pay cash for their cans, but the majority get them on time, to be paid for out of honey shipped, paying whatever interest on the deferred payment that the exchange pays. Those getting cans on time sign a receipt which provides that the cans remain the property of the exchange until paid for, and agree to ship honey to pay for them, or pay the cash by the time the first shipment is made. This enables us to deliver the cans direct from the car, and so save all cost of storage, and has been found to be effective against loss.

MARKETING THE HONEY.

On the question of marketing honey, there will be differences of opinion as to the best plan, and no set rule can be laid down, but conditions and circumstances must be taken into consideration, and good business judgment be used. Some believe in selling only for cash, or its equivalent—on sight draft—at the point of shipping. Others believe that more money will be realized where shipments are made to reliable commission firms on consignment. Personally, I am of the opinion that this latter is the best plan, generally. There are times when as much can be realized by cash sales, but in general it may be said, I think, that under existing conditions more can be realized by selling on commission. In deciding this question we must consider not only present profit, but a market for future crops. One thing must be arranged for, no matter what may be the plan of selling, namely, to manage that all shippers shall receive the same amount per pound for honey shipped about the same time. I sometimes ship several cars at or about the same time, some of which sell more quickly than others, and some perhaps sell for more per pound than others. In this case, the first money received is paid prorata to all shippers, and when all returns are in, the average net price per pound is found and settlement is made on that basis.

Each shipper's honey is marked by having his initials on each case, and as each lot is weighed separately, each one gets paid for just what he ships.

As my paper is already longer than I expected to make it, I will close. The opinions set forth are drawn from an experience of several years in an association of bee-keepers here (in Arizona), and I trust that the ideas here brought before you may be of some value to our fellow bee-keepers in some places where the conditions are right for co-operative action among honey-producers.

J. WEBSTER JOHNSON.

(Continued next week.)

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

CONTRIBUTED ARTICLES

Some Big Honey-Yields Tabulated.

BY ADRIAN GETAZ.

THE following are some of the best honey-yields obtained, taking in the whole apiary :

- Mr. Gregg—Arizona. 200 colonies. Yield per colony, 485 lbs. Kind of honey, alfalfa and mesquite.
- E. France & Son—Wisconsin (home-apary). 61 colonies. Yield per colony (1885) 117 lbs. extracted, basswood and clover.
- Chas. Dadant & Son—Illinois. 87 colonies. Yield per colony, 141 lbs. extracted.
- Chas. Dadant & Son—Ill. 40 colonies. Yield per colony (1885) 113 lbs. extracted.
- Mrs. Axtell—Illinois. 80 colonies. Yield per colony (1882) 217 lbs. comb.
- L. C. Root—N. Y. 40 colonies. Yield per colony, 243 lbs. extracted of which 162 lbs. per colony in 7 days.)
- W. E. Thompson—Missouri. 7 colonies. Yield per colony (1890) 136 lbs. comb.
- N. B. Baldwin—Utah. Yield per colony (1890) 200 lbs., mostly extracted.
- F. McNay—Wisconsin. 175 colonies. Yield per colony (1886) 187 lbs. extracted. Increase to 230 colonies.
- J. E. Brooks—Iowa. 4 colonies. Yield per colony (1886) 150 lbs. comb. Increase to 9 colonies.
- Jas. Scott—Iowa. 88 colonies. Yield per colony (1886) 272 lbs. extracted. Increase to 109 colonies.
- G. D. Black—Iowa. 50 colonies. Yield per colony (1886) 260 lbs. extracted. Increase to 120 colonies.
- A. M. French—Michigan. 2 colonies. Yield per colony (1886) 244 lbs. comb. Increase to 7 colonies.
- Wm. Malone—Iowa. Yield per colony, 215 lbs. for the 6 years (1881 to 1886) mostly extracted; average yearly increase of 100 percent.
- Paul Viallon—Louisiana. Yield per colony, 200 lbs.
- R. Wilkin—California. 416 colonies. Yield per colony (1887) 185 lbs. extracted.
- E. France & Son—Wisconsin. (From 12 best colonies.) Yield per colony (1886) 164 lbs. extracted.
- W. Z. Hutchinson—Mich. 30 colonies. Yield per colony (1886) 140 lbs., nearly all extracted.
- O. O. Poppleton—75 to 100 colonies. Yield per colony, 110 lbs. during the last 10 years he was in Iowa.
- J. M. Long—Missouri. 4 colonies. Yield per colony (1888) 250 lbs. comb. Increase to 30 colonies.
- N. G. Adamson—Utah. 26 colonies. Yield per colony (1888) 195 lbs., $\frac{2}{3}$ extracted and $\frac{1}{3}$ comb. Increase to 48 colonies.
- John Blodgett—Missouri. 30 colonies. Yield per colony (1888) 193 lbs. comb. Increase to 75 colonies.
- L. A. Judd—Illinois. 5 colonies. Yield per colony (1888) 228 lbs., mostly comb. Increase to 20 colonies.
- S. I. Freehorn—Wisconsin. 23,000 lbs. extracted and 500 lbs. comb. Average for the 4 years ending 1886, from 250 to 300 colonies.
- Robert Quinn—Iowa. 150 colonies. Yield per colony (1888) 147 lbs., mostly extracted. Increase to 240 colonies.
- R. H. Rhodes—Colorado. 35 colonies. Yield per colony (1885) 143 lbs. extracted. Increase to 50 colonies.
- C. S. Adams—New York. 8 colonies. Yield per colony (1885) 200 colonies.
- R. J. Luthers—Michigan. 4 colonies. Yield per colony (1885) 213 lbs., mostly extracted. Increase to 9 colonies.
- J. G. Bundinger—Michigan. 8 colonies. Yield per colony (1885) 156 lbs. extracted. Increase to 30 colonies.
- G. D. Seitz—New York. 30 colonies. Yield per colony, 277 lbs.
- J. R. Case—Florida. (Apiaries moved to follow yield.) Yield per colony (1895) 420 lbs. extracted.
- J. R. Case—Florida (home apary.) Yield per colony (1895) 300 lbs. extracted.
- R. C. Aikin—Iowa. Yield per colony for the last 10 years in Iowa (1881 to 1891) 160 lbs. (For the best year of the above period, 227 lbs.)
- John Haskins—Missouri. Yield per colony (1889) 150 lbs.
- V. H. Young—Wisconsin. 50 colonies. Yield per colony (1894) 140 lbs., mostly extracted. Increase to 82 colonies.
- D. A. Wheeler—California. 900 colonies. Yield per colony, 133 lbs.
- H. E. Wilder—California. 120 colonies. Yield per colony, 200 lbs. Reported.
- Mr. Sagers—California. 300 colonies. Yield per colony, 133 lbs. in 1896.
- Mr. Oberlin—California. 140 colonies. Yield per colony, 274 lbs. extracted.
- Emerson Bros., California. 300 colonies. Yield per colony, 160 lbs. (The 5 above reports were probably the crop of 1895.)
- J. P. Israel—Calif. 16 colonies. Yield per colony (1884) 662 lbs. Increase to 60.
- T. O. Andrew—Calif. 40 colonies. Yield per colony (1895) 135 lbs. extracted.
- John Fox—California. 140 colonies. Yield per colony, 214 lbs. extracted.
- O. E. Harper—California. 74 colonies. Yield per colony (1895) 256 lbs. extracted. Increase to 154 colonies.
- E. T. Flanagan—Ill. 35 colonies. Yield per colony, 186 lbs. Increase to 70 colonies.
- Mr. Hammond—Iowa. Yield per colony, 127 lbs. comb and extracted.
- H. W. Funk—Illinois. 75 colonies. Yield per colony (1882) 2 67 lbs.
- Eastern Iowa Bee-Keepers' Ass'n.—Average yield (1889) 212 lbs., nearly all comb.
- G. B. Taylor—45 colonies. Yield per colony, 143 lbs. comb. Increase to 70 colonies.
- G. M. Doolittle—N. Y. 69 colonies. Average yield, 167 lbs., mostly comb.
- J. Z. Rhodes. 39 colonies. Yield per colony (1895) 154 lbs., $\frac{1}{2}$ comb $\frac{1}{2}$ extracted. Increase to 150 colonies.
- A Florida bee-keeper. 300 colonies. Yield per colony (1893) 100 lbs. (In Mangrove region.)
- An Australian bee-keeper.—63 colonies. Yield per colony (1892) 750 lbs. Increase to 120 colonies.

Another Australian bee-keeper reported in 1895 that one colony gave him 1,250 pounds; another colony, 1,120, and several others averaged 1,000 pounds. It must be remembered that in Australia bees gather honey almost the whole year, that is, if the season is good, which is not always the case, for the same man says that in 1894 he had only about 75 pounds per colony.

The above are the best yields obtained for one season and for the whole apiary. The reports are not always explicit, and in some cases it is possible that only a certain number of the best colonies were taken into consideration.

Very seldom the report says whether it is spring count or not, but it may be supposed that it is spring count, at least in the majority of cases. It seems that 1886 was the best year recorded.

To the above I will add the following best yields per single colony reported, giving the apiarist's name :

- Somebody in Texas—700 lbs., chiefly from horsemint.
- Doolittle—N. Y. 360 lbs. comb in 1877.
- " " 301 " " "
- " " 566 " ext'd in 1877.
- G. L. Head—384 lbs. extracted.
- R. A. Aikin—Iowa. 227 lbs. comb (obtained by removing the queen.)
- B. Taylor—Minn. 265 lbs. comb (the colony did not swarm.)
- N. B. Baldwin—Utah. 330 lbs. ext'd. (the colony did not swarm.)
- L. C. Root—N. Y. 361 lbs. ext'd in 1870 (Some of L. C. Root's colonies gave each 200 lbs. comb also in 1870.)
- J. Fennel—Ont. 390 lbs. comb in 1886.
- A. B. Mason—Ohio. 320 lbs. extracted.
- C. C. Miller—Ill. 195 lbs. comb.
- Dadant & Son—Ill. 450 lbs. extracted.
- Mrs. Harrison—Ill. 200 lbs., 112 lbs. from colony; 80 lbs. from swarm.)
- Mr. Maley—Nebr. 718 lbs. extracted in 1882 (from Cyprian bees.)
- Geo. Beandry—Can. 215 lbs. ext'd 1898.
- Paul Viallon—La. 392 lbs.
- Jas. Hodgdon—Mich. 410 lbs. all comb (but 48 lbs.)
- O. O. Poppleton—Iowa. 275 lbs. comb.
- E. E. Hasty—Ohio. 142 lbs. comb (in a poor location.)
- J. M. Hambaugh—Ill. 294 lbs. ext. 1888.
- E. L. Snyder—Wis. 570 lbs. ext'd 1889.
- H. Luthrop—Wisc. 235 lbs. comb. 1880.
- C. W. Dayton—Iowa. 462 lbs. ext. 1885.
- S. G. Wood—Aht. 172 lbs. comb. 1885.
- Baldensperger—Palestine. 178 lbs. ext. extracted in 1891.
- J. B. Crayon—Ohio. 218 lbs. comb. 1885.
- J. J. Earl—308 lbs. extracted in 1895.
- Vincent Quinn—150 lbs. in 1888.
- Dr. Gallup—Iowa. 750 lbs. (of which 650 lbs. was gathered in 30 days.)
- Mr. Hammond—Iowa. 188 lbs. mostly comb. (Same apiarist, 267 lbs. ext.)
- J. W. Bittenbender. 108 lbs. comb.
- Frank Goodale—Iowa. 208 lbs., $\frac{1}{2}$ comb, $\frac{1}{2}$ extracted, in 1886.
- J. W. Baldwin—Mo. 150 lbs. comb.

Like the reports for whole apiaries the above give very few details as to the conditions, size of colonies, etc. Mr. Doolittle gives a detailed report of the 500 pounds of extracted quoted above. The colony was good at the start, furnish with all the combs needed, had plenty of honey during early spring, did not swarm, and the brood was carefully spread during the proper season. Most likely the majority, if not all of the above yields, were obtained under ordinary management.

One colony belonging to Mr. C. Butman (Maine) gave, in 1881, 310 pounds extracted; in 1882, 340; in 1883, 340; in 1884, 45; in 1885, 300. That 45 pounds for 1884 shows what a difference exists between the yield for a bad season and a good season.

Another interesting item is the amount brought in in a single day, or about, by a single colony during a good flow :

A. I. Root reports 20 pounds in two days (10 pounds per day) by an artificial swarm; 43 pounds in three days (14 $\frac{1}{3}$ per day) during basswood flow; and in another case 18 pounds for a single day. Also a maximum of 10 pounds per day during white clover flow.

L. C. Root reported 4,103 pounds in seven days by 40 colonies, that is an average of over 14 $\frac{1}{2}$ pounds per day and per colony.

Mr. Doolittle reported 60 pounds in three days (22 pounds per day) from basswood.

R. Shipman, 72 pounds in four days (18 pounds per day) from Alsike.

Mr. Atchley, 521 pounds in 21 days (nearly 25 pounds per day) from Alsike.

Mr. Hambaugh reported 63 $\frac{1}{2}$ pounds in six days (10 $\frac{1}{2}$ per day); and from another colony 86 pounds in nine days (9 $\frac{1}{2}$ per day), both from Spanish-needle in 1889. That year from the same source 43 colonies gave him 2,021 in ten days (nearly 4 $\frac{1}{2}$ pounds per day). The same 43 colonies yielded the following year from the same source, 2,033 pounds, the best yield being 73 pounds in five days by a single colony (nearly 15 pounds per day).

We might also mention the colony of Dr. Gallup referred to above, which gave him 750 pounds during the season, of which 600 pounds were gathered in 30 days, making an average of 20 pounds per day. Evidently some days yielded more than 20 pounds, and some others less. The same remark applies to several of the above figures. For instance, when Mr. Atchley reports 521 pounds in 20 days it is not impossible that some days may have brought in even as much as 35 pounds. All these are maximums, we may say exceptional yields, as we can see by comparing them with the following.

This average honey-yield question was asked in Gleanings in Bee-Culture in 1887, and in the American Bee Journal in 1888, "What do you consider an average yield per colony?" Also in Gleanings in Bee-Culture in 1889, "What has been your average yield?" Again in 1898, in the American Bee Journal, "What do you consider an average crop for the last 25 years?" Here are the answers :

- Dadant & Son—Illinois. 1887—25 lbs. comb, 50 lbs. extracted; 1888—50 to 85 lbs.; 1889—21,000 to 22,000 lbs. yearly from 350 to 400 colonies during 10 years; 1898—about 50 lbs. extracted.
- A. B. Mason—Ohio. 1887—60 lbs. extracted.

Paul Viallon—Louisiana, 1887—75 to 100 lbs. comb; 100 to 125 lbs. extracted; 1888—50 lbs.; 1889—80 lbs. extracted.

W. Z. Hutchinson—Michigan, 1887—50 lbs. comb; 1888—about 100 colonies.

Jas. Heddon—Michigan, 1887—50 lbs. comb, 75 lbs. extracted, and 100 percent increase in number of colonies.

O. O. Popolton—1887, 110 lbs. extracted, in Iowa; 1888—110 lbs., mostly extr'd, in Iowa, 1898—Not more than 100 lbs. in Florida.

R. Wilkin—Cahla, 1887—85 lbs.; 1889—75 lbs., mostly extracted; about 300 colonies.

Mr. Doolittle—New York, 1887—75 lbs. comb, 150 lbs. extracted (but is on the decrease); 1888, 75 lbs. comb; 1889—80 lbs.; about 45 colonies, spring count; 1898—75 to 90 lbs.

A. J. Cook (in Michigan the first three answers; in California for the last); 1887—50 lbs. comb, 75 lbs. extracted; 1888—50 lbs. comb, 100 lbs. extracted (perhaps high); 1889—75 lbs. until the last 3 years; about 25 colonies, 1898—about 75 lbs. in California.

C. C. Miller—Illinois, 1887—304 lbs.; 1889—a little less than 40 lbs.; 200 colonies, 1898—From 25 to 30 lbs.

E. France—Wisconsin, 1887—103 lbs. extracted for the years 1883-1886 inclusive; 1889—100 lbs.; several hundred colonies; 1898—about 50 lbs. extracted.

E. E. Hasty—Ohio, 1887—below 20 lbs., in a poor location.

Mrs. Harrison—Illinois, 1888—25 lbs.

H. D. Cutting—Michigan, 1888—80 lbs., comb.

J. P. H. Brown—Georgia, 1888—40 lbs.; 1898—30 lbs.

Engene Secor—Iowa, 1888—30 lbs. comb, 100 lbs., extracted; 1898—50 lbs., if properly managed.

R. L. Taylor—Mich., 1888—35 to 40 lbs.; 1898—40 lbs. comb from good colonies.

J. E. Pond—Massachusetts, 1888—50 lbs. is perhaps high.

C. H. Dibbern—Illinois, 1888—40 lbs.; 1898—about 40 lbs. himself.

G. W. Demaree—Kentucky, 1888—50 lbs., not counting the last 3 years; 1898—40 to 50 lbs.

J. M. Hambough—Illinois, for the first answer, California for the last; 1888—40 lbs. comb, 75 lbs. extr'd; 1889—100 lbs. in the hands of good beekeepers.

H. R. Boardman—Ohio, 1889—45 to 50 lbs., leaving out the worst seasons.

P. H. Elwood—New York, 1889—40 to 50 lbs.

A. K. Mann—Vt., 1889—from 500 to 1,000 colonies; about 18,000 lbs. yearly from about 350 colonies during the last 10 years.

J. A. Green—Illinois, 1889—45 lbs., comb, 90 lbs. extracted; 1898—25 lbs.

J. H. Martin (while yet in the East) 1889—40 lbs., extracted, about 150 colonies.

The following correspondents answered only in 1898:

E. S. Lovesy—Utah, 60 to 70 lbs. W. G. Larrabee—Vt., 40 lbs.

Jas. A. Stone—Ill., 50 lbs. R. C. Aikin—40 lbs.

Mrs. J. M. Nall—Mo., 60 to 100 lbs., extracted; 35 to 60 lbs. comb.

Mr. F. Pettit—Ont., 125 lbs. extracted, if properly handled; 75 lbs. comb, if properly handled.

Rev. M. Mahin—Ind., 25 lbs., taking all bee-keepers into consideration.

D. W. Hesse—Ont., 60 lbs. for himself, but probably only 25 lbs. taking all bee-keepers into consideration.

The first thing that appears from these figures is how much lower is the yield now than it was 10 years ago. Why it is so would take too much space here to discuss, but the comparison between the 1898 column and the three others tells the tale at once.

Another point is clearly shown, that is, more honey can be obtained by working for extracted than for comb.

The most striking feature is the enormous discrepancy between the maximum yields and the average yields. For instance, Mr. Doolittle gives us a maximum of 560 pounds of extracted and 300 pounds of comb, and in one instance 60 pounds brought in in three days by a single colony, and then informs us that his average yield is only 80 pounds. Two causes contribute to the fact. One is the great difference between the colonies composing an apiary; this shows that our methods, or rather practices, of management could be improved; there is no reason why the bad colonies should not be as good as the best. The other is the difference between the seasons. As an illustration, the following from E. France & Son is striking:

1880—3,000 lbs. from 124 colonies, about 48 lbs. per colony.

1881—4,000 lbs. from 75 colonies, 54 lbs. per colony; increase to 157 colonies.

1882—13,000 lbs. from 411 colonies; increase to 235 colonies.

1883—22,000 lbs. from 211 colonies; 105 lbs. per colony; increase not reported.

1884—51,480 lbs. from 291 colonies; 100 lbs. per colony.

1885—30,970 lbs. from 321 colonies; 97 lbs. per colony.

1886—10,000 lbs. from 50 colonies sold; 200 lbs. per colony.

1886—42,480 lbs. from 306 colonies; 108 lbs. per colony; increase to 507 colonies.

1887—5,000 lbs. from 40 colonies; 12 lbs. per colony.

1888—11,824 lbs. from 131 colonies; 28 lbs. per colony; increase to 588 colonies.

1889—20,970 lbs. from 314 colonies; 49 lbs. per colony.

1890—3,125 lbs. from 60 colonies; 1 lbs. per colony; increase to 661 colonies.

1891—30,000 lbs. from 250 colonies; about 52 lbs. per colony.

1892—no surplus; 620 colonies; fed 14 barrels sugar.

1893—41,425 lbs. from 325 colonies; 129 lbs. per colony.

1894—3,700 lbs. from 120 colonies; about 30 lbs. per colony.

1895—no surplus; 1647 barrels sugar and killed 160 colonies to save breeding.

This from Mr. Stolley is perhaps still more to the point:

| YEAR. | No. of colonies, spring count. | Average Yield per colony, all extracted. |
|-------|--------------------------------|--|
| 1881 | 46 | 8 lbs. |
| 1882 | 44 | 23 lbs. |
| 1883 | 25 | 13 lbs. |
| 1884 | 48 | 77 lbs. |
| 1885 | 32 | 8 lbs. |
| 1886 | 71 | 117 lbs. |
| 1887 | 23 | 90 lbs. |
| 1888 | 21 | 79 lbs. |
| 1889 | 27 | 73 lbs. |
| 1890 | 26 | 44 lbs. |
| 1891 | 18 | 14 lbs. |
| 1892 | 31 | 30 lbs. |
| 1893 | 32 | 27 lbs. |
| 1894 | 23 | 2 lbs. |
| 1895 | 17 | 150 lbs. |
| 1896 | 26 | 116 lbs. |
| 1897 | 28 | 56 lbs. |

These reports need no commentary about showing the difference between seasons.

The following is R. C. Aikin's report (in Colorado) for 1890; swarming was prevented by removing the queens:

| | |
|---------------------------------|---------------------------------|
| 2 colonies gave 28 lbs. each. | 10 colonies gave 168 lbs. each. |
| 2 colonies gave 56 lbs. each. | 3 colonies gave 196 lbs. each. |
| 12 colonies gave 84 lbs. each. | 5 colonies gave 224 lbs. each. |
| 37 colonies gave 112 lbs. each. | 1 colony gave 252 lbs. |
| 44 colonies gave 140 lbs. each. | |

Only supers full (of 28 pounds each) were counted. The 135 colonies were increased to 285. The flow lasted only 50 days. Of the 2 colonies which gave only 28 pounds each, one swarmed and the other superseded its queen at the time she ought to have been laying the most.

The following is Mr. Jones' (an old correspondent of Gleanings in Bee-Culture) record of a hive on scales, and weighed daily during the basswood flow, three years in succession:

| 1889. | | 1890. | |
|---|----------------|--|-----------------|
| July 11 | gain of 7 lbs. | July 18 | gain of 15 lbs. |
| " 12 (wet day) | " 16 " | " 19 | " 16 " |
| " 13 | " 4 " | " 20 | " 16 " |
| " 14 | " 19 " | " 21 | " 8 " |
| " 15 | " 20 " | (Supers full and swarmed.) | |
| " 16 supers full | " 10 " | Total | 144 lbs. |
| " 17 | " 19 " | Average, 14 2/5 lbs. per day. Average yield for the whole apiary, 80 lbs., mostly extracted. | |
| " 18 | " 19 " | | |
| " 19 | " 26 " | | |
| " 20 | " 19 " | | |
| " 21 | " 22 " | | |
| " 22 | " 19 " | | |
| " 23 | " 21 " | | |
| " 24 | " 25 " | | |
| " 25 | " 9 " | | |
| " 27 | " 9 " | | |
| Total | 250 lbs. | | |
| Average, 10 2/5 lbs. per day. The average yield per colony for the whole apiary was 52 lbs., mostly comb. | | | |

| 1890. | | 1891. | |
|--|-----------------|---------------|-----------------|
| July 12 | gain of 14 lbs. | July 12 | gain of 12 lbs. |
| " 13 | " 16 " | " 13 | " 19 " |
| " 14 (supers full) | " 8 " | " 14 (rained) | " 15 " |
| " 15 | " 15 " | " 15 | " 12 " |
| " 16 | " 20 " | " 16 | " 24 " |
| " 17 | " 16 " | " 17 | " 24 " |
| " 18 | " 16 " | " 18 | " 21 " |
| " 19 | " 16 " | " 19 | " 16 " |
| " 20 | " 17 " | " 20 | " 17 " |
| " 21 | " 13 " | " 21 | " 13 " |
| Total | 149 lbs. | Total | 149 lbs. |
| Average of 16 lbs. per day, leaving out the 14th. Average yield for the apiary, 83 lbs. per colony, extracted. About 150 colonies. | | | |

Mr. E. E. Mercer's colony on scales (in an 8-frame hive) gave for 1890 in California:

| | | | |
|--------------------------------------|-----------------|------------------------------|--------------|
| April 15 | 2 lbs. gain | May 15 | 12 lbs. gain |
| " 16 | 3 1/2 " | " 16 | 16 " |
| " 17 | 3 " | " 17 | 18 " |
| " 18 | 1 1/2 " | " 18 | 19 1/2 " |
| " 19 | 1 1/2 " | " 19 | 24 " |
| " 20 | 1 1/2 " | " 20 | 63 1/2 " |
| " 21 | 1 " | " 21 (lost ext d 6 1/2 lbs.) | 63 " |
| " 22 | 4 " | " 22 | 84 " |
| " 23 | 4 " | " 23 | 13 1/2 " |
| " 24 | 4 " | " 24 | 10 " |
| " 25 | 7 1/2 " | " 25 (log) | 10 " |
| " 26 | 2 1/2 " | " 26 (log) | 4 " |
| " 27 | 6 " | " 27 (log) | 7 1/2 " |
| " 28 | 6 " | " 28 (log) | 7 1/2 " |
| " 29 (cold weather, lost 1 1/2 lbs.) | 1 lb. | " 29 | 8 " |
| " 30 | 1 lb. | " 30 | 8 1/2 " |
| May 1 | 3 1/2 lbs. gain | " 31 | 23 1/2 " |
| " 2 | 8 1/2 " | June 1 | 7 1/2 " |
| " 3 | 9 1/2 " | " 2 | 6 1/2 " |
| " 4-6 lbs. gain; ext'd 50 " | | " 3 | 7 1/2 " |
| " 7 (log, lost 1 lb.) | 10 " | " 4 | 10 " |
| " 8 (log, lost 1 1/2 lbs.) | 5 1/2 " | " 5 | 10 1/2 " |
| " 9 | 5 1/2 " | " 6 | 12 1/2 " |
| " 10 | 10 1/2 " | " 7 | 12 1/2 " |
| " 11 | 11 " | " 8 | 14 " |
| " 12 | 11 1/2 " | " 9 | 14 " |
| " 13 | 11 1/2 " | " 10 (lost ext'd 50 lbs.) | 12 " |
| " 14-12 lbs. gain; ext'd 6 lbs. | | " 11 | 12 " |
| | | " 12 | 12 1/2 " |

Total during that period, 351 pounds. From June 12 to July 20 there was a gain of 1 1/2 to 2 pounds per day.

All the above items are taken from Root's "A B C of Bee-Culture," Prof. Cook's "Bee-Keeper's Guide," the American Bee Journal from 1888 to date, Gleanings in Bee-Culture from 1886 to date, and the Bee-Keeper's Review.

Knox Co., Tenn.

Notes on Cuban Bee-Keeping.

BY HARRY HOWE.

BEE-KEEPING in Cuba is not so very much different from bee-keeping anywhere else. The most important difference is the time of year for the various operations. At present the routine work seems to be about like that for June in New York. It consists in building up nuclei, swapping brood for honey, and honey for brood, spreading brood, etc. Here, where the nights are always warm, one can spread brood without much danger of chilled brood.

There is not enough honey as yet in the fields to keep the bees breeding as much as I like, so I am practicing stimulative feeding by putting out honey at one side of the apiary, as I have done at home for several years. Some have thought that the neighbors' bees would get some of it,

but I do not think they do. The feeding is done at a time when the bees do not fly very much, nor very far from home. Besides, I find that my neighbor here is a pretty good sort of fellow, the same as he was in New York, and if his bees should benefit slightly by my feed, it is not a State's-prison offense. There seems to be a difference in locality, even in Cuba.

My three apiaries are in a row along one of the main government roads. One is three miles north of home, and the other out-apiary eight miles south. At present the north apiary—Lucado—is getting no honey. The home-apiary—Paula—some; and the south apiary—Dique is storing some surplus.

When I came here Senor Ranelo had not visited the Dique apiary in three months. Upon my first visit I found one colony which some one had evidently tried to extract, and gave it up as a bad job. The cover was off, and the top story set crosswise upon the bottom story. Yet there was brood in both stories and plenty of honey. This during the rainy season, and in a large apiary where robber-bees are always looking for plunder, shows that bees will sometimes stand. They were black bees, at that.

There are almost no fences left here, and but a small share of the houses left standing. Thousands of acres that were farmed before the war are now used for cattle-ranges. In many cases it is not even known who owns the land. Often entire families perished where they were driven from the farms into the villages, while the Spaniards spent the months they were given to get out of Cuba, in destroying the records of the land transfers. Even the stones used to record the surveys at the corners of the sections have the inscriptions effaced in many cases. Everything of value they could not take away with them seems to have been wantonly destroyed.

My employer here can read a little English by means of a grammar and a dictionary. He is a warm personal friend of Mr. Craycraft, and when the copy of the American Bee Journal containing Mr. Craycraft's article read at the Philadelphia convention came to hand, he wisht to read it. It was his first attempt at the amended spelling. When I came in he was tearing his hair and using all sorts of language towards a dictionary which, he said, did not have all the words in. My knowledge of Spanish was not equal to the task of explaining how it was that there should be two ways of spelling one word.

Senor Ranelo has a Spanish bee-paper which appears to be pretty good. Provincia Habana, Cuba, Oct. 10.

Planting Trees for Honey—Some Suggestions.

BY J. H. MARTIN.

WHEN living at the old home in eastern New York I was in daily contact with specimens of such noble trees as the basswood, sugar-maple and elm; and the drooping-willow grew to perfection on the old homestead farm. The public highway ran thru it for a distance of about 80 rods, and it was once my desire to make that 80 rods a beautiful avenue; and when opportunity offered I planted trees, both basswood and maple. Those trees have been growing for more than 20 years; and I have assurances from parties who live near them that there is now a fine avenue, with but few bees near to gather the honey. Certainly, a score or more of basswood trees along the roadside would amount to but little for the operations of a large apiary, but if farmers could become interested in tree-planting there would be a chance for more bee-keeping later on.

My ideas in relation to tree-planting had been definitely formulated and settled long before I left the East. There is scarcely a farm in the hill country of eastern New York and the New England States without more or less waste land upon it. The steep and stony hillside has been denuded of trees, what little fertility the land possess has been exhausted from repeated croppings, and now it is turned over to stones and weeds, and called the "back pasture." Upon this same barren hillside the tree will grow, and in its thrift will draw moisture to the surface, and perhaps the long-forgotten spring will come to life again.

I have seen many hillside that were naturally moist, or which had a fringe of springs upon their lower edges, made as dry as a bone from the free use of the woodman's axe. When the spring fails, the little stream diminishes, the river a little farther down becomes sluggish, sandbars appear, and navigation ceases—all a result from the denuded hillside.

It seems to me that the remedy for these evils is very simple. Nature has been thrown out of balance, and we must get her back. In order to get her back we must ask Nature a few questions. Nature says that the shade of the tree is necessary for the continuous flow of the spring; and how lovingly the willow performs her part; and where the trout-brook winds its way thru the meadow, the clover and the grasses grow with such vigor, and intertwine from bank to bank if possible, thus shielding the water from the rays of the sun, and preventing evaporation. Wherever the land is not too valuable, these springs and little streams can be protected by the planting of trees. The willow, locust, basswood and the maple would be agreeable to the bee-keeper, and perform the work of making shade. The locust tree alone would make a rapid growth, and in a few years the grove could be trimmed out at a profit for wood or fence-posts. The sugar-maple would make fair returns from its honey and sugar, while the basswood would bear thinning out within 20 years for its white lumber. Going a little further, is there not a benefit in the judicious planting of trees even where the land is valuable?

The ten acres planted by Mr. Root was upon poor ground, but, according to his confession, if he had been as enthusiastic in forestry as he is in gardening, the result would have been different in spite of the lack of drainage.

The basswood and the locust will make a good growth in ten years, and produce quite an amount of honey, and, as the years pass, the tree-top acreage will increase.

The planting of trees for the honey they will secrete is a matter of wide application; and here in California some of our bee-men are alive to its importance.

Here, where so much depends upon the conservation of the water supply, the government comes to our aid, and has set off large tracts of our mountain lands into government parks. Our large timber grows upon these mountains; and but for the timely interference of the government, the woodman's axe would leave them as barren as a desert. Associations, with men of wide experience in forestry, are in active operation; and when the planting of trees is in progress the bee-man is remembered in the planting of the eucalyptus. The basswood will grow in California, and a judicious planting of it in favored locations on the mountains would surely result in benefit.

We hope the time will come when we shall learn to cultivate Nature, as seen in the animal, the tree, the fountain, the flower and the insect, and there will be harmony among them all. We have much to learn, and many questions to ask of Dame Nature, but she will not fail us if we ask unselfishly and listen patiently.—Bee-Keepers' Review.

Los Angeles Co., Calif.

The New (1899) Edition of ABC of Bee-Culture, just revised, is indeed a fine work, very interesting descriptions of which have been given on pages 603, 619, and 635. It is a book every bee-keeper should read thoroly. The regular post-paid price is \$1.20, but to all our subscribers who pay any arrears that may be due, and also \$1.00 for the Bee Journal for 1900 (next year), we will mail a copy of A B C of Bee-Culture for only 75 cents, provided the order is received before January 1, next. We make this same offer to all who have paid their subscriptions to the end of 1899—send us \$1.75 and we will mail you the book and credit your subscription for 1900. We make the same offers on "Langstroth on the Honey-Bee," revised by Dadant (1899 edition).

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

GEORGE W. YORK, Editor.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. NOVEMBER 2, 1899. NO. 44.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Keeping Honey-Customers Supplied.—While it is true that honey is now much higher in price than for several years, there are plenty of people who are willing to pay the advanced price for the genuine article.

Where the crop has been short, or no crop at all, it certainly will pay the honey-producer to supply his local trade, even if he must send away for the honey, and then handle it on a very small margin of profit. In the future it will be found to have paid well to take care of customers just the same in a year of short honey crop as in a year of plenty.

While there is not very much honey offered, still there is some, and there will likely be enough so that all who want it can have at least a little. Better see to it that your own trade has a chance to have some if they want it.

Necessity of Pure-Food Legislation.—Mr. H. D. Murry, of Mississippi, sends us the following in reference to the address of Rev. E. T. Abbott, which we publish on page 660:

MR. EDITOR:—Enclosed find 10 cents for which please send me an extra copy of the American Bee Journal of Oct. 19, 1899. I want to send it to our congressman and call his attention to Rev. E. T. Abbott's paper on the "Need of Pure-Food Legislation." Our congressman is a personal friend of mine, and I hope to secure his support of the Brosius Bill.

I would like to ask every bee-keeper in the United States to make a similar effort. The trouble is, we are too prone to wait for some one else to act. We are too modest. We can rest assured the adulterators are not going to be over-modest in their efforts to defeat the Bill.

If every bee-keeper who is acquainted with his con-

gressman will make an effort, our influence will be felt. It is a righteous cause, and they will not dare oppose it if they are given to understand the eyes of the people are upon them.

Please stir them up in the American Bee Journal along this line, and let us have "a long pull, a strong pull, and a pull all together," and we will land that Bill, dead sure. Let us know no such word as "fail."

Yours truly,

H. D. MURRY.

Mr. Murry is on the right track. Others will do well to follow his good example. We have perhaps 200 extra copies of the number of the American Bee Journal with Mr. Abbott's excellent address, and will furnish them free as long as they last, if those who can use them to good advantage will drop us a postal card asking for them for this purpose. We think a good way to do would be to cut it out and enclose it with a personal letter to your congressman. He would be more certain of getting it in that way, and more likely to read it. Perhaps some, however, can hand it to their congressman and put in a strong word with it.

There is no doubt that bee-keepers can help much in securing the passage of the Brosius Bill. Let all do all they can. Perhaps it wouldn't be a bad idea if the officers and board of directors of the United States Bee-Keepers' Association would get up a short address on the subject, and mail it, with their signatures, to every senator and representative in Washington, as soon as congress assembles, or just before the Bill comes up for debate and passage.

Honey for Breakfast is becoming the style down at the nation's capital—Washington. So said Mr. Danzenbaker at the Philadelphia convention. He was urged to encourage the spread of that "style" as much as possible.

Honey is on our table at every meal, but this particular boarder does justice to it only at the noon and evening meals, unless there are pancakes on hand for breakfast, when it "goes" all right then, too; and we don't seem to tire of it. But who could tire of fine alfalfa honey? One might as well think of tiring of bread, butter, and potatoes, as to tire of alfalfa extracted honey.

We think bee-keepers' families ought to eat more honey and buy less sugar. The family of Hon. Eugene Secor, we understand, believes thoroly in home consumption of honey, for it takes something like 800 pounds a year to supply them, we believe. There are eight in his family, thus making about 100 pounds for each annually, or a little over a quarter of a pound a day. We presume they have adopted the Washington style, and perhaps have added thereto the other two meals.

The Buckwheat States, in their order of acreage devoted to its growing are, New York, Pennsylvania, Maine, Michigan and Wisconsin. Of course, naturally, the bulk of the honey-yield therefrom would be in the East. Very little buckwheat honey comes to this market. Chicago is probably the largest consumer of alfalfa and sage honey, the latter being preferred by the manufacturers, especially bakers, who want a strong-flavored honey.

Passing of the Commission Man.—We were recently talking with a representative of a commission firm dealing in butter and eggs on South Water street, and he assured us that the commission man had had his day. "Why," he said, "there is very little produce consigned these days—nearly everything is sold for cash before it leaves the producer's hands. And this change has all come about by reason of the swindlers in the commission business. Farmers are getting so they just won't trust any one with their products without knowing in advance what they are going to realize for them."

He referred also to the stealing of C. R. Horrie & Co.

here a few years ago, and how the American Bee Journal helpt to drive out such concerns that were fleecing bee-keepers. Another was Geo. T. Wheadon & Co., said to have been backt by Terrill Bros., all of whom are out of the business now, having made their "pile," we presume, and also on account of its getting "too warm" for them where they were doing business.

We are glad that all business is coming more and more to a cash basis—pay cash and get cash. Some one has well said, "Pay as you go, or else don't go." It's a pretty good rule to follow, if at all possible.

Prettiest Bee-Yard Yet Shown is what Mr. "Stenog" says in Gleanings in Bee-Culture in referring to the one shown on page 625 of this journal. Here is his whole comment and "commend:"

Mr. York is introducing pictures more and more into his excellent journal, and I commend him for it. On the first page of his issue for Oct. 5 is given a view of what I deem to be the prettiest bee-yard yet shown. It belongs to F. G. Herman, of New Jersey. It is a veritable little park, and Rambler's "muse" prompts one to say:

I'd like to be a honey-bee,
And fly around that park;
I'd visit all the flowers bright,
And fill my combs by dark.

Thank you, Mr. "Stenog," for your words of commendation, and poetical musing. We are glad to know that you are able to find occasional "Pickings" in our "Field." Pictures in bee-papers are getting to be quite a feature. The great advance in the past few years in all classes of magazines in this respect has been very markt. Often a single glance at a picture will give one a more clear idea than a long wordy description. Considering the character of Gleanings in Bee-Culture pictorially, and his connection therewith, "Stenog's" opinion may be counted of some value.

Packages for Retailing Extracted Honey.—R. C. Aikin, in the Progressive Bee-Keeper, thinks that lard-pails are fine for the general trade in extracted honey. The pails are piled up and left till the honey is solid as lard, then it is ready to sell. Editor Doolittle also wants the honey candied, but is enthusiastic over boxes as packages for extracted honey. Five-pound boxes are made of 3/8 stuff, 10-pound boxes of 1/2 stuff (likely those two dimensions should change places), 25-pound of 1/2 inch, 50-pound of 3/4 inch, and the 100-pound box of inch stuff. The box is coated inside with paraffine, filled with its proper weight of honey and a little extra for waste and good measure, a piece of paraffine paper is put over and the cover laid on, and when it is candied it is nailed up and is ready for shipment. If a box is broken there is little loss. Advantages are, cheapness, solid packing, and a lower freight rate.

To Whiten the Neck. Mr. J. N. Ladenburger, of Hamilton Co., Ohio, sends us the following clipping for the "fair sex:"

When the neck and throat have become brown or yellow looking they may be whitened by the persistent application every night of the following paste, spread on a soft rag and wrapt around the neck: Honey, one ounce; lemon-juice, one teaspoonful; oil of bitter almonds, six drops; the whites of two eggs. Add enough fine oatmeal to make a smooth paste.

The Genesee County Bee-Keepers' Society was organized at Batavia, N. Y., Aug. 31. The officers elected are: F. H. Fargo, president; vice-presidents, R. R. Pierson, G. W. Young and F. L. Watton; Secretary, O. J. Gardner, of West Bethany; and treasurer, H. H. Fisher. We wish the new organization all the success possible.

A German Foul-Brood Circular has been issued by Mr. N. E. France, the efficient foul-brood inspector of Wisconsin. We presume there are so many German bee-keepers in that State who are unable to read English that it is really necessary to "sprechen Deutsch" to them in order the more effectually to destroy the foul disease among bees.

The Weekly Budget

MR. THOS. WM. COWAN, editor of the British Bee Journal, as most of our readers know, is living now in California (Monterey County). In a letter received from him dated Oct. 18, he says:

"We have been enjoying this place very much, and I have certainly never been anywhere where the climate is so agreeable. The thermometer has ranged all the summer

Mr. Thos. Wm. Cowan's California Home.

between 55 and 70 degrees, and only last week did we get it up to 78 degrees. Mrs. Cowan has been wonderfully well, and it has done me an immense amount of good.

"I am sending you a photograph of our place here, so that you may have some idea of the vegetation. You see we are surrounded with palms and other tropical or semi-tropical plants."

We are very glad indeed to know that our good English friends are enjoying their sojourn in our Western climate, and among our people. We hope they will conclude to remain permanently. "Uncle Samuel" will be delighted to adopt them, and as many more like them as will come over our "Eastern Pond."

But no wonder Mr. and Mrs. Cowan are well and happy in such a lovely place as is shown in the picture sent us, and which we take pleasure in showing to our readers. All it lacks is a few colonies of bees on that beautiful lawn a few rods west of the mansion.

THE HUMANE ALLIANCE.—A four months' subscription to The Humane Alliance, the handsome illustrated magazine of animals and pets; a neat book containing a charming story of an animals fidelity and showing man's inhumanity to man; also an interesting book on the subject of Humane Education, will be sent free, for 10 cents to cover the cost of forwarding. The Humane Alliance, 127 East 23rd St., New York, N. Y.

MR. JOHN H. MARTIN, of Los Angeles Co., Calif., writing us Oct. 21, said:

"We have had a nice rain, and the fields and the mountain sides begin to respond to the moisture by putting on a green hue. Judging from the rainfall in the past, we are sure of a bountiful amount of water the coming winter."

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

We deal almost exclusively in honey, giving it our closest attention all the year round.

We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.

We are acquainted with the most desirable trade thruout the country, and know exactly what their wants are.

We know, thru our long experience, the different varieties and qualities of honey: therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?

We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

HILDRETH & SEGELKEN,

120 and 122 West Broadway, NEW YORK CITY.

Shade vs. Sunshine.—A. Norton, in Gleanings in Bee-Culture, while not disputing what may be in other places, says:

"It has been my experience, the result of extended observation in various parts among the coast valleys of California, that bees in the shade are invariably as cross as can be endured, when the same bees in the warm sunshine will be tractable. Moreover, the honey will be sealed over in a thinner or less ripened state in the shade. The reason of both conditions is not hard to seek. Shade, then, is eminently a question of locality."

Shade for Hives is considered a source of profit by the Wilson Bros., of the Kickapoo Valley, Wisconsin. For two years they have been making observations on this point, and they think that shade increases the surplus about one-fifth. Their idea is that the intense heat upon the walls of a single-walled hive drives the bees from the hive to a certain extent upon hot days. Herbert Clute told me that he secured more honey from colonies in chaff hives than from those in single-walled hives. I related these views to C. A. Hatch, of Richland County, Wis., and he took opposite views. The Wilsons prefer trees for shade. Box-eiders grow quickly and make a nice tree. —Bee-Keepers' Review.

Hungarian Bees.—The Banater or Hungarian bee, says Baron Bela Ambrozic, occupies an intermediate position between the Italian and Carniolan in swarming propensities, and also in brood-rearing and storage of honey in the brood-chamber. The colonies do not become weak in a pro-

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 20 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now 7 and 11 miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Root's Column

—THE—

*** ABC ***

—OF—

Bee = Culture.

Revised in 1889 by E. R. Root.

Only one month since it came from the press, but nearly EIGHTEEN HUNDRED COPIES sold. No other American work on this subject is kept up to date like the ABC of Bee-Culture.

See what the senior editor of the British Bee Journal, published in London, says:

"I must thank you for your kindness in sending me a copy of your new edition of the ABC of Bee-Culture, which I have cursorily pursued with great pleasure. I see there is a great deal of new matter introduced to the advantage of the book.

Your plan of revising every edition and eliminating obsolete practices and appliances is a very good one, and it is the only way to keep up with the times because a few years make such a change in bee-keeping, and those books written 8 or 10 years ago are quite obsolete. There are only three books that I know of that are issued on the same principle, and these are your ABC of Bee-Culture, Bertrand's Conduite du Rucher, and my guide-book."

Yours very truly,

THOS. WML. COWAN.

For sale by all dealers in Bee-Keepers' Supplies. Price, \$1.20, postpaid. If sent with other goods by freight or express, not prepaid, \$1.00. Clubbed with Gleanings in Bee-Culture one year for \$1.75, all postpaid.

THE A. I. ROOT CO.
MEDINA, OHIO.

longed flow as Italians do, while at the same time they store enough for the future. Its only fault is its inclination to rob, and to fly for nectar in bad weather, when numbers often perish. Since 1873 he has shipped nearly 6,000 colonies and 8,500 queens to nearly all the countries of Europe and America, and from Russia to Illinois, Ohio and Kentucky, and it has met with great favor. It is gray, with yellowish abdominal rings and yellowish down, and somewhat slenderer than the Carniolan, and it has a direct flight, while that of the Carniolan is waving. The best colored examples are in southern Hungary; those from the mountainous regions are much darker.—Bee-Keepers' Review.

Reversing Extracting - Combs Quickly.—Messrs. Coggshall and Howe have a rapid method of reversing the combs when extracting. There are two combs in each basket, with a sheet of tin between them. The honey from the inner comb is thrown against the tin and runs down just the same as tho it had been thrown against the inside of the extracting-can. To reverse the combs, a comb in the basket farthest away is grasped with the left hand, and one in the nearest basket by the right hand, then they are lifted up and quickly exchanged without any turning about. The comb from the far basket is put down in the near basket, and vice versa. This obviates any turning around of the combs, and two are moved at the same time. Mr. Coggshall prefers to have shallow combs go into the basket the same way as they hang in the hive, as they can be reversed with less motion.—Bee-Keepers' Review.

The Price of Plain Sections.—One of the arguments in favor of plain sections was that, taking less lumber and labor than the old style, they would cost less. So far they have been sold at the same price. There may be justification for this on the ground that a manufacturer who has been at some pains to introduce them should have some reward therefor. But one can hardly see why those who have made no effort for their introduction, and especially those who have opposed them, should be thus rewarded. Yet all alike sell the plain sections at the same price as the old-style, the manufacturers being the only ones benefited by the change. According to Gleanings in Bee-Culture, however, a change is likely to come. The editor says:

"Since basswood timber, like all other timber, is advancing so sharply—nearly a third—it begins to look as if there ought to be a difference in price between plain sections and the old-style with bee-ways; for the latter, taking more timber, and more labor to make, of necessity cost more.... There will probably not be much difference in the price the coming season, altho it is plain that, when plain sections come more into popular favor, they will have to be sold for less money. Our own books show that they are working that way."

Bee-keeping in Greece.—Gleanings in Bee-Culture says that a correspondent of the Revue Eclectique, in writing from Greece, gives the following:

"From the most remote antiquity, and even before all civilization, Greece was a country essentially honey-yielding; and even down to our times the honey harvest in Hellenic countries has had a celebrity that no other rival product has been able to share; for the abundance and especially the richness of the flora of certain localities favor in an especial manner this agricultural industry.

"Nevertheless, in spite of the exceptional situation of Greece, it is to be noted that the honey-production of that State does not exceed 8200 000 in value, and this does not suffice for home consumption. On the other hand, the celebrated honey of Hymettus, once gathered upon the mountain of that name, is produced no more. Grecian honey, the superiority of which is due essentially to its aroma, and to its fine fla-

vor and nutritive properties, sells in Athens at from 37 to 45 cents a pound.

“There is also another kind of honey called *rodomele*, or honey of roses. The colonies that produce this honey are situated in the province of Carystie, in the Eubœa—regions which are covered with wild roses, from which the bees gather honey.

“The honey produced by the juices of these plants exhales a perfume of roses that is very markt. It is sent principally to Constantiuple, where it is sold at a very high price to Turkish families, who use it for cooking, and for seasoning their pastry. Wax is worth from 37 to 45 cents a pound.”

Insects Fertilizing Blossoms.—

In seven localities in Austria, last year, experiments on the fertilizing of fruit-blossoms were conducted according to a concerted plan on a variety of trees and shrubs, choosing those that had not borne much the preceding year. In one locality apple-blossoms covered from insects bloomed one to three days longer than uncovered ones; pear-blossoms four to five days longer; and plum-blossoms four to six days. No fruit set on the covered apple-boughs, and less on the covered pear and plum boughs than on the uncovered ones, much of which fell off prematurely. In another locality the experiment was tried on an almond tree, a pear and a cherry, which bore fruit in abundance on the uncovered branches. All the covered blossoms remained in bloom longer, but none developed except one of the almond blossoms, apparently because it rubbed against the covering, and this withered without a kernel. In the third locality, two covered apple boughs bloomed three days longer than the others, and no fruit developed, while the uncovered branches bore in abundance. In the other four localities the experiments and results were so similar it is not worth while to mention them particularly. The whole forms a convincing proof that insect aid is necessary to the fruit industry.—Bee-Keepers' Review.

GENERAL ITEMS

A Conqueror.

Noble is he whose moral strength
Beats down the walls of wrong,
Whose honest manhood uplifts man,
Whose life is like a song;
The brave and steadfast conqueror
Of appetite and sin,
He flings hope's stately portals wide,
And bids the lost come in.

ROSE HARTWICK THORPE,
in Demorest's Magazine.

Plenty of Stores for Winter.

Bees have been booming on asters for the past two weeks. They will have plenty of stores to winter on, and I think some to spare. The early honey crop was very short, but of fine quality. J. S. WORLEY, Maury Co., Tenn., Oct. 17.

Preparing for Winter—Report.

I am packing my bees for winter. I take the slats out of one super, leaving the lower super with the section slats in; put in the canvas mat or thin boards over the section slats, then fill the two supers with dry leaves. I have always wintered my bees on the summer stands, and my loss has never exceeded 5 percent. My crop this year has been fair, about 3,200 pounds from 62 colonies, spring count. I doubled back all my after July swarms, which leaves all colonies strong, and hives full of winter stores. J. Q. SMITH, Logan Co., Ill., Oct. 23.

Short Honey Crop.

The honey crop is short in this locality; in fact, if it had not been for sweet clover the bees could not have lived thru the summer, but by its help we got a small surplus, say 10 pounds per colony. O. H. LASH, Allen Co., Kans., Oct. 16.

Last Winter a Severe One.

I find that all small bee-keepers were wiped out of existence during the long and extremely cold weather we had last winter. In fact, I saw only one man at our fair who said he saved any of his bees. I exhibited three colonies of bees in observatory hives, and I believe I am safe in saying that hundreds of people askt me if I had any bees to sell. It seemed that nearly every one who had lost his bees was not discouraged, but wanted to begin again. It seemed to be the universal answer to a question of mine that I would put to a stranger who would come along and look at my bees, "Have you bees at home?" "No; I did have until they died last winter."

"Are those bees for sale, or will you sell me a colony or two to commence with again?"

There are no large bee-keepers in this vicinity; in fact, I am the largest, I think, in our county, having a little over 100 colonies. CHAUNCEY REYNOLDS, Saudusky Co., Ohio, Oct. 16.

Bee-Keeping in Minnesota.

The fatality among the bees in this part of the country last winter almost discouraged most of those engaged in the business. Some lost all of their bees, while some were more fortunate, yet fully 50 percent died last winter and during the spring.

I put 29 colonies into winter quarters, and had 34 to start with in the spring. I have just doubled my number of colonies, and have taken over 3,000 pounds of comb honey, and my bees are seemingly in good condition for winter.

Now, I would like some one to explain the reason why so many lost their bees—

HOW MANY EGGS

do you get? No matter, you will get twice as many if you feed the hens **Green Cut Bone**. It doubles the egg product in every instance. It makes hens lay in cold weather when eggs are worth the most money. It makes early and long layers of the pullets.

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife. We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal, with \$3.00, and we will also send to each new name a copy of the Premium Edition of the book, **BEES AND HONEY**. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

DOUBLE THE FOOD VALUE

can be secured from grain fed to live stock if it is cooked. It is more easily digested and assimilated by the animal stomach.

ELECTRIC FEED COOKERS

These cook feed in the quickest and best way and with the least amount of fuel. Made of cast iron, lined with steel. Boilers made of heavy galvanized steel, made in 12 sizes. 23 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 23 cents a pound—CASH—for best yellow, upon its receipt. Now, if you want the money PROMPTLY, send us your beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

men that were considered good bee-men, and had made a success of bee-keeping for years, and last winter lost all of their bees, while men that were not considered any better had fairly good luck. One thing I noticed was, that most of those that lost most of their bees, what they had left were very weak, and stored but little honey, and the swarms that they cast were mostly small, which went to show that what were left were very weak.

As to the price of honey, I would say that I am selling for 12 1/2 cents per section, seven to the foot, regardless of color. I have no dark buckwheat honey, and I find more people prefer the amber honey than the white, therefore I sell all for the same price, and I see no reason why amber honey is not worth as much as white. I see no reason to say that white is better than amber, or that amber is better than white, as it is a matter of taste. Some prefer a sweet apple, while others prefer a sour one. I see that white honey is quoted higher than dark, yet I find just as many prefer the dark.

The Southern Minnesota Bee-Keepers' Association will meet in Winona the first Tuesday after the third Saturday in January, 1900. All interested are invited to attend. There will be notice of the program in due time.

E. B. HUFFMAN, Pres.

Winona Co., Minn., Oct. 23.

Results of the Past Season.

In the fall of 1898 I had 28 colonies of bees, all in fair condition, but not equally well supplied with honey. On Dec. 26 I put them into the cellar, but they became restless in about a month, so I took them out and placed them on the summer stands Feb. 20, 1899, the first day warm enough for bees to fly. However, it turned cold again, and remained so for a long time, so that when spring fairly opened, they had dwindled down to 15 colonies, but they did well until fruit-trees were done blooming. All the clover was winter killed, and not much basswood around here, so they were idle all summer, and I did not get an ounce of white honey; but about the middle of August they waked up, and made up for the lost time, the honey-flow lasting until about the middle of September.

I got 1,236 pounds of extracted, and about 30 pounds of comb honey, and increase them to 25 colonies, mostly by dividing, and they are now all in fine condition, and well supplied with honey.

FRED BECHLY,

Poweshiek Co., Iowa, Oct. 22.

Convention Notices.

Minnesota. — The Minnesota Bee-Keepers' Association will hold its 11th annual meeting at the Court House in Minneapolis, Wednesday and Thursday, Nov. 8 and 9, 1899.

J. P. WEST, Pres., Hastings, Minn.

DR. L. D. LEONARD, Sec., Minneapolis.

Colorado. — That "irrepressible" Colorado State Bee-Keepers' Association will hold their annual convention Nov. 27, 28 and 29, in the State House, Denver, beginning at 10 a.m. As usual, the State Agricultural College will assist us. Every one should come loaded with ideas and subjects for discussion; those who cannot come should write soon to the secretary or the president and tell us what are the particular needs of your locality. The members will be the program—we know from experience that you will make a very lively convention. Come everybody—there is sure to be "a hot time in the old town."

R. C. AIKIN, Pres.,

F. RAUCHFUSS, Sec., Loveland, Colo.

Box 378, Denver, Colo.

A Great Seed Farm. One of the most interesting sights the writer saw last summer was the great Buckbee Seed Farm at Rockford, Ill. A visit to these farms and an insight into the methods employed to produce perfect seeds, give one a ready understanding of why the Buckbee business has grown to such great proportions. In the first place the greatest care is exercised in growing the seeds, everything possible being done to insure seeds possessing vigor and vitality. The seeds are grown under Mr. Buckbee's supervision on farms located at the extremes of the country from Michigan to California, at whatever point experience has shown that the best seed of that particular kind can be produced. At the trial farms at Rockford these seeds are carefully tested—first by a germination test which must develop at least 92 percent of the seed or they are discarded as not up to the Buckbee standard. After this they are given a practical field test. The writer saw 1,500 plots of ground upon which experiments were being made. No new variety is ever advertised or sold by the Buckbees until after it has been tested three years. It is in this way, by being absolutely certain that everything which leaves the seed-house is exactly as represented, that the immense trade of the Buckbee firm has been built up. It is a striking object lesson in business honor. As bee-keepers are users of seeds of various kinds, this paragraph will be of interest. Always mention the American Bee Journal when writing to advertisers.

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscribers. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co., 118 Mich. St., Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant. This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth, the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 100 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb of extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kolnke.—Origin, Development and Cure. Price, 10 cents.

Cappings and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field. Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 18.—The market is active and full quotations are obtained. A little fancy white sold at 16c, but sales are chiefly at 15c for the best grade; white, not strictly fancy, brings 13, 14 and 15c; amber grades range from 10c to 12c, and dark, 9c to 10c. Extracted, 7c to 8c for white, according to body, flavor and package; amber, 7c to 7½c; dark grades, 6c to 7c. Beeswax, 26c to 27c. R. A. BURNETT & CO.

KANSAS CITY, Oct. 19. The demand for comb honey is fair, and supply light. The supply of extracted is light, and demand good. We quote No. 1 white comb, 13½ to 14c; No. 2, 13 to 13½c; No. 1 amber, 13½c; No. 2, 12½ to 13c. Extracted, white, 7 to 7½c; amber, 6 to 6½c; dark, 5 to 5½c. Beeswax, 22 to 25c. C. C. CLEMONS & CO.

NEW YORK, Oct. 20. Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13 to 14c; amber, 11 to 12c; and buckwheat, 9 to 11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c per gallon. Beeswax quiet at 26 to 27c. HILDRETH & SEGELKEN.

CINCINNATI, Oct. 9.—The demand for honey, both comb and extracted, is very good, with prices much better than a few weeks ago.

Fancy comb finds ready sale at 15 to 16c; darker grades are hard to sell at any price.

Good demand for all grades of extracted. White clover and basswood brings 8 to 8½c; amber and Southern at from 6 to 7c. Good demand for beeswax at 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth.

We do not handle honey on commission—we buy for spot cash only.

BUFFALO, Oct. 20. Supplies of strictly fancy 1-pound combs are lightest for many seasons; such are held firmly at 14c; few sales, 15c; No. 2, from 12c down. We do not notice any extraction in market. It is wanted at from 5c to 7c per pound. Beeswax, from 26 to 30c per pound for fancy pure yellow. BATTERSON & CO.

ALBANY, Sept. 26. We quote: Fancy white comb, 15c; No. 1 white, 13 to 14c; mixt, 11 to 13c; buckwheat, 10 to 11c. Extracted, white, 8 to 9c; mixt, 6 to 7c; dark, 6. MACDOUGAL & CO.

Successors to Chas. McCalloch & Co.

BOSTON, Oct. 13.—We quote: Fancy No. 1 white in cartons, 15 to 16c; A No. 1, 14 to 15c; No. 1, 13 to 14c. Extracted, light amber, 7 to 8c; amber, 6 to 7½c.

But little new to note in this market on honey. The supply still continues to be very short while the demand is naturally a little lighter, as the retail trade is not quite up to higher prices, still with the light stock they must evidently come to it. BLAKE, SCOTT & LEE.

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14 to 14½c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 9c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15 to 16c; No. 1, white, 14 to 15c; dark grades, 10 to 12c. Demand good and supply light. No extracted in market. White would sell for 8 to 8½c. Beeswax, 23 to 24c. M. H. HUNT & SON.

CLEVELAND, Oct. 18. Fancy white, 16c; No. 1 white, 15c; fancy amber, 12 to 13c; No. 1 amber, 11 to 12c; fancy dark, 9 to 10c; White extracted, 8 to 8½c; amber, 7 to 7½c. A. B. WILLIAMS & CO.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

(Continued from page 692.)

The secretary then read Mr. Newman's paper, entitled,

Organization Among Bee-Keepers—If Desirable, Why, and How Best Accomplish.

This theme was assigned to me by your secretary, and I will briefly give my views upon it.

Is organization desirable? Most assuredly. For the past 20 years I have advocated it, and in 1877 I address this association at some length on the subject, presenting a constitution and by-laws which were adopted, but, unfortunately, on account of general apathy they were never put into practical operation.

BENEFITS OF ORGANIZATION.

Our National government—a union of States—suggests the benefits to accrue from a perfect organization. If dismembered, the individual States, acting independently, might clash and antagonize, but, when united, the result is strength, stability and harmonious action, compelling respect and securing to all the enjoyment of their rights and privileges. So with apiarists, their only chance for success, strength and permanence lies in organized efforts, unity of purpose, and concert of action.

Each bee-keeper worthy of the name should unite with a county or district association; this should affiliate with a State organization, and that in turn should be represented in a national association. If we had this kind of organization we could ascertain the yield, and control the honey market, set a uniform price for the crop, and have the pro-

duct distributed judiciously all over the country. Such a society would be a reliable barometer of the market, and the safe-guard of the pursuit. It could grade the product, guarantee the purity of the out-put, and destroy the nefarious business of adulteration. A central honey-depot could be maintained in the metropolitan cities, to which producers could ship with safety, and receive prompt returns—to the annihilation of fraudulent commission houses.

WHY ORGANIZE?

Because the secret of success is to *manage* the honey market. This is far more important than to successfully manage the apiaries, much as that is to be desired. To sell the product—to secure the highest cash price, and to be sure of the proceeds of the crop when sold—these are essential, and tower above all other considerations. They are in fact "the key to success!"

Perfect organization will accomplish this when nothing else will. Neither honey nor any other product will sell itself, but unity of action, brains and push, will do it.

HOW TO ACCOMPLISH IT.

The first successful attempt to organize for protection was the formation of the National Bee-Keepers' Union, which has given the pursuit a standing in court, and now, after 15 years of existence, compels the respect even of the enemies of the pursuit; and defends bee-keepers in their rights—for "unity is strength."

Since that your society has resolved itself into a similar organization, and as it seems unwise to perpetuate two of

No. 1.—Mr. J. Q. Smith and the North Half of the Exhibit (Comb and Extracted Honey) of J. Q. Smith & Son, at the Illinois State Fair, at Springfield, Sept. 25 to 30, 1899.—See page 648.

such, it has been proposed to amalgamate them into one. This is no doubt desirable, and I hope that it may be accomplished, for one strong and united society is more potent than a dozen weak ones. If all are disposed to be fair and just, and treat the members of both organizations with due consideration, I think the time has arrived when the "marriage" may be consummated, and arrangements for the "wedding feast" may safely be made. The "wooing" may have been somewhat discouraging at times, but that is not unusual. The courageous "suitor" often wins the bride after many a repulse and several lovers' quarrels, and this case may be no exception.

As the presidents of both societies are to be present at your meeting, they might agree upon the details for "the marriage settlement," by selecting one of the constitutions and by-laws, including a name for the amalgamated organization, or arrange something entirely new, including a nomination for officers—then upon both societies adopting such and electing the same officers, the uniting will have been accomplished without friction, and the new organization be ready to begin the new century, and soon become a powerful factor in promoting the interests of apiarists in America.

PERSONAL.

As you are all aware, I have devoted many years of my time and energies to the interests of the pursuit of apiculture. What has been accomplished is a matter of record. All apicultural societies are alike near to my heart, and have my best wishes for permanent success. Now, on account of declining years, many business cares, and prolonged indisposition, I desire to retire from active service, hoping to have earned the respect and confidence of every apiarist. If the snows of many winters have whitened my brow, a blooming rose is at my heart, and an olive-branch in my hand.

Yours fraternally,
San Francisco, Calif. THOMAS G. NEWMAN.

Mr. Selser I think the most practical discussion on this subject is to get the *modus operandi*.

Dr. Mason—Having been intimately connected with the organization of the National Bee-Keepers' Union and of the United States Bee-Keepers' Association, and knowing all the hard things that have appeared in the bee-papers about the amalgamation of the two organizations, I am glad that the union of the two seems ready for accomplishment.

Some, if not all of you, as well as the members of both organizations who are not here, may be glad to know what has been done towards bringing about this result, so I will, in as brief a manner as possible, explain it. Some of you know that at the meeting of the North American Bee-Keepers' Society in Toronto, Canada, in 1895, measures were adopted with a view to the amalgamation of that society and the National Bee-Keepers' Union. A committee of seven, with Thomas G. Newman as chairman, was appointed to mature some plan for such amalgamation and present it at the next meeting of the society. The committee failed to agree upon a plan, but a plan was prepared and adopted at the meeting at Omaha, tho the National Bee-Keepers' Union refused to adopt it. Since then repeated efforts have been made to secure the union of the two organizations, but without success.

In March last, in writing Mr. Thomas G. Newman, General Manager of the National Bee-Keepers' Union, in regard to preparing a paper for this convention, I suggested the desirability of the union of the two organizations, and that if he agreed with me as to its desirability, it would be a nice thing for him and myself, as we had been leaders in their organization, if we could evolve some plan for their union and present it to this convention as a surprise, and recommend its adoption by both organizations.

In Mr. Newman's reply, of March 14, he wrote me in part as follows:

I am willing to do all my strength will allow for the pursuit. I am not now desirous of fame or honor, have had both to my heart's content, as you are aware. I am greatly interested in a thoro organization for bee-keepers. That has been my aim for many years. I hope it may be accomplished, even if I do not witness it. The National Bee-Keepers' Union was an effort in that direction, and it has for 15 years been a power for good—an apicultural rock of defense.

And then again on April 1 he wrote:

Your cordial letter of March 22 came several days ago, and would have been answered sooner, but I was unable to do so.

Your explanation of the condition of things is quite satisfactory, and I heartily wish that I could be present at the Philadelphia convention. I know that I would enjoy it very much, for notwithstanding the many harsh words that have cropped out during the past few years, I know that great cordiality exists among bee-keepers, and that they appreciate the work done for the pursuit by the National Bee-Keepers' Union. You

are well aware that during the past 15 or 20 years I have often brought this matter of organization among bee-keepers up before the conventions, and advocated a thoro, representative organization, but the great distances in our country, and the many drawbacks, have prevented its accomplishment. Now we must take another tack and present it in another way, to accomplish this purpose. I will endeavor to outline that way in my paper, and will give you my best thoughts on the subject. "Let bygones be bygones." We must grapple with the PULSATING THOUGHT of the PRESENT AGE.

I wish you would kindly forward me a copy of your constitution and by-laws as amended at your last meeting, so that I may carefully examine the same, and if I find any desirable change can be made I will mention the matter, so that it may be acted upon at the Philadelphia convention. As you suggest, I will give my views to the convention on amalgamation.

And again on April 13 Mr. Newman wrote:

Your letter of April 6 came duly, and its contents are noted. I appreciate most fully its cordiality and general tone, and am glad to be able to reciprocate the many expressions of affectionate remembrances when we have worked together during the many years of the past.

I accept the amendment of my subject, making it now "Organization Among Bee-Keepers. If Desirable, Why and How Best Accomplished," and as soon as I can find time, and have sufficient energy to put into it, I will give the matter thoro study. Meanwhile, I am very glad to accept your kind offer for "maturing" the plan for amalgamation, and to have everything arranged in advance for the convention to act upon.

I think that the constitution of the "United States' Association contains all the essential features of the "National" with some improvements, and if you find it equal to the necessities of the case, let IT BE ADOPTED. If you find any amendments desirable, let it be amended accordingly. All I would ask is the adoption of the name, "National Bee-Keepers' Union," and would not ask that did I not think it DESIRABLE as well as ESSENTIAL to success. Let the united wisdom of those present determine everything else. We cannot afford to LOSE the prestige of the "National" carried with its name.

As to officers, EFFICIENT ONES who will WORK are the only ones worthy of the honors. Let such be chosen for the amalgamated organization, and I will then arrange all the officers there selected as "a ticket" to be voted upon at our annual election, and will ADVISE our members to vote it as a whole.

As I will not be able to be present at the convention in body, you may count on my being there in spirit. You are right in saying that IT TAKES TIME to mature any good plan, and as there are several months to intervene, there will of course be time to do it right, and I know that you will exercise GREAT SKILL in the matter. You may count on my hearty co-operation and assistance at all times.

Again on Aug. 21 he wrote as follows:

Your letter with copy of the program came to hand this morning, just as I was about to mail to you my paper for the convention, which I now enclose in this letter. The subject is a very important one, but I have given only a few hints concerning the lines to be pursued to achieve success, leaving it for the master minds who will be present at the convention to fill in the details, and thus put flesh upon the skeleton that I present.

I should like to be present and assist in arranging the details, but as that is impossible I must be content. If all will work together for the common good, and are willing to sacrifice some of their own feelings or prejudices, considerable good will result. If there is a disposition to be fair and reasonable you may depend upon my working in harmony with you and others to bring about the desired results.

While I am sorry that you did not have time to prepare the constitution, etc., still I have the utmost confidence in your ability to make the same as nearly right as possible. I have no axe to grind. I ask neither dictum nor position, all I want is the "greatest good to the greatest number." I have had honors innumerable, and words of praise for the work accomplished from all over the country concerning my management of the National Bee-Keepers' Union for the past 15 years, and it is pleasant to have my work appreciated, but that was not the object before me as an incentive in attaining such great results.

The constitution and by-laws, which you will prepare, I know in advance, will receive my entire approbation, and, if I were present we would work together to bring about something that would make the bee-keepers of America proud.

I hope that you may have a very pleasant convention. Please remember me to all old friends.

As Mr. Newman had in substance said that he would be satisfied with what I might prepare to present to this convention, and, being very busy, I had neglected to prepare anything, but immediately on receipt of the above letter on the 25th, I set to work to prepare such amendments to our present constitution as seemed desirable and necessary for the union of the National Bee-Keepers' Union and the United States Bee-Keepers' Association, so as to send them to Mr. Newman and get his criticisms and suggestions in time for this convention, asking him to direct his reply to me here. His reply was handed me here during our last evening's session, and is as follows:

MY DEAR DR. MASON:—Yours of the 26th, from Toledo, is just received, and I reply immediately so that you may get it at the convention.

I have read the amended constitution carefully, and heartily approve every part of it. The two blanks that you have left would be very properly filled, as you have penciled, for the directors should be nine. The term of office would be better for three years than one, and to have an election each year to give the membership a chance to vote for one-third of them would be advisable, I think.

As to the "declining" of one to make the nine, I hope you will allow ME to DECLINE a position on the board of directors; not that I would desire to shirk any duty, but I have too much to do for my physical strength. I shall be pleased at any time to render advice, or do anything in my power to assist in the management. As I have had 15 years' experience, something may come up upon which I could give valuable information or advice. This plan would leave out every possible cause for friction, for there are some, of course, who do not like me, for I have "convictions," and will STATE them, and you know that a man who has no enemies is not of much force or good in this pushing world. I shall be well satisfied in any event, and will help to bring the consolidation to a successful issue by every means in my power.

One other thing I might mention. I see that you have adopted the name "National Bee-Keepers' Union;" of course, because of the history and achievement of the old Union, but I never liked the word "UNION." It has been abused so much all over the country by being attached to lawlessness and intrigue, so that it the majority of those present at the Philadelphia convention should prefer the word Association, it will receive my hearty approval.

One more point. I see you have attached to this constitution our names. I prefer to have yours first, as it should be, as you are there present to present it. It is your work, and you are entitled to the credit. I simply heartily approve of the work you have done, joining with you in presenting it, therefore please transpose the names.

Now, with the heartiest wishes for concord and earnest and active work, with the blessings of united and harmonious labors, and with kindest regards to all who are present, to deliberate upon the best means of accomplishing the work before the convention, I remain,

Fraternally yours,
THOMAS G. NEWMAN.

Altho I believe Mr. Newman meant just what he said, whatever we do here "will receive my entire approbation," still this last letter was a thoro surprise to me.

I at first suggested to Mr. Newman the name of the new organization be "The National Bee-Keepers' Union," because we could not afford to lose the influence that name carries with it. I also corresponded with the leading officers of both organizations, and two others of our leaders regarding the name. All except Mr. Newman and one other that I corresponded with are here to-day, and all except two were in favor of the old name. One of the two didn't care what was done, and the other didn't like the word "Union," preferring "Association" instead. For my own part, I prefer the name "Association" to that of "Union" for the reasons given by Mr. Newman, and now that he, as the representative of the "Union," has said that "if the majority of those present at the Philadelphia convention should prefer the word Association, it will receive my hearty approval," it seems that all points of disagreement are settled, and nothing remains to be done but for the members of both organizations to express their approval of what has been done and of the proposed constitution, which, in behalf of Mr. Newman and for myself, I now propose as follows:

The Amended Constitution.

ARTICLE I.—NAME.

This organization shall be known as the National Bee-Keepers' Association.

ARTICLE II.—OBJECTS.

Its objects shall be to promote the interests of bee-keepers; to protect and defend its members in their lawful rights; and to enforce laws against the adulteration of honey.

ARTICLE III.—MEMBERSHIP.

SEC. 1.—Any person who is in accord with the purpose and aim of this Association may become a member by the payment of one dollar annually to the General Manager or Secretary; and said membership shall expire at the end of one year from the time of said payment, except as provided in Section 10 of Article V of this Constitution. Any person may become an honorary member by a two-thirds vote of all the members present at any annual meeting of this Association.

SEC. 2.—Whenever a local bee-keepers' association shall decide to unite with this association as a body, it will be received upon payment by the local secretary of 50 cents per member per annum, providing that the local association's membership dues are at least \$1.00.

ARTICLE IV.—OFFICERS.

SEC. 1.—The officers of this Association shall be a President, a Vice-President, a Secretary, and a Board of

No. 2. South Half of the Exhibit (Extracted Honey and Beeswax) of J. O. Smith & Son, at the Illinois State Fair, at Springfield, Sept. 25 to 30, 1899. See page 618.

Directors, which shall consist of a General Manager and 12 Directors, whose term of office shall be for four years, or until their successors are elected and qualified, except as provided in Sec. 2 of this Article.

SEC. 2. E. Whitecomb, W. Z. Hutchinson and A. I. Root shall be directors until Jan. 1, 1901; J. M. Hambaugh, Dr. C. C. Miller and C. P. Dadant shall be directors until Jan. 1, 1902; Thomas G. Newman, G. M. Doolittle and W. F. Marks shall be directors until Jan. 1, 1903; and E. R. Root, P. H. Elwood and E. T. Abbott shall be directors until Jan. 1, 1904. Hon. Eugene Secor shall be General Manager until Jan. 1, 1901.

SEC. 3. The President, Vice-President and Secretary shall be elected annually by ballot by a majority vote of the members present at the annual meeting of the Association.

SEC. 4. The President, Vice-President and Secretary shall assume office on the first day of January succeeding their election, and shall constitute the Executive Committee.

SEC. 5. The General Manager and the Board of Directors to succeed those whose term of office expires each year, shall be elected by ballot during the month of December of each year by a majority vote of the members voting; and the Board of Directors shall prescribe how all votes of the members shall be taken.

ARTICLE V.—DUTIES OF OFFICERS.

SEC. 1. President It shall be the duty of the President to preside at the annual meeting of the Association, and to perform such other duties as may devolve upon the presiding officer.

SEC. 2. Vice-President In the absence of the President the Vice-President shall perform the duties of President.

SEC. 3. Secretary It shall be the duty of the Secretary to keep a record of the proceedings of the annual meeting; to receive membership fees; to furnish the General Manager with the names and post-office addresses of those who become members, whenever requested of him; to make a report at the annual meeting of the Association, and, whenever requested to do so by the Board of Directors, of all moneys received and paid out by him since the last annual meeting; to pay to the Treasurer of the Association all moneys left in his hands after paying the expenses of the annual meeting; and to perform such other duties as may be required of him by the Association; and he shall receive such sum for his services as may be granted by the Board of Directors.

SEC. 4. General Manager The General Manager shall

be Secretary of the Board of Directors and Treasurer of this Association; he shall receive membership fees, giving a receipt therefor; he shall keep a list of the names of members with their post-office addresses; he shall notify each member of the time of the expiration of his membership at least 30 days before said membership expires, and ask for a renewal of said membership.

SEC. 5.—Whenever one or more amendments of this Constitution have been proposed as provided in Article IX, it shall be the duty of the General Manager to submit the proposed amendment or amendments to a vote of the members at the time of the next annual election of officers for adoption or rejection.

SEC. 6.—At the time of sending the ballots to the members for the annual election, the General Manager shall also send to each member a list of the names of all members, and an itemized statement of all receipts and expenditures of the funds of the Association by the Board of Directors, and a report of the work done by said Board of Directors.

SEC. 7.—The General Manager shall give a bond in such amount, and with such conditions as may be required and approved by the Board of Directors, for the faithful performance of his duties, and perform such other services as may be required of him by the Board of Directors or by this Constitution.

SEC. 8.—The Board of Directors shall pay the General Manager such sum for his services as said Board may deem proper, but not to exceed 20 percent of the receipts of the Association.

SEC. 9.—The said Board shall choose its own chairman, and shall meet at such time and place as it may decide upon, and shall determine what course shall be taken by the Association upon any matter presented to it for consideration, that does not conflict with this Constitution; and cause such extra but equal assessments to be made on each member as may become necessary, giving the reason to each member why such assessment is required; provided that not more than one assessment shall be made in any one year, and not to an amount exceeding the annual membership fee, without a majority vote of all the members of the Association.

SEC. 10.—Any member refusing or neglecting to pay said assessment as required by the Board of Directors shall forfeit his membership, and his right to become a member of the Association for one year after said assessment becomes due.

ARTICLE VI.—FUNDS.

The funds of this Association may be used for any purpose that the Board of Directors may consider for the interest of its members, and for the advancement of the pursuit of bee-culture.

ARTICLE VII.—VACANCIES.

Any vacancy occurring in the Board of Directors may be filled by the Executive Committee; and any vacancy occurring in the Executive Committee shall be filled by the Board of Directors.

ARTICLE VIII.—MEETINGS.

This Association shall hold annual meetings at such time and place as shall be agreed upon by the Executive Committee, who shall give at least 60 days' notice in the bee-periodicals of the time and place of meeting.

ARTICLE IX.—AMENDMENTS.

This Constitution may be amended by a majority vote of all the members, provided notice of said amendment has been given at a previous meeting.

ARTICLE X.

SEC. 1.—The above proposed amendments to the Constitution of the National Bee-Keepers' Association are made with the expectation that they will be adopted by the members of both organizations for the purpose of uniting them into one, but should the members of the National Bee-Keepers' Union reject the above proposed Constitution, then the vote of the members of the United States Bee-Keepers' Association shall be null and void.

SEC. 2.—Should this proposed Constitution be adopted by the above-named organizations, such disposition shall be made of the moneys and other properties of the two organizations as shall be agreed upon by the Advisory Board of the National Bee-Keepers' Union and the Board of Directors of the United States Bee-Keepers' Association.

SEC. 3.—All those who are members of the National Bee-Keepers' Union, and those who are members of the United States Bee-Keepers' Association at the time this

Constitution is adopted, shall be members of this Association until such time as said membership will cease in the Union or Association to which they belong at the time of the adoption of this Constitution.

Proposed by THOMAS G. NEWMAN,
A. B. MASON.

Mr. Root—Can we not discuss each section as we go thru?

Mr. Doolittle—I don't see why this Constitution as read is not good enough with the exception of changing the name Union to Association.

Mr. Abbott—One of the things seems to be that the National Union is swallowing up the Association. I made up my mind when the first sentence was read that I would stand here until Gabriel's trumpet sounds to fight for the Association. But it seems to me that the friends can see neither is being swallowed up.

Dr. Mason—It seems to me that there is no swallowing up.

Mr. Wander—Why do they want the voting on our side first?

Dr. Mason—Both societies vote in December.

Mr. York—This Constitution is not for us to adopt now, but simply to consider and recommend for adoption.

Dr. Miller—Let us have clear and full knowledge of the meaning of the matter before us. We need to have full information.

Dr. Mason—No one can tell you what it will mean. The future will tell that.

Mr. Stone—I do not clearly understand. Suppose we vote this, we have elected our officers.

Dr. Mason—The directors are named here. Provision is made for putting all the members of both old boards on the new board, and also adding W. F. Marks and P. H. Elwood, of New York, as new members.

Mr. Root—Even if we were not marrying these associations, it seems to me that the Board of Directors, which consisted of six, was a little too small. This proposition provides for 12 directors.

Mr. Selser—As I understand it, *our* members vote in December. If *we* cannot vote upon it now, why bother with it?

Dr. Mason—Our Constitution requires that notice of any proposed amendment shall be given at an annual meeting before it can be voted on by the members of this Association, and the object in discussing the matter here is, so that if we see fit, we may recommend the adoption of the amendments by the members; just giving the matter our endorsement.

Mr. Doolittle—There has been some friction, and I think if this goes to the Pacific Coast that we are united, it will help us.

On motion it was voted that this convention recommend the adoption of the proposed amended Constitution.

W. L. Coggsball, of Tompkins Co., N. Y., on being asked his opinion on a certain subject, said he could "operate bees better than talk."

Thad. H. Stevens—How many colonies have you, Mr. Coggsball?

Mr. Coggsball—1,300.

Mr. Keeler—What kind of bees have you?

Mr. Coggsball—Italians.

Mr. Keeler—Do you keep them at a distance from your dwelling-house?

Mr. Coggsball—If it is more convenient.

E. R. Root—Do they sting as they did when I was there?

Mr. Coggsball—No, the bees wanted to give you a touch of their ability in that line of business, and the boys stirred them up for your special benefit.

Mr. Howe—In extracting honey the last record we made was 1,400 pounds in 14 hours.

E. R. Root—I don't know what a record is in that line, and I want to know if any one has a better record. How do you handle the combs?

Mr. Howe—We put the combs in the extractor just as they hang in the hives, and when one side is extracted we take one comb in the left hand and one in the right and change places with them without turning them, and you can see it is very quickly done.

Dr. Mason—Who uncaps the honey?

Mr. Howe—We do the extracting before the honey is cap. By having everything convenient we can do it in a very short time.

Pres. Whitecomb—What do you do with the honey afterwards?

Mr. Howe—Sell it.

Mr. Hershiser—My opinion of extracted honey is that it is sent out in very bad shape. Sweet clover honey is very thin if extracted before it is sealed over.

Mr. Root—Mr. Coggs shall claims to have no one at his out-apiaries. How does he take care of them?

Mr. Coggs shall—Large hives are of vital importance.

Mr. Root—How do you put up your honey?

Mr. Coggs shall—In kegs. To put it in cans would take one extra hand.

O. O. Poppleton—In a warm climate, in extracting honey, we have the frames put in the extractor as they hang in the hive, instead of on the end. In Cuba we used to run two hands at \$8 a month during the time we were engaged in extracting. We have extracted as high as 2,000 pounds in one day. My tank was so arranged that we could tell just how much there was in it.

Mr. Coggs shall—One thing I want to speak of is the importance of getting the bees off the combs. We go to one end of a row of hives, raise the oilcloth, puff in a little smoke, and the bees will go down if you give the end of the oilcloth a little shake up and down for a minute or half a minute. The motion makes a suction.

F. Danzenbaker—I have noticed that when it was warm the bees would get up motion. Just give them a little smoke.

Dr. Miller—Suppose you use no oilcloth, do you think it worth while to have the cloth?

Mr. Coggs shall—Certainly.

Mr. Root—By using the suction motion the result was, most of the bees would drop.

Pres. Whitcomb—I think it is a dangerous thing to let it go out that we sell honey extracted without capping.

A sample of honey extracted before capping was shown.

Pres. Whitcomb—This is not honey—it is nectar.

Mr. Root—This honey ran 12 pounds to the gallon. Nebraska is the only State that will produce honey that weighs 13 pounds to the gallon.

Mr. Selser—Mr. President, I think the matter that you spoke of should be well aired.

Put the honey in the sun to ripen. It is a fact, and I am sorry, that honey is extracted before it is ripe. It is not honey; it is nectar. Honey, as far as weight is concerned, depends largely upon the temperature to which it has been exposed. I do not think the impression should go out that honey is not ripened. I would like to ask Mr. Best what his experience is.

Mr. Best—If honey is not well capt it will not keep in our locality, but if it is capt it will keep.

Mr. Hershiser—I think it is easy to tell if honey is fit to extract. Just turn the comb over, and if the honey falls out it is not ripe, and should not be extracted.

R. B. Chipman—I think I have handled honey as much as any one who extracts. Localities differ. Honey that has soured the quickest with me is honey that has not been capt. The only right way to handle honey is to put it in cans and never handle in any other way. Did the president test accurately the honey that weighed 13 pounds?

Pres. Whitcomb—Yes. Heart's-ease honey that was exhibited at the World's Fair has not yet granulated. I took it home in November. A man in Canada said Cuban honey should weigh 13 pounds. I take it that honey is ripe, under ordinary conditions, that weighs more than 11 pounds.

Mr. Selser—All honey is 23.5 percent water. The weight of honey depends upon the amount of water in it.

The convention then adjourned until 7:30 p.m.

[Continued next week.]

How to Prepare the Bees for Winter.

BY G. M. DOOLITTLE.

A CORRESPONDENT wants to know when it is best to prepare his bees for winter, and thinks it will be better to wait till the brood is out of the way in November, at which time he can fix them up and feed them so that they can carry the food right into the center of the brood-nest where the brood has lately hatched. I have been writing some of late on this subject, but as the questions still come in, it may be well to say a few words more along the line of getting the bees ready for winter.

To the above I would say, don't on any account wait till cold weather comes before fixing the bees for winter, for, if you do, winter will be almost sure to come and find your bees not ready for it. Years ago I used to think that the middle of November was time enough to look after the winter necessities of the bees, but when that time came something would occur so that I would think that waiting a few more days would do no harm, and so I kept putting it off and putting it off till I was caught by snow and freezing cold weather, and, as I write, I remember about writing an article telling how I had equalized the stores of certain colonies when the mercury was near zero, considering that I had accomplished quite a feat in doing it. Well, the next spring found me mourning the loss of many bees, and, upon asking, I received advice from that great writer of yore—Elisha Gallup—telling me that the months of August and September were the ones in which bees should be gotten ready for winter. After profiting by this advice for many years, I am sure he was right, and more especially so where the bees have not stores enough to carry them thru to the next honey harvest.

If there is one item above another, having great importance in the wintering problem, it is the securing of the winter stores near and about the cluster of bees in time for them to settle down into that quiescent state so conducive to good wintering, prior to the middle of October, in the more northern localities.

To arrange these stores properly and seal them requires warm weather; hence all will see the fallacy of putting off caring for them till cold weather arrives, as is the thought expressed by our correspondent.

To be sure that all have the desired amount of stores, there is only one certain way to do, and that is to open the hives and take out each frame and weigh it, after having shaken the bees off. Next weigh a frame of empty comb, or several of them, so as to know the average weight, which, when deducted from the weight of those in the hive, will give the weight of honey, note being made in all cases of the amount of pollen the combs contain, their age, etc., and the necessary allowance being made accordingly.

Not long ago I saw it advised to put into an empty hive the number of combs used in wintering, and weigh the hive so arranged, when the hives in the apiary were to be weighed, the amount of the other deducted, and if there was 20 pounds left above this deduction there would be sufficient stores in that hive for wintering on the summer stands, and if there was 15 pounds it would do very well for cellar-wintering. No one could make any mistake in calling such a method a careless procedure, and one which would tend toward making wintering a failure. Hives subject to the weather weigh more than dry hives do that are liable to be taken from the store-room; colonies of bees differ very much as to size and weight; old combs weigh double that of new ones; combs from a colony which was queenless for some time during the summer will often contain pollen to one-half of the amount allowed for cellar-wintering; hence these and other factors make that method of procedure little better than guesswork.

Again, the amount named is too little by far, were this all available stores. If after going over a hive and weighing each comb as I have given above, I find that there is 25 pounds of actual stores, I call that hive or colony all right for winter. If less, it must be fed the deficiency; if more, it can spare some to help another colony which is lacking in that amount. In this way the whole apiary should be

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

♦ ♦ ♦ ♦ ♦
The Premiums offered on page 719 are well worth working for. Look at them.

gone over, equalizing and feeding, if it is required, until all have the requisite 25 pounds.

But I hear some one say, "It would be a fearful job to shake the bees off from every comb in a colony and weigh each comb separately." Well, so it would be if done with each colony, yet I think it would pay in the long run, even then; but you will have to do this with only two or three till you get the right conception of just how much honey there is in each frame, by simply lifting it from the hive and looking at it, when you can count off the number of pounds almost to a certainty, and do it as rapidly as you can handle the frames. However, you will have to weigh a few if you have never practiced this plan, to give you the necessary training required, after which you can count off combs of honey so as to rarely vary more than a pound or two, and when the apiary is thus gone over there is a certainty about it which always gives success, besides we can say we positively *know* in this matter, which is a great satisfaction, to say the least.

But another letter before me asks for my plan of making winter food where there are not stores enough for wintering in the whole yard, after equalizing. I have given my formula several times of late, but as I have had several calls for it during the past two weeks, I will briefly give it again:

In a vessel of sufficient size put in 15 pounds of water. Set over the fire till it boils, then stir in 30 pounds of granulated sugar. Allow the whole to boil again, set from the fire and stir in 5 pounds of extracted honey. When cool enough it is ready for feeding, and gives about 50 pounds of feed, which is fully equal if not superior to the best honey.

Another writes, "Is not tartaric acid or vinegar as good for keeping the syrup from crystallizing as the honey?" My answer to this is *no*. There is nothing I ever tried which will equal honey, and I would have the honey, even if I had to send into another State for it, and pay more than it was worth in the market, at that.

But still another writes me, "I am afraid of getting foul brood with the honey." To my mind, there need be no fears on this score, for, were you to be unfortunate enough to get foul-broody honey it would not carry the disease to your bees if none of it was secured by them in any other way than in the food, for, according to all of my experience of the past, the boiling syrup will scald the honey sufficiently so as to kill all germs of foul brood, if the food is made as I have given.

I regret to know that there must be such a general wholesale feeding in many portions of our country this fall, on account of the poorness of the season of 1899.

Onondaga, Co., N. Y.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Moldy Combs in the Spring.

I have kept bees for three years and each spring my combs are very moldy and my bees weak. Two years ago, out of 7 colonies only one gave either swarms or surplus. Last winter I wintered 12 colonies with but one lost, leaving me 11, and from them I got about 25 pounds per colony, not allowing them to swarm.

In the American Bee Journal for Oct. 5, it speaks of preparing a winter-case for bees, which started me to thinking. I have several old hives and I find by knocking out the front end my hives will sit inside of these big hives with $\frac{1}{2}$ -inch space around three sides. The hives have porticos with a second story that telescopes over the main hive.

Our winters are very wet with but little sunshine. Bees winter much better in trees than in hives. How will it do if I put my hives inside and put a cushion of planer-shav-

ings over the hive in a super, and close the half-inch space with a wedge at the front to keep the wind and mice out?

We have no 30 degrees below zero to contend with, nothing but dampness, and bees generally have a good flight every three or four weeks all winter. I have now 33 colonies in good condition as far as stores are concerned. Snohomish Co., Wash.

ANSWER.—Probably the packing you speak of will be all right, but from what you say I have just a little suspicion that your bees do not have a sufficiently large entrance. With too small an entrance in a damp climate, you will be sure of moldy combs and more than the proper amount of dead bees. The trouble becomes aggravated in the course of the winter by the clogging of the entrance with dead bees. Let the full entrance be given as in summer, and see that the dead bees are cleaned from it every few weeks.

Hive-Ventilation in the Cellar.

My hive-bottoms are nailed on solid, and cellar is damp, and in winter stands only a few degrees above freezing. Do you think it would be best to raise the hive-covers? I did so last winter, and now I read that if the bees are cold they will use more honey, and my bees have gathered but little this season and will need all they have to tide them over until honey comes next year. MINNESOTA.

ANSWER.—Whether the hive-covers should be sealed down tight or not in the cellar depends upon how much ventilation there is below. The bees must have air somewhere. They may be sealed up tight at the bottom if there is enough ventilation at the top, and vice versa. If the hive is open below to the extent of having an entrance of 12 square inches, or anywhere from that to being entirely open on all four sides below, there need be no ventilation at the top. If the entrance be only equivalent to six square inches or less, and especially if part of this entrance be clogged with dead bees, then it is better there be some ventilation above. But much less ventilation is needed where it is given both above and below. An eighth-inch crack at the top will be enough.

Management of Swarms.

1. I want to get about 25 colonies of bees next year, and can get them only by catching the swarms. One bee-keeper here keeps about 45 colonies, and I will get all the swarms he will have. But I want to get all the surplus I can the same year, so I will put two or three swarms together, that is, put an after-swarm with the first or prime swarm, but I don't know what to do with the queens, which one to leave in the hive, the one in the prime swarm, or the one in the after-swarm. If it is best to leave the one in the prime swarm, how can I get the one in the after-swarm the easiest way?

2. Will not the bees swarm out if the laying queen stays in the hive, when the hive is so filled with bees?

3. Can I unite the after-swarm with the first swarm right after issuing, or will it be better to wait a few hours?

4. How much room at a time should I give to each of the colonies consisting of two or three swarms? Will a 2-story 8-frame dovetail hive do? That is, one story and two supers.

5. About what might be the average number of swarms per day from 45 colonies? Rice Co., Minn.

ANSWERS.—1. Your intention being to unite two or more swarms in one hive so as to have a very strong colony, probably your best plan will be to unite two prime swarms that come out within a few days of each other, and unite two or more second swarms issuing near together. Let the bees settle which queen they will retain.

2. There will be a chance that a swarm may be thrown off, but not much more of a chance than with a single strong swarm.

3. As already mentioned, it will be better not to unite the second swarm with its prime swarm, for the two will be a week to 10 days apart, but unite two prime swarms that come nearer together, and two or more after-swarms that come near together.

4. An 8-frame hive with two supers will be enough for a large colony, but if these are crowded with bees and they seem to need more room, by all means give it.

5. The number of swarms issuing from 45 colonies will vary greatly, according to season, size of hives, and character of bees. In a very poor season, not a single swarm

may issue, no matter what the size of hive. With large hives such as the Dadants use they do not have more than two colonies out of 45 to swarm in a whole season. With bees inclined to swarm, kept in 8-frame hives, with the right kind of a season, there may be from one to ten swarms a day thru a period of two to six weeks.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

TIME BETWEEN THE PRIME AND THE SECOND SWARM.

On page 618 we have Critic Taylor's record of *ten* second swarms, the day-intervals after the prime being 5, 7, 7, 8, 8, 9, 9, 9, 9, 10. Beats me one day in having a five-day interval; but I beat him "all hollow" in the other direction. He must remember that one year's records (or even a few years' records) are quite insufficient. In this respect one year differs greatly from another even in the same yard. Presumably localities and strains of bees differ widely also—must do so if the eight-day period some writers cling to (a little bit fanatically it seems to me) is even tolerably correct. With me more swarms issue at 13-days' interval than at 8—that is, they did up to my last counting-spot six years ago. At that time I went laboriously over the whole of my past records and found 299 recorded intervals. And this is the way they show up:

| | | | |
|-----------------|----|-----------------|----|
| At 6 days | 3 | At 12 days..... | 39 |
| At 7 days..... | 6 | At 13 days..... | 34 |
| At 8 days..... | 32 | At 14 days..... | 24 |
| At 9 days..... | 48 | At 15 days..... | 6 |
| At 10 days..... | 46 | At 16 days..... | 9 |
| At 11 days..... | 48 | At 17 days..... | 4 |

Generally speaking, the more reluctant bees are to swarm, the shorter the interval will be; and the worse the swarm-fever rages—that is to say, the *less preparation* there is at the first swarming—the longer it will be before they *can* swarm again. If they swarm without any preparation at all, and then hold the young queens prisoners in the cells a day or two, we get a 17-day period, as above.

THE ONCE-FOR-ALL MANIPULATION.

Comrade France's once-for-all spring manipulation is quite a variation from the once-a-week-and-oft-between-times method that is more frequently recommended—and both vary some from the whenever-you-feel-like-it method of the bee-feverish beginner. Page 609.

THE BEE-GRAPE QUESTION.

Anent the bee-grape question, ably handled by C. P. Dadant, page 609, I would suggest that *denying too much* often has the effect to confirm our grape-raising friends in their opinion that all our talk is special pleading and nonsense. Let us be careful about that. It is beyond denial that when a man not inured to stings wants to pick grapes it is a miserable nuisance to have the bunches covered with bees. A few kindly expressions of regret will go farther than a ton of argument just then. What does he care—the man with one eye closed, and hands swollen too stiff for service—whether (theoretically) bees can puncture grapes or not? We'll only set him to breaking commandments by the evasion of non-evadable facts. The proofs we have to offer have their application, yet they really don't cover the whole ground more's the pity. We cannot answer him when he sings—

O thou beautiful, dutiful, honeyful bee!
That you don't puncture grapes I may yet have to see;
But I'll show any court in this "bloomin' councree,"
That you puncture me.

THAT BEAUTIFUL APIARY.

A beautiful picture and beautiful apiary is that shown on the first page of Oct. 5—honey record beautiful, too. We say at once, How beautiful is art, How beautiful is nature,

How beautiful is solitude! Kind o' startles us to be told we are looking at a spot inside city limits. You're one of "dose happy bee-mans," Mr. Herman. All the ground is covered thick with tan-bark. Splendid—except that I should fear that in some desperate drouth a lurking spark from the smoker might send the whole thing up in a blaze. Or is spent tan, on the ground, always fire-proof? A little ashamed to confess that I don't know. I do know that I hate weeds, and don't like grass much better—neither do I love the amount of hoeing that I have to do in my apiary.

BEE-ZINC "MAKING" HONEY.

Doolittle, on page 626, evidently doesn't think much of excluders that only go part way. Hits me. All my extracting-supers have more than half the bottom covered with plain tin. I do not *think* that I lose materially by it; but I am hardly prepared to prove it. He is probably right about the case in hand, which had the center closed. I have a strip of perforated metal clear across the center, and plain tin strips on the two sides. Doolittle is right, also, in sailing in some more into the stubborn nonsense that bees want a path direct from the flower to the surplus cells. It is nearer the truth to say, with the unenlightened public, "Bees *make* honey," than to say they merely lug it home and dump it like stovewood into a wood-box.

SOUND ON CELLAR-DOORS.

On page 626, Wm. M. Barnes is sound on cellar-doors—inch of dead air space *within* each door, and three feet of dead air between the two doors.

FOUL BROOD IN CUBA.

Sad to hear, as we do from W. W. Somerford, page 627, that all men and methods fail to cure foul brood in Cuba. With endless summer and infection everywhere, scientist and anti-scientist, doctor and faith-healer, alike "get left"—without bees.

SOME PRAYERS WISELY UNANSWERED.

Unanswered prayer. It seems, page 629, that the father of Mr. Doolittle prayed that he might fail with his bees. I suspect that a vast number of unanswered prayers are as unwise as that one was.

BLAMING THE BEES FOR RATTLESNAKES.

Judge Terral, page 629, is rather extreme in blaming the Holy-Land bees for the rattlesnakes in his apiary. Good example of the way a legal man can "soc et tuum" when he undertakes. (Snakes came because the weeds were tall, and weeds were tall because the bees considered their land too holy to have hoeing or mowing there.)

PINK COMB AND CRIMSON CLOVER.

That pink comb from crimson clover, eh? and pink honey, ditto. Let's keep that in mind till we can disprove it—or prove it. Page 633.

BEES THAT "WON'T GO HOME TILL MORNING."

In the Question-Box, page 634, Utah strikes a fresh and breezy sort of question—whether bees ever stay out all night—

Where is my wandering bee to-night,
Where is my wandering bee?
My heart overflows,
And I love her she knows,
Where is my wandering bee?

Most of the senators are prompt and sure in the affirmative. Half-a-dozen have doubts—else a fit of "the contraries." Mr. Green says not intentionally in any case. Probably true that they never *prefer* a lodging on a leaf to a lodging at home; but they will deliberately go to the woods when it will certainly be so dark that they dislike to fly before they can get a load and return. One of the unexplained mysteries of the bee is why at eve the change from readiness to fly, to great reluctance to fly, comes on so suddenly—get hundreds of bees on your clothes, and find it almost impossible to get them off, if you don't look a little out. I once had a case where many bees were robbing a room in the house where they had found some plunder. As the light began to fade many dozens of them got together in a corner of the room with evident intent to spend the night there, altho their hives were only a few rods away. I had let them alone till eve as the cheapest way to get rid of them—and was disgusted to find that I had to go to work and put them out.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. NOVEMBER 9, 1899. NO. 45

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Running Bees by Books is the heading of an item in *Gleanings in Bee-Culture*, which reads thus:

Bee-keepers tell me that I run my bees too much by the books; but my crop is over 60 pounds per colony, spring count, and theirs from 25 down to nothing.

L. L. TRAVIS.

A good book reinforced by a good bee-paper can hardly fail to put one's yield above the average of his neighbors who go bookless and paperless. Editor Root well says in his comment on this item: "The proof of the pudding is in the eating."

The Chicago Bee-Keepers' Association held its semi-annual meeting in the Briggs' House, Thursday, Nov. 2. On account of the stormy weather there was not a very large attendance. Rev. E. T. Abbott, of Missouri, was present, and helped to make it a profitable occasion.

The editor of the American Bee Journal was elected president, and Mrs. N. L. Stow as vice-president, and H. F. Moore as secretary-treasurer, were both re-elected. A report of the proceedings will be published later.

Sweet Clover as a Honey-Plant.—Mr. H. R. Boardman, of Huron Co., Ohio, says in *Gleanings in Bee-Culture* for Oct. 15, in reference to sweet clover: "I think it is the most valuable honey-plant in the whole world when compared acre for acre." We think so, too. Had it not been for sweet clover in the region around Chicago this year there would have been practically no surplus honey at all. When it is known that it seldom fails to yield some nectar,

and almost always produces richly, we believe bee-keepers will sow it more than ever. The honey is all right after one gets accustomed to using it, just like many another honey, and if found desirable basswood or other flavored honey can be added to it, thus forming a splendid article.

United States Bee-Keepers' Association.—We have received a neat little 4-page folder gotten up by General Manager Secor in the interest of this association, which ought to result in securing many members. It reads as follows:

THE UNITED STATES BEE-KEEPERS' ASSOCIATION

Was the natural outgrowth of a feeling among bee-keepers that they would have to look after their own interests, defend their own rights, and protect their own good name, or suffer the consequences. Other associations of other industrial occupations suggested the power of organized effort.

It is a little strange that an industry as old as bee-keeping is known to be, should be assailed, but in the complicated arrangement of modern civilized society, there are so many possible encroachments on the rights of others it is difficult to satisfy the demands of over-jealous dispositions.

Bees are "free commoners." They have no regard for the usual barriers which restrain other domestic animals. They forage where they will without regard to individual ownership or personal wishes. Well-informed people recognize their services as necessary to the complete fruitfulness of numerous flowers and fruits. But ignorance and stupidity look with jealous eyes upon the insignificant toll taken by the bee for her part in making the earth more fruitful.

Some persons have been found so devoid of reason and sense that they purposely scatter poison to kill their best friends, the bees.

Others living in or near towns innocently imagine that bees were made only to sting, and they would fain banish every bee-keeper from the bounds of urban society.

Others there are who purposely pervert the taste of the multitude by the sale of vile mixtures called honey, which never came in contact with a bee that were never sipped from fragrant flowers, nor stored in her waxy cells. They are the corruptors of common honesty. The adulterators need to be brought to justice.

The enactment and enforcement of pure food laws is not only desirable from every consideration of public morals and health, but is especially to be desired by bee-keepers who suffer from the unjust competition of cheap fraudulent compounds.

Experience has shown that there are persons engaged in the commission business who live upon the credulity of the consignors. This class needs to be watched and reckoned with occasionally.

And then there are the advantages which acquaintance brings to the members of fraternal associations.

Improvement and education along the lines of our industry, and a community of interest are some of the additional benefits to be derived from an association of bee-keepers.

Every person who believes there are reforms to be inaugurated or present laws to enforce, rights to maintain, or unjust prosecutions of bee-keepers to defend, is invited to join this association. There ought to be a membership of one thousand.

We shall be glad of your influence and help. Send \$1.00 to the undersigned, which will constitute you a member for one year and entitle you to a vote at the annual election by mail, and a copy of all reports issued.

EUGENE SECOR,

General Manager and Treasurer.

Forest City, Iowa.

All who desire may send their dollars to the Bee Journal office if more convenient, and we will forward them to Mr. Secor, who will then mail the receipts.

Irregularities of Seasons.—Under the head of "Uncertainties of Bee-Keeping," Harry Lathrop gives in *Gleanings in Bee-Culture* the results of 15 seasons in Wisconsin. There was one total failure for every five years, one heavy crop every three years, and seven medium crops in 15 years. The editor wisely thinks this is better than the average locality will do.

“The Reformed Spelling” is the caption of an article in *Gleanings in Bee-Culture*, by E. B. Thornton, in which Mr. Thornton makes a strong plea for a better spelling, quoting from the editor of the *Independent*, as follows:

The editor of the *Independent* puts the matter in its true light when he says that the whole matter is one that “properly belongs to the societies for the prevention of cruelty to children.” “The weariness, the tears, the blotted copybooks, the nervous strain we put on our children, are our shame.” “We are often told that our children are far more backward than the children of other languages. How can it be otherwise? The time that we waste in learning to read and spell, a German or Spanish or Italian child can give to his arithmetic and geography.” “Many more children could go to the high school and to college if their years and their patience had not been exhausted in useless labor at the very threshold of learning.”

Pitman tried for 50 years to make a complete job of it on a thoroly phonetic basis, and he accomplisht little more than to call attention (not always favorable) to the subject. American reformers in the meantime have brought forward not less than a dozen different systems, but no one would adopt them. The trouble with them all is that they are too good. They go too far. The only advance that has ever been made on this line has been made by the step-by-step method—a word, or a class of words at a time.

Mr. Thornton pleads for the spelling recommended by the National Educational Association in the following list:

Program (programme); tho (though); altho (although); thoro (thorough); thorofare (thoroughfare); thru (through); thruout (throughout); catalog (catalogue); prolog (prologue); decalog (decatalogue); demagog (demagogue); pedagog (pedagogue).

Editor E. R. Root offers this footnote to Mr. Thornton's article:

Personally, we (the Root Co.) approve of the changes suggested by the National Educational Association; but we do not know whether our readers would sanction it or not. For an experiment we will lay the matter before them; that is, we should like postal-card votes on the matter. All those who fail to vote, we shall assume have no preferences one way or the other, so that a majority of those who do vote either for or against may decide.

These changes are very moderate, and are not such as would shock the average reader. I have always felt, however, that to spell the word *past* for *passed*, and carry out this rule all thru was perhaps going a little too far, because it includes such a very large class of words, and really saves but little in the way of type; but when, for instance, we can omit *ugh* from the words *though*, *although*, *through*, *thoroughfare*, etc., *uc* from *catalog*, *decalog*, etc., and *nc* from *program*, then we are making a step in advance, and about as big a one as would seem to us wise for us to take. We have already begun it by spelling *programme*, *catalogue*, *catalog*, and none of our readers have interposed or objected. Now, will they if we go one step further? I feel that we can hardly be in sympathy with the movement for shorter spelling without at least putting that sympathy into tangible form.

The spelling reformers will no doubt be glad to see this admission, as they will probably call it, that the reform is coming, and that leading publications do not want to be left too much in the rear. But if it is to be left to a popular vote, it is not at all certain that any reform will ever be made. Reforms do not come in that way. Reformers are in the minority, not in the majority. If the matter had been left to the popular vote, we probably would still be writing as many now living did in their earlier days, *Atlantick*, *Pacifick*, or as they still do in England, *honour*, *labour*, *candour*. If a vote had been taken by postal-card ballots, it is not at all certain that *Gleanings in Bee-Culture* would to-day be writing *program*, *catalog*. It is a case of disease. The taste of the public in the matter of spelling is vitiated and needs doctoring, and doctors do not always take a vote of their patients as to remedies.

Mr. Thornton thinks the reform should not be wholesale, but “a word or a class of words at a time.” Editor

Root seems to be in accord with this, providing the class be not too large, but draws the line at a class so comprehensive as that composed of a portion of the words ending in *ed*. He thinks *past* for *passed* does not save enough type, but *program* for *programme* does. If our esteemed friend will take the trouble to count, he will find that the saving is the same in each case—just two letters saved in each. But surely he cannot think that the saving of type is the chief thing. If an increase of type will more faithfully represent the sounds uttered, by all means let us have more type instead of less. Fortunately, the better spelling takes less letters. When a word is pronounced *past* there is no more sense in having two spellings for two meanings than there is in having ten spellings for the ten meanings of the word *cat*.

The Weekly Budget

PROF. A. J. COOK, of Los Angeles Co., Calif., writing us Oct. 34, said:

“We are having fine rains, and all Southern California smiles.”

MR. W. J. CRAIG is for the present acting as editor of the *Canadian Bee Journal*, and is doing well. Mr. Holtermann, the former editor, we presume is devoting his time to evangelistic work.

DR. C. C. MILLER attended the semi-annual meeting of the Chicago Bee-Keepers' Association, Thursday, Nov. 2, at the Briggs House. A good convention is always assured in advance when it is known the Doctor is to be present.

“MRS. HUTCHINSON has been home about six weeks. I mention this that our friends may rejoice with us.” So reads an editorial paragraph in the last number of the *Bee-Keepers' Review*. All will be glad to learn that Mrs. Hutchinson is again able to be at home.

MR. F. A. SNELL, of Carroll Co., Ill., was in Chicago last week, and attended the meeting of the Chicago Bee-Keepers' Association. Mr. S. is one of the oldest bee-keepers in the State, having had bees 40 years. He now has over 80 colonies. He is also a contributor to several of the bee-papers, as well as to farm papers.

REV. E. T. ABBOTT was here last week to appear with us before the meeting of the sub-committee of the Western Classification Committee, as we two were appointed a committee at Philadelphia to make an effort to get certain concessions on freight rates. The full meeting of the railroad committee was to meet in Milwaukee Nov. 7. We hope to be able to announce next week the result of the effort on the part of the committee appointed in the interest of rates of bee-supplies.

LADY HENRY SOMESSET, the noted temperance worker, of England, like many other sensible as well as titled people, believes in encouraging bee-keeping. Her ladyship, after giving particulars of the various branches of work carried on at her Industrial Farm Colony, at Reigate, goes on to say this recently in the *London Daily Mail*:

“We believe in work; but we believe that it should be varied, and as far as possible in the open air. Last year, in the 300-foot glass houses we grew a good crop of tomatoes. All the pruning and picking was done by the women.”

“The bees, however, are really our most successful venture. They have already repaid the whole of the original outlay, and given a profit as well. This season the eight hives yielded 300 pounds of honey, and the colonies were increased by swarms from 8 to 11, so that next season we ought to gain a very good profit, if the season is favorable.”

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

We deal almost exclusively in honey, giving it our closest attention all the year round.

We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.

We are acquainted with the most desirable trade thruout the country, and know exactly what their wants are.

We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?

We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

Errors About Bees are found in books in other countries as well as this. Le Rucher Belge mentions a school-book in which the readers are told that the queen has no sting! Nature did not wish that she should be cruel, or that she should exercise a vengeance that would cost her too dear, so she gave her no weapon to use in anger!

A Bath for Wax-Worms.—Mr. L. Glasspole tried carbolic acid, chloride of lime, and camphor, in vain, to protect a number of idle combs from worms. He then packed in a large tub all the combs it would hold, put two queen-excluders on, and two flat stones over all, then filled with water. A day later he threw out the water with an extractor, and found the worms dead. Then he dried the combs in a warm room.—British Bee Journal.

Close Spacing to Secure Worker-Comb has been strongly advocated, and A. Norton reports in Gleanings in Bee-Culture his experiments in that direction. He says:

"To make the experiment a fair one, the conditions should not be made such as to insure worker-combs, even with wider frames; so I did not keep the colony reduced to few frames at a time, as practiced by Mr. Doolittle when getting worker-comb built; but I gave them all at one time to the colony, and then left matters to take their own course. The frames were clamped tightly together with thumbscrews, so there was no possibility of there being more than 1 1/4 inches from center to center. The bees were half-blood Carniolan and golden Italian. From the worker-cell starters in part

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

Root's Column

THE ABC of Bee-Culture

Revised in 1899.

Just from the Press.

See what W. Z. Hutchinson, editor of the Bee-Keepers' Review, says:

ABC of Bee-Culture.

If there is any book on bee-keeping of which bee-keepers have reason to be proud, it is Root's ABC of Bee-Culture. I am reminded of this by the receipt of a copy of the latest edition, which is just out. There is probably no firm in the whole wide world possessing the facilities and advantages of The A. I. Root Co. for getting out a work of this kind. It has plenty of capital and a thoroly equipt printing-office. More than this, there is an experience of more than 1/4 of a century in actual, practical bee-keeping. More than any one else, an editor has an opportunity for being fully informed regarding the actual state of the industry which his journal represents. Thousands of letters from all parts of the country pass under his eyes each year. In order that the best possible advantage might be taken of the knowledge thus secured, The Root Co. have been to the expense of keeping the book standing in type. As often as new discoveries or changes are made, a corresponding change is made in the subject matter of the ABC. By this method the last issue of the book is up to date. It cannot be otherwise than that the edition just out is decidedly the superior of any previous editions. I might go into details, but the advertisement on the back cover of the Review has saved me that trouble. I can as thoroly endorse that advertisement as tho I had written it myself as an editorial notice. When a beginner writes and asks me what book he better buy, I unhesitatingly tell him, "Root's ABC of Bee-Culture."—and I have a book of my own to sell.

W. Z. HUTCHINSON,
Editor Bee-Keepers' Review.

The ABC of Bee-Culture can be had of any of the leading booksellers, or the publishers of many agricultural and horticultural journals; also of any bee-journal publisher or dealer in bee-keepers' supplies. If more convenient send your order direct to us. Price, \$1.20 postpaid, or this book with Gleanings in Bee-Culture one year for \$1.75, postpaid.

The A. I. Root Co., Medina, O.

of the frames they built about half or more than half of drone-cells. From one such starter they built a solid sheet of drone-comb, filling the frame. From about half the starters they built nice worker-comb, but in two such combs I found large quantities of drone-brood in worker-cells, tho the queen was a vigorous one, as shown by her record before, and also since upon being shaken with the bees into a hive with all worker-comb. Hence I conclude that 1 1/4-inch spacing is not to be depended upon to insure all worker-comb."

Keeping Track of the Stock.—Dr. Miller recommends in Gleanings in Bee-Culture the practice of marking in pencil on one of the sections of a super when taking it off, the number of the colony from which it was taken. "Then when you find a super of greasy-looking sections you know where to replace a queen next spring." He might have added that when you find a super of extra-white sections, you will know next year where to find a queen as a breeder, if she is all right otherwise. The editor thinks this a good point in favor of numbering hives.

Selection in Breeding is a thing that is in the hands not only of the skillful breeder, but to a large extent also in the hands of the average bee-keeper with half a dozen colonies. If he encourages breeding from colonies that show best results with fewest faults, improvement will follow. A writer in Le Rucher Belge says: "If the common race had been maintained in its purity by a severe selection, there would have been no need to import bees of foreign races." And yet, if the foreign race is better, its introduction might be a good thing.

Moths in Hives.—In the British Bee Journal, L. Glasspole says he has had great trouble with moths, adding, "A strong colony of bees can generally take care of their own combs, but they will only take care of the combs they cover, and one superfluous comb will sometimes prove a veritable nursery for the pest." This may sound a little strange to many American bee-keepers, who find a strong colony not only able to protect all the combs it covers, but twice as many idle combs besides. Quite likely the difference is in the bees, black bees being preferred in England, while Italians lead here.

Keeping Bees in Clamps has not been much spoken of lately, altho Dr. L. C. Whiting and O. J. Hetherington have practiced it for years successfully. Editor Hutchinson has lately visited Mr. Hetherington, and gives in the Bee-Keepers' Review two views of his clamps. The clamps hold 7 or 8 colonies each, having two feet of length for each hive, three feet wide, four feet high in front, and three feet high at back. Planer shavings are used for packing. The packing is left till time to put on sections, and the hives are left in clamp all the year round. The bees are well shaded, lie out very little in hot weather, and are not driven out of the supers in cool nights; but the hives are not handled so conveniently as when sitting singly in the yard, and more queens are lost.

Celluloid Bee-Veil.—The reason why I was led to the study of bee-veils was that the ordinary fine silk net that is used in ordinary bee-veils is so fragile that it breaks open in spots and allows the bees to enter. I have purchast such netting at stores that was, I was going to say, rotten, and I guess that is about as good a term as any to express the quality. A bee-keeper in almost any country is liable to get his head against a bush or a limb of a tree, and every bee keeper knows how handily a twig will catch into a veil and rend it. Then, a silk veil is worth from 50 to 75 cents, and is of such value that it ought to last longer. The veil I present has an old material for the back, and a new material for the front—at least I have never heard of its being used for this purpose. It is very thin, very

BEST WHITE ALFALFA HONEY

In 60-pound Tin Cans.

WE have been able to secure a quantity of WHITE ALFALFA EXTRACTED HONEY which we offer for the present at these prices, on board cars here in Chicago: Sample by mail, 10 cents; 2 60-pound cans, in a box, 9½ cents a pound; 4 or more cans, 9 cents a pound. **Cash with order** in all cases.

Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 20 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now, and 1½ miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc.,

Mrs. J. B. Ayers, Libertyville, Lake Co. Ill.

SURE HATCH INCUBATOR.

ADDRESS,
GEORGE W. YORK & CO.
118 Mich. St., Chicago, Ill.

transparent celluloid—as transparent as glass; very light, and quite flexible; and a large piece of it that will enable the wearer to see in every direction costs about 5 cents. The celluloid is attached to common white mosquito-netting. The total cost of material for the veil is about 12 cents; and when the bachelor bee keeper has plenty of leisure the making of it becomes a pleasure. When I first donned the thing I thought I should not like it; but now after a few weeks' use I am more and more in love with it. There is but little reflection from the bright surface into the eyes, and the reflection bothers only when the sun is not shining. The mosquito-netting, besides being cheap, is of large mesh, and allows a free circulation of air. The color also adds to the comfort.—Rambler, in Gleanings in Bee Culture.

Getting Bees to Clean Out Unfinished Sections is thus discussed in a Stray Straw in Gleanings in Bee-Culture:

"You can take partly filled sections and place them in the upper story of a colony; and the bees below, if you give them time enough, will empty them out and store in the brood-combs" (Gleanings, 724) For this 'locality' that phrase, 'if you give them time enough,' should be strongly italicized, making the time generally not less than six months. I've had heaps and heaps of experience on that point, with large numbers of supers, extending over years, with all sorts of insinuating devices, and I must humbly confess that I think I never got a single super cleaned out when allowing only one colony access to it. If any one has succeeded, I'll be effusively thankful for the trick."

Editor Root adds this footnote to the above paragraph: "We have had bees empty out partly filled sections in the upper story; but it sometimes took two months, and that is the reason why I put in the qualifying clause, 'if you give them time enough.' Taking it all in all, the bee-keeper had better not fool away his time and that of the colony in any such way as this; better—far better—pile the sections up in the cellar and let all the bees rob them out slowly."

HATCHING IN 10 DAYS

would be an improvement on the old way, but we can't do it. We CAN furnish an **ISAAC HATCHER** that will hatch all hatchable eggs, and do it with less attention than any machine made. It does it because it is made right and has all late improvements. Sold at a low price and guaranteed. Catalogue in 5 languages, Gets. **ROBERTS PATENT CO., Box 78, Des Moines, Ia.**

GENERAL ITEMS

Grateful for a Small Yield.

I cannot report a very large yield for the past year—about 2 000 pounds from 50 colonies. Still I am very grateful for that, as many in this vicinity have not enough honey to spread on their cakes a half a dozen mornings. G. H. LINCOLN, Clark Co., Wis., Oct. 28.

Results of the Past Season.

I started last spring with 4 colonies two of which swarmed once, one swarmed twice, and one did not swarm at all. The one that did not swarm gave me 54 pounds of nice white honey, which I sold for 20 cents per pound; the other 3 old colonies gave no surplus except one gave 8 pounds; 2 of this year's swarms gave me 51 pounds surplus, so in all I got 113 pounds of surplus honey. The reason I sold some of this honey is because I am aiming to make the bees pay their own expenses, for hives, etc., so that if I happen to lose them it will be no financial loss.

This is my second year, and I am well satisfied so far. I have not heard of any one near here that got any surplus this year. I now have 10 colonies in good condition for winter. LEWIS LAMKIN, Woodbury Co., Iowa, Oct. 24.

Bees Did But Little.

Bees have done but little here this season on account of the weather. I was noticing to-day that the clover on the roadside has started more than I thought it had, making the prospects for a clover flow next year very good. After a poor season following a severe winter bees haven't made much of a stir this season. E. B. TYRKELL, Genesee Co., Mich., Oct. 28.

Not a Good Place for Bees.

I don't believe this locality will be a successful bee-country. My bees seemed to do well in the early part of the season. I had 3 new swarms from 4 colonies; one colony cast 2 swarms, all early and strong ones. They did well until about the middle of July, then they killed off all drones, and to-day they have considerable honey. They built large, handsome combs, but did not get to fill them with honey. I may have to

ELECTRIC FEED MILL
We have put out this mill to meet the demand of the patrons of the famous Electric Goods for a good mill at a fair price. It is a direct grinder and absorbs or wastes no power in useless and expensive gearings. Cuts, crushes and grinds ear corn, and all small grains single or mixed. Price low. Circulars and prices free. **ELECTRIC WHEEL CO.,** Box 16, Quincy, Ill.

feed a little, but this may not be in any fault of the country. I believe where white clover exists it would be much more favorable for success. I imagine Missouri is a more successful State for bees. I have an acquaintance in Boone County, and he says they have a good crop of honey this year. They have plenty of white clover and buckwheat.

I am going to change my business to farming, with bees, chickens and fruit. I want to locate in a good place for bees. Oklahoma is the best place for fruit I have ever seen. The winters are mild. Bees can be left out all winter on the summer stands. G. W. MACK, Oklahoma Co., O. T., Oct. 23.

Honey Crop Poor.

The honey crop was very poor here the past season. I got 300 pounds of comb honey from 28 colonies, spring count, and increased to 56. Last year I had 700 pounds of comb honey from 11 colonies, spring count, and increased to 30. I lost two in the winter. Late swarms will have to be fed for winter. JOSEPH BETHKE, Sauk Co., Wis., Oct. 24.

Very Poor Honey Crop.

The honey crop was a very poor one with me this year—an average of 10 pounds to the colony, spring count, and I will have to feed some for winter. It was caused by bad management, and the freeze last February. I find it as important to flowers as to the bees, if you wish to make a success. I have experimented with several kinds of bees, and I find them similar to the human race—the dark or hybrids prove to be the best workers in the heat. An Italian queen fertilized by a native drone is my preference. I have two colonies of Adels, and they hold up well to three out of four of their recommendations—breeding, gentleness and non swarming—but for honey "no good," or they have proven so with me. I will give them one more trial, and if they fail, off comes the queens' heads. L. W. McRAE, Washington Co., Ala., Oct. 25.

Tiering Hives in the Cellar—Report.

I notice some inquiry lately about the manner of tiering hives in the cellar. The "Sage of Marengo" doesn't seem to have "caught on" yet to the best way to tier hives without bottoms. His objections to Pennsylvania's shelves (see page 662) all hold good in regard to the way he says to tier them.

Just pile them up the same as the Doctor does, and if you have a common bottom-

23 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 23 cents a pound—CASH—for best yellow, upon its receipt. Now, if you want the money PROMPTLY, send us your beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO., 118 MICHIGAN STREET, CHICAGO, ILL.

board, put 1 1/2 or 2-inch strips under each end to raise it that much from the hive below. To get them off the bottom you must pry them up a little (1/4 inch or so) a day or two before cellaring, and take a pretty cool day to carry them in. Have your cellar as dark as you can see to work in, and handle them extra carefully.

My report for the past season is, 40 colonies, spring count, 1,500 pounds comb honey, 100 pounds of extracted, and increase to 65 colonies; which shows a rather poor year, but we have just had a splendid rain and are expecting a "big crop" next year. E. S. MILES.

Crawford Co., Iowa, Oct. 27.

No Surplus Honey.

I started one year ago with 35 colonies and now have 110, and the past has been a dry season—no surplus from even the best apiaries in this neighborhood.

W. A. JOHNSON.

Los Angeles Co., Calif., Oct. 20.

Minnesota. The Minnesota Bee-Keepers' Association will hold its 11th annual meeting at the Court House in Minneapolis, Wednesday and Thursday, Dec. 6 and 7, 1899.

J. P. WEST, Pres., Hastings, Minn.
DR. L. D. LEONARD, Sec., Minneapolis.

Colorado. That "irrepressible" Colorado State Bee Keepers' Association will hold their annual convention Nov. 27, 28 and 29, in the State House, Denver, beginning at 10 a.m. As usual, the State Agricultural College will assist us. Every one should come loaded with ideas and subjects for discussion; those who cannot come should write soon to the secretary or the president and tell us what are the particular needs of your locality. The members will be the program—we know from experience that you will make a very lively convention. Come everybody—there is sure to be "a hot time in the old town." R. C. AIRIN, Pres., Loveland, Colo.
P. RAUCHFUSS, Sec., box 378, Denver, Colo.

Better Farm Poultry.

Intelligent interest in fine poultry is becoming more general from year to year. Evidence of this is the marked improvement of the Poultry Press and the attention paid to the subject by the more general farm papers.

No small credit for this is due to the breeders of poultry who have for years advertised their stock, maintained exhibits and contributed in many ways to arousing and stimulating the attention of the public at large. One of the names familiar to readers of the American Bee Journal is John Bauscher, Jr., of Freeport, Ill., whose card appears in another column. Mr. Bauscher has an immense establishment and makes a specialty of Farm-Bred Stock. He publishes a very complete and expensively prepared manual at a merely nominal price and solicits correspondence. Intending purchasers will do well to write him before buying, always mentioning the American Bee Journal when writing.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy

ELECTRIC

Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low-down wagon at a reasonable price.

This wagon is composed of the best material thruout—white hickory axles, steel wheels, steel hounds, etc.; guaranteed to carry 4,000 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired, and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will. Write for catalog of the full "Electric Line" to Electric Wheel Co., Box 16, Quincy, Ill. Mention the Bee Journal.

You Should "Watch" Yourself.....

Lest You get "Behind Time."

MARKET QUOTATIONS.

CHICAGO, Oct. 18.—The market is active and full quotations are obtained. A little fancy white sold at 10c, but sales are chiefly at 15c for the best grade; white, not strictly fancy, brings 13, 14 and 15c; amber grades range from 10c to 12c, and dark, 9c to 10c. Extracted, 7c to 8c for white, according to body, flavor and package; amber, 7c to 7½c; dark grades, 6c to 7c. Beeswax, 26c to 27c.
R. A. BURNETT & Co.

KANSAS CITY, Oct. 19.—The demand for comb honey is fair, and supply light. The supply of extracted is light, and demand good. We quote No. 1 white comb, 13½c to 14c; No. 2, 13c to 13½c; No. 1 amber, 13c; No. 2, 12c to 13c. Extracted, white, 7c to 7½c; amber, 6c to 6½c; dark, 5c to 5½c. Beeswax, 22c to 25c. C. C. CLEMENS & Co.

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13c to 14c; amber, 11c to 12c; and buckwheat, 9c to 11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c gallon. Beeswax quiet at 26c to 27c. HILDRETH & SEGELKEN.

CINCINNATI, Oct. 9.—The demand for honey, both comb and extracted, is very good, with prices much better than a few weeks ago.

Fancy comb finds ready sale at 15c to 16c; darker grades are hard to sell at any price. Good demand for all grades of extracted. White clover and basswood brings 8c to 8½c; amber and Southern at from 6c to 7c. Good demand for beeswax at 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth. We do not handle honey on commission—we buy for spot cash only.

BEAUFORT, Oct. 20.—Supplies of strictly fancy 1-pound combs are lightest for many seasons; such are held firmly at 14c; few sales, 15c; No. 2, from 12c down. We do not notice any extracted in market. It is wanted at from 5c to 7c per pound. Beeswax, from 28c to 30c per pound for fancy pure yellow. BATTERSON & Co.

SAN FRANCISCO, Oct. 25.—White comb, 11½c to 12½c; amber, 9c to 10c. Extracted, white, 7¼c to 7¾c; light amber, 6½c to 7c; amber, 5c to 5½c; Beeswax, 26c to 27c.

BOSTON, Oct. 13.—We quote: Fancy No. 1 white in cartons, 15c to 16c; A No. 1, 14c to 15c; No. 1, 13c to 14c. Extracted, light amber, 7c to 8c; amber, 6½c to 7c.

But little new to note in this market on honey. The supply still continues to be very short while the demand is naturally a little lighter, as the retail trade is not quite up to higher prices, still with the light stock they must evidently come to it. BLAKE, SCOTT & LEE.

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14c to 14½c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 8c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15c to 16c; No. 1, white, 14c to 15c; dark grades, 10c to 12c. Demand good and supply light. No extracted in market. White would sell for 8c to 8½c. Beeswax, 23c to 24c. M. H. HUNT & SON.

CLEVELAND, Oct. 18.—Fancy white, 16c; No. 1, white, 15c; fancy amber, 12c to 13c; No. 1 amber, 11c to 12c; fancy dark, 9c to 10c; White extracted, 8c to 8½c; amber, 7c to 7½c. A. B. WILLIAMS & Co.

WANTED.—Comb and extracted honey; state price, kind, and quantity.
R. A. BURNETT & CO.,

BIOCRAPHICAL

G. W. Bell, His Boys and Bees.

MR. BELL was born in Pennsylvania March 12, 1860. His father was a farmer and lumberman, so "G. W." worked on the farm in summer and lumbered in the spring, going to school in winter. He taught two terms of school, and in the spring of 1883 he entered the mercantile business, in which he continued until last fall.

The spring of 1884 he married Miss Mamie Newcomer, and their family now consists of the seven boys shown in

the picture. When all of those little "Bells" get to "ringing" what a time they must have in that home!

Mr. Bell was appointed postmaster at his place in Clearfield County in 1883. He was instrumental in having the post-office established, and held the position for nine years. During that time he was twice elected justice of the peace, has been tax-collector four years, school director, and auditor in fact, he has been in office since 1884, and came within 24 votes of being elected to the State Legislature. Mr. Bell doesn't look like a politician, either. We have had the pleasure of meeting him at several conventions, the last time at Philadelphia, in September last.

He commenced to keep bees in 1888, getting two colonies, and has been very successful, considering that his locality is not overcrowded with good nectar-yielding plants. Still, he has succeeded in getting more honey per colony than any of his neighbors. He has Italian bees, and tries to keep them pure, introducing new queens every season. The past season he increased his apiary from 59 colonies to 98, and took 2,700 pounds of honey.

Mr. Bell and his boys had just come in from the corn-

Mr. G. W. Bell, of Clearfield Co., Pa., and His Yard of Bees and Boys.

field when the photographer happened along, and as the latter was in a hurry, they all went into the apiary just as they were. The two boys at the right are twins, 5 years old; the next one is the youngest, 3½ years; the next, the fourth, 10 years old; next, the fifth, 8 years old; next, the sixth, 12 years old; and the one on his knees is the oldest, being 15 years of age. Mr. Bell informs us that none of his boys are afraid of the bees. Should he be able to make bee-keepers of all those boys, what a large number of out-apiaries they could manage. In case they should ever decide to do this, they would need to go West to the large alfalfa regions where there is plenty of room for both boys and bees.

THE EDITOR.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 709.]

After the general discussion Hon. Eugene Secor read the following paper on

Fads, Fancies and Follies in the Apicultural World.

YANKEE GENIUS.

A live Yankee's an experimenter,
As most of you here understand;
He has breathed the pure ozone of freedom
So long in this limitless land,
And been wooed by the goddess Invention
Till every old method is scanned.
What appliance, machine, apparatus,
Or anything heretofore planned,
Is quite perfect till the light of his genius
Shines thru the "American brand?"
The Dead Sea of unworkt opportunity
Recedes when he raises his hand!

INSPIRED.

Not content with the ways of his father,
Believing himself the grantee
Of the brains of the last generation,
The pride of the family tree,
He is anxious to show his kinsmen—
And all the good folks yet to be—
The paved highway to fame and to fortune,
Which others, before, failed to see.

THE PROOF.

Hence the shelves of the Government office,
Where models of patents are kept,
Are the wonder of every beholder
That into the building has stept;
They convince the observant on-looker
That Yankee inventors ne'er slept.

PATENTS ON YOUTH.

They have patented every idea,
Yes, every conceivable thing,
From a mammoth steam thresher and stacker
To the tiniest baby-swing;
And I'm waiting, impatient, for patents
On *Youth* and perpetual *Spring*—
For these thin, wintry locks are embarrassing
When bees 'round my cranium sing;
And we're loth to resign the ambitious
Which flowery young manhood did bring.

IN PARENTHESES.

By the way, this proud eagle of Freedom
Has not been confined in its flight
To *inventional* vauntings and soarings
To lead this old world to the light.
He once crackt an old bell in this city
Proclaiming the reign of the right;

And from that trying time to the present
Old Glory's been always in sight;
And the eagle still screams 'bove the rattle
Of musketry, "Fight for God! fight!"

AN APOLOGY.

But as this is a bee-men's convention,
Not held on the Fourth of July,
And as my subject is better adapted
To blowing your follies sky-high,
Than to waving the national banner,
I return to my task—and sigh—
For I'm thinking you'd rather hear something
Of new things—of something to try,
In the place of reviewing old skeletons
From wrecks of the days going by—
And it's pleasanter to feed you with taffy
Than to witness your faces awry—
But the example of George the Immortal
Points straight to the truth—that's why
I am giving you doses of tansy
Instead of all candy and pie.

BEE-KEEPERS EXCEL.

Now, if Yankees in general are smart enough
To give us so much that is new,
Pray, what might be expected from bee-men—
The cream of the whole blessed crew?
There is something so strangely bewitching
About the bee-business that few
Can resist the temptation, when in it,
To show the great things *they* can do;
For the novice behind a bee-smoker
Is burning with "try," thru and thru.
"There is room at the top"—thus he muses—
"And I'll give the world *more'n* a cue
In the art of improving the fixtures
And methods in use hitherto."
And until he has hatcht a new theory
He heeds not the warning curfew—
But just wait! here's a child of his genius,
Laboriously born, take a view:

THE SELF-HIVER.

The contrivance is called a Self-Hiver;
Its object exceedingly plain;
T'is intended to fool Mrs. Queenly
And all her worshiping train.
Some fine morning they plan for a frolic—
And nothing their zeal can restrain—
But our genius, without pressing a button,
Stands by and repeats this refrain:
"Now I've got 'em, I've got 'em, I've got 'em,
I'm sure they will bring me much gain!"
But just how they enrich his exchequer
I've waited for answer, in vain.
(Would you get the most eggs from a turkey?
Just humor her whims, in the main.)

THE NON-SWARMER.

There's another ingenious invention,
First cousin to that just described—
With an itching to try something novel
How easy is error imbibed!
A non-swarmmer is lovely in theory,
But over its grave is inscribed:
"Here lies one that was born in a hurry,
And died without clergy—proscribed."

REVERSIBLE HIVES.

Please reverse the old dial of your memory
Some half a score years, more or less;
Does the hive with that recently wonderful
Reversible feature impress
The bee-keeper of *this* day as useful
And needful to compass success?
Does the man that gets honey now use it?
Don't all in a chorus say yes!
The reversible function is obsolete,
If this one's permitted to guess.

MOTH-PROOF HIVES.

Hid away in some store-room or garret,
Mayhap, when not looking, you'll find
A reminder of times when some peddler
Grew fat till his face fairly shined,
As he traveled from farmstead to farmstead
Unloading his hive—and his mind

With a silvery tongue which for smoothness
 Beat lightning and tallow combined.
 Simple farmers who knew none but box-hives
 Were ripe for a deal of his kind.
 Clever agents for moth-killing patents
 Were welcomed and cided and dined
 In the coveted days of the by gones
 When wax-worms—and others—were blind.
 Now, perhaps all such folly is ancient,
But hist'ry is always behind.

THE BUREAU HIVE.

In the dimness of past recollections
 I see such a beautiful hive,
 The deft work of a cabinet-maker,
 No doubt—he alone could contrive
 Such a lot of nice drawers and compartments,
 In which the bee-farmer could dive
 For the sweets of the fragrant white clover
 When company staid after five.
 But the plagny old bees are so stupid

Hon. Eugene Secor.

They chink all the cracks, and deprive
 That poor granger of all reputation
 For piety—while he's alive;—
 For if anything sticks like propolis.
 Old habits will stick and will drive
 Till the last mortal grip of our nature
 Lets go—like the drawers in that hive.

APIS DORSATA.

There is something within us that's longing
 For what is unknown and unseen,
 And we hope for a prosperous future
 No matter what yesterday's been.
 Don't the things which elude our endeavors
 Appear most alluring in sheen?
 'Tis the grass just outside of the pasture
 That's greener and sweeter, I ween.
 Just at present we're gazing toward sunrise,
 Where Apis dorsata is queen,
 And so great is our love for the latter
 The golden Italian looks mean.
 We are bound to have her of the Orient,
 Tho Dewey's whole fleet lies between,
 And we have to confine her, when gotten,
 With tether, or Page's wire-screen.
 There will be no more use for old Bombus!
 Red clover'll be sucked slick and clean
 By that wonderful Apis dorsata—
 Get ready your honey-machine—
 Since the failure of bees that are stingless
 We'll never again be so green!
 Give away your old, poky Italians
 And court the young Miss Philippine!

DEEP-CELL FOUNDATION.

In this era of ready-made clothing
 For both men and women, I trow
 'Tis not funny that ready-made jackets
 For young baby bees are the "go;"
 To expect the young nurses to make them
 In this day and age is too slow.
 Hence a recent fad out is foundation
 With cells so deep bees do not know
 The first principle of starting in business—
 The joy of beholding things grow.
 That old saw about having our pitchers out
 To catch the first nectarine flow
 Needs revising when combs made to order
 Shall fill liv every hive in the row.
 Mrs. Bee may yet lose her employment
 If matters keep going on so;
 For, but one further step is now needed
 To save her the trips to and fro—
 From the hive to the orchard and pasture
 Where blossoms so temptingly blow.
 When the next budding genius shall enter
 The domain of Beedom and throw
 In our laps a machine that's a *capper*,
 The cake of the bee-man is dough.

THE CRITICS.

The departments for critics appearing
 In journals devoted to bees,
 Is an idea that *some* of us writers
 Don't relish as we do green peas;
 For it frightens us out of our senses,
 And makes us feel weak in the knees.
 The *great need of bee-keepers is grammar!*
 They need it at least if they'd please
 The dear critics, for *they* admit Miller
 By only the narrowest squeeze—
 And if *we* should misplace a capital,
 Or fail, just once, to cross our t's,
 We should look for the sting of the critics,
 Who feast on such fool things as these.
 I have found that it's easier than preaching,
 To pick up the parson, when he's
 Got more sermons, and better, in his noddle
 Than all of his critic trustees.
 But it seems as tho *style's* more important
 Than *facts*, with some people one sees,
 So I give you this timid injunction:
 When critics take snuff, *let all sneeze*.

CONCLUSION.

But I tire you with multiplied mention
 Of follies and fads new and old;
 There are others which might be included,
 Requiring a volume to hold.
 I might speak of more *present-day* theories
 The worth of which time will unfold,
 But I hate to bury a baby
 Before it is thoroly cold;
 And, besides, if I happen to miss it
 My own knell will likely be "knolled;"
 So I leave this rich subject for future
 Embalming by spirits more bold.

EUGENE SECOR.

Dr. Miller—In this discussion I move that the speakers be limited to 15 minutes. (Laughter.)

Mr. Abbott—I think this paper should not be past by without discussion, and it reminds me of a man who had not time to pray, so he had a parson write a prayer, and then he would point to it and say, "O Lord, them's my sentiments."

At this point a recess of 10 minutes was taken, after which it was voted to proceed with

THE ELECTION OF OFFICERS.

Dr. Mason—I suggest that we vote for president, vice-president and secretary at the same time, and on one ballot. The suggestion was agreed to.

Dr. Mason—I nominate Ernest R. Root, of Ohio, for president; and L. D. Stilson, of Nebraska, for secretary. W. Z. Hutchinson was also nominated for president, and G. M. Doolittle for vice-president.

On motion it was voted that the secretary be instructed to cast the ballot of the convention for Mr. Doolittle for vice-president, which the secretary did.

Mr. Stone and Mr. Hershiser were appointed as tellers.

Mr. Abbott—I don't believe in trading off a horse that has been tested and found faithful, so I nominate Dr. Mason for secretary.

The ballot resulted in the choice of E. R. Root for president, and Dr. A. B. Mason for secretary.

COMMITTEES ON HONEY, FREIGHT RATES, AND THE APIARIAN EXHIBIT AT THE PAN-AMERICAN EXPOSITION.

Pres. Whitcomb—I have been requested to appoint a committee of three to pass on the honey that is on exhibition, and I will appoint Messrs. Hutchinson, Selser and Doolittle as such committee.

Mr. Abbott—I would like to have a committee on freight rates on bee-keepers' supplies appointed by this convention. There is in the West a class of bee-smokers that have always been shipt as first-class. Just before I came away I shipt smokers, and the freight was high. There is no reason why bee-men should pay first-class for tinware. I would like to have the question brought up. I am going before the classification committee when I go back, and I would like to have the influence of the Association. I have always shipt hives nested, and I suppose I have saved bee-keepers a good many dollars. That is a matter that I think the Association ought to take up before the Western Classification Committee. I have been looking the matter up, and it seems to me that it can be properly presented. The Western Classification Committee has raised the classification so that there is 8½ cents put upon the consumer. Now the consumer is interested. I am not selfish about this, but I would like to see something done in the matter.

Mr. Root—I would like to amend that matter, and have Mr. Abbott appointed as a committee of one. He knows all about the matter, and if he has the influence of the Association, he can do a great deal.

Mr. Abbott and Mr. York were appointed as such committee.

Mr. Danzenbaker—Mr. Abbott speaks about hives being nested. Take a 10-frame hive that has a super and you can put in another hive, and turn the body of the super and you can get in another hive. It takes no more room, and the bodies are nested into each other. I advise people to do this and save 50 percent on freight.

A letter from the Pan-American Exposition, to be held in Buffalo, N. Y., in 1901, was read, requesting the Association to appoint a committee of three which shall be advisory to the committee there, who shall have in charge the apian exhibit. After some discussion, on motion of Dr. Mason, the president was instructed to appoint a committee of five. Messrs. E. R. Root, of Ohio, W. F. Marks, of New York, George W. York, of Illinois, W. A. Selser, of Pennsylvania, and O. L. Hershiser, of New York, were appointed as such committee.

SECOND DAY—EVENING SESSION.

The evening session was called to order by Pres. Whitcomb, and was opened with a song, "The Hum of the Bees in the Apple-Tree Bloom," sung by Dr. Miller, after which came a paper by W. A. Selser, entitled,

The Products of the Honey-Bee - Wax, Propolis and Honey.

When your worthy secretary wrote asking me to read a paper I replied that I would, and he could select any subject that he desired. He said he preferred me to select the subject; after choosing my subject as above, he replied by saying he had put me down for that subject, but he desired me to say all I could about marketing of honey, and was sorry I had not selected that subject, but that now it had been assigned to another, who he thought was not quite as familiar with the large cities in the Eastern market as I was, and I would present an entirely new phase of it; in other words, he wisht me to read a paper on marketing and selling honey under another heading. I say this as an explanation that if I dwell more at length on some phases of marketing honey than I do on my title subject, you will understand why I do not stick to my subject.

First, then, the products of the bee. For some reason the word pollen was inserted by mistake for wax; pollen is a product of a flower only produced by Nature to further the race, and produces fruit, but used by the bee to dilute honey and make what we call "bee-bread" to feed the young bees. Beeswax is solely the product of the honey-bee; it is at first liquid, derived from the blood by cell action, and then transuding the structureless membrane and assumes the slight form of a scale.

The abdomen of a worker-bee is arranged in six dorsal and six ventral inelastic plates which may move upon each

other, because they are united by delicate membranes, giving to the whole the arrangement of the tucks of a child's dress.

These membranous glands are as smooth as glass, and present a flat surface from which the fluid wax is distributed and instantly cooling becomes flaky. There are eight of these cooling-dishes on the abdomen of the worker-bee. Any one taking up a bee during the honey-gathering season, and examining it under a glass, can see these scale formations.

Original beeswax on being supplied to the glands is pure white, but we cannot get it in this condition for mostly it is slightly varnished by propolis, which takes the hue of the flower the bee is working on. We can bring it back to its original color by lenses under the direct rays of the sun, and is much sought for by the drug-trade, and brings from 20 to 25 cents a pound more than the other beeswax.

Propolis is used by the bees as a cement and a varnish in the new comb. The cell-walls are varnished by it, which makes them stronger. It is gathered and carried in pollen-baskets as is pollen, and is thinned down by the bees themselves. It is taken from the leaf-buds of various shrubs and trees, such as poplar, alder, beech, willow, fir, and others. It is hardly necessary to add that it is a great nuisance to the practical bee-keeper, sticking to the fingers, and varnished over all his nice, polished sections.

Honey is the desideratum of the bee-keeper, if not the bee itself. Honey is evaporated nectar converted from cane-sugar into a grape-sugarlike substance by the bees, in their honey-pouch, by mixing a saliva provided by Nature for that purpose, and then deposited in the cell.

Bees cannot make honey out of granulated sugar, nor can they make it out of any other artificial, sweetened syrups. While an article so fed might be mixt with the bee-saliva, yet it is not honey unless it is the nectar provided by the plant-life. Nectar is the fluid which flows at the time of the plant's fertilization, and is of a peculiar chemical property, and cannot be made artificially under any conditions. Chemical analysis has reached the stage in which the slightest percentage of artificial adulteration of honey can be detected.

When the nectar is so mixt by the bees and deposited in the cell, it is thin like water, and is 25 percent solids, and when evaporated by the bees it is 75 percent solids. This is done by a very rapid action of the bees' wings, and so quickly that honey extracted that is gathered in the morning and left in the hive over night, is much heavier than that gathered and extracted in the afternoon of the same day. Many large extracted-honey producers mark their packages "morning honey" and "afternoon honey."

When honey has reached the degree above noted, the bees cap it over and then it is pronounced right for the market. I hardly dare more than touch upon these things, for I fear I will get into a very ocean of thought and development that would occupy one of your entire sessions, if not the entire time of the convention, so I pass quickly on to some of the phases of marketing honey.

First, the man himself, the bee-keeper or salesman. How shall he achieve success? How can he sell his product to the best advantage? Not every man can be a successful salesman—it is a gift. I am now presuming he is marketing his own product, but there are certain characteristics that he must have at least a share of if he is to succeed. One is honesty. Why, you start at once to say, "Do you question such a thing?" I reply by saying that after spending 20 years of my life as a salesman, and coming in contact with the men of almost every nation, I find that misrepresentation and falsehood are the ground-work upon which a large percentage of salesmen try to build up their business. It often succeeds for awhile, but eventually it is bound to fall.

If yours is light basswood honey, don't call it white clover. If your honey has 10 percent of sugar syrup to keep it from granulating, don't call it pure. (Don't feed your bees on sugar to build up on in the spring, after you put on the supers or top story). If your honey is carried over from last season, don't say it is the new crop. If you sell to two stores near together, don't tell one he is the only store you "sell to in this vicinity." It is not good policy to mention to any customer the other customers you sell to, or the amount. First, it is an unkind thing to expose your friend's business; and, second, if it is an extra-large amount you have sold him, the other grocer will at once doubt your assertion anyway.

Again, don't believe all your customers tell you, for many things are said in a half-serious tone to get you to drop in price, and they really don't mean to tell you a direct

falsehood. For instance, when you show your customer a comb of fancy white clover, and say you ask 16 cents, you find he will reply to you very often, "I can buy some very nice honey at 11 cents;" but he doesn't tell you that it is buckwheat or some other honey much inferior in quality.

Again, you must make a study of human nature. Some customers you can slap on the back and say, "How are you, old fellow?" Others would be shocked at such proceedings, and order you out of the store. Here is a great secret of the salesman who studies his customer, and learns his personality and caters to it; by so doing he can often secure a buyer that will not leave him for either cheaper prices or better quality, and this is the trade that is worth having.

Remember honey is a luxury, not a necessity. If your customer is busy, don't bother him. If he likes a joke, tell him one. If he likes a little history about bees, give it to him. If he is fond of honey on his own table, present him a jar or comb with your compliments, and then be honest with yourself. There is an old saying that if a man tells a lie repeatedly, in time he himself will honestly believe that it is the truth.

We become very much biased by what honey we produce ourselves; but because we may produce white clover or other honey it does not make it for that reason alone the best goods. The man from Florida says mangrove or palmetto is the best in the world; in California, the sage; in the Carolinas, the ti-ti; Maryland, the blue thistle; Colorado, Utah and Arizona, alfalfa; New York, basswood; Pennsylvania, the clover; Delaware, smartweed and heartsease; Michigan and Wisconsin, willow-herb—and so on.

Now you ask me who is to be a judge to decide what honey is the best honey produced by this country to-day, represented by this session. While I realize that cultivated taste has largely to do with a man's judgment of which is the best, the only way to decide is by popular judgment, and not from any locality. Having traveled very extensively over the United States and made this a special subject of study, I would not question for a moment the popular verdict, which is for white clover; and I will say that if you took one man from every State in the Union and sent him samples of all the honeys from the different States that I have mentioned; let him be a man who does not use tobacco or liquor in any form (as tobacco and liquor both destroy the nerves of taste in the tongue and gums), and let him be a man who is in no way interested in the honey-business, and if three-fourths of them don't decide that white clover is the best then I don't know anything about it; but I have tried it so often, and know the territory, and the verdict has always been the same.

Another condition that the producer of honey has to deal with is what is called the cut-throat competition of grocery-stores in our large cities. I believe in honest competition, and especially where the purchaser demands lower prices. Take for instance, a comb of honey. A grocer will not sell one more comb in a year at 17 cents than he would at 19, nor would he sell one more comb at 21 cents than he would at 23 cents. Your wife and family, or my wife and family, visiting the stores to make their purchases do not demand lower prices on honey, mainly for the reason that honey goes further than almost any other article of food purchasable, and being a luxury, and considered a delicacy, a few cents in price makes no difference.

Now we see every year a large firm here on a prominent street that fills their window full of comb honey. It is of inferior quality, but a very fair appearance. They do this every year, sometimes in August or early in September, and mark it at a price below which any other honest grocer can buy white clover honey and sell it at a profit. What is the result of this action? It immediately fixes the market for the others to follow, if they will, and in many cases the purchaser is the sufferer by the storekeeper being compelled to buy inferior goods to compete with his neighbor's prices.

If the purchaser demanded the low prices I would have nothing to say, but when the dealer uses honey as a "leader," and then makes it up on his teas, coffees and other articles, then the honey-purchasers are the sufferers.

And now, no doubt, you are anxious to know what packages are the best to put honey up in. I have been surprised, time and time again, to know the difference there is in different localities on this subject. One city 25 miles from another city will handle entirely different kinds of package. I would say that a large-mouth glass package is the best, and one that can be sold at popular prices holding one pound of honey, and less; where over a pound of honey is

desired a tin package is much preferable. These are sold very largely in 6 and 13 pounds.

The largest consumers of honey are the manufacturers. It is used by brewers who buy it in barrels, and tobacco manufacturers, as well as biscuit-bakers. One singular thing about the biscuit trade is that there is no honey produced in this country that keeps the freshness and moisture of the cake as well as Cuban and Porto Rico honey. Large lots of Porto Rico honey have been imported into the United States this summer, but, on account of the scarcity of other honeys, it has brought a good price. As this is to be embodied in a paper by another person, I will only say that our new possessions, to my way of thinking, are going to do a great harm to the bee-keeper.

While many things I have said in this paper are, no doubt, stale news to quite a few, there may be some here for whom I have dropt some thoughts that may be a benefit. If I have accomplished this, I shall feel fully repaid.

W. A. SELSER.

Mr. Abbott—Can honey be considered a luxury? It is not a luxury at my table; if we don't have it, my wife would feel the effects of it. I think we make a mistake when we teach that it is a luxury. I think it ought to be emphasized that it is a *necessity*. In almost any market you can get two pounds of honey for what a pound of butter would cost. If you can have but one, you would better let the Jersey butter go. It is all a matter of taste. I do think we should stop this talk about honey being a luxury.

Pres. Whitcomb—I agree with Mr. Abbott. I believe one pound of honey is worth more than two pounds of pork or 50 cents worth of patent medicine. Kidney disease is benefited by the use of honey. Children are liable to this disease, and honey will be of great benefit to them.

Dr. Mason—I have had it revealed to me why Pres. Whitcomb and Mr. Abbott were so sleepy this afternoon. They have not been having honey to eat since they left home! There is something more in this, it seems to me. In our locality extracted honey is not a luxury, but comb honey is. I cannot sell comb honey, but I can sell extracted honey, but I would not sell my butter three pounds for 25 cents, tho I do sell my honey at 10 cents a pound, or three pounds for 25 cents. Our president says a pound of honey is worth more than 50 cents worth of patent medicine. Well, that depends upon the medicine. Some medicines are worth more than their weight in gold in curing disease.

Pres. Whitcomb I did not say that. I said it would be worth more than *patent* medicine.

Dr. Mason—Now you are further off. You say I sell honey too cheap. I wish Mr. Doolittle were here to help me. There is one thing in which I agree with Mr. Selser. I have had charge of many exhibits of honey and other foods that require tasting in judging, and I never choose a man as judge who uses tobacco, or tea and coffee, if I can help it. Don't take a man who smells of tobacco and nicotine, and try to sell him honey by tasting it. He can't tell a good thing by its taste.

Pres. Whitcomb—Mr. Selser, what do the manufacturers pay for the poorer grades of honey for baking?

Mr. Selser—Five cents a pound.

Pres. Whitcomb—Now, why not take this honey and put it on the table?

Mr. Abbott—About 16 years ago my health failed me. My voice failed me entirely. I said I would be all right in a short time, and my brothers said, "Yes, he will be all right." I knew what they meant. I went out West to die. A man asked me, by accident, if I didn't want to go into the honey-business. I began to produce and eat it, and presently my voice came back, and I could stand up two hours and speak.

Dr. Miller—I have been trying to find out what you mean by the luxury business. Take two articles to sell, and tell people that one is a necessity and one is a luxury. Which one will they take first? There need be no conflict, because in a sense honey is a luxury and it is a necessity. I am not sure that we are making a mistake by calling it a luxury.

Mr. Niver I don't believe it will make a particle of difference. But I wish to dissent from one thing in the paper, and that is that you can sell as much honey at 19 cents as at 17 cents per pound. It is not down to hard-pan. When Mr. Doolittle tells of selling honey at a certain price, how much was wheat?

Mr. Danzenbaker—I differ from Mr. Selser in some things, but I agree with him in part. Not every one can produce honey; some people are afraid of the stings. There are people who buy it to eat, and as medicine. It is getting

to be fashionable in Washington to eat honey. Let it be announced that the President eats honey and you will sell plenty of it. Those who eat honey are better for it. Dr. Mason says he likes honey better than butter.

Dr. Mason—I beg pardon, but I didn't mean just that. Both are needed at our house, but altho I like honey, I feel sure if one—honey or butter—had to be banisht, honey would have to go. Mr. Danzenbaker has been telling of his success in selling honey in Washington, and I have been wondering if people didn't buy honey of him for the same reason that they buy of me sometimes—to get rid of me.

Next W. E. Flower, vice-president of the Philadelphia Bee-Keepers' Association, gave an address on

Source of the Honey-Supply in and Around Philadelphia.

Mr. Flower's address was illustrated by a large number of stereopticon views, and no report can be given that would present an adequate conception of the views shown, and of the wit and humor that seemed so readily to flow from Mr. Flower's tongue, often convulsing the large audience with laughter, and at some of his sallies that seemed to be unintentionally made, it took the venerable president and other staid members some time to work off, in hand-clapping and laughter, their stored-up surplus of appreciation of Mr. Flower's witty hits in describing some of the views.

The first view shown was a life-like picture of Father Langstroth. After a few deserved words of praise of the original of the picture, Mr. Flower said, "Now, in imagination, we will take the trolley and go to the home of Mr. Selser, and take a look at his apiary, a picture of which I show you. Mr. Selser never uses a veil or gloves when working with bees—in the winter time. [Laughter.] His neighbors say he is trying to get a cross between bees and lightning-bugs. They said nothing about his feet, which may be compared in size to those of a man who complained when a horse stepped upon his foot, and a by-stander remarkt, "The horse must step *somewhere*."

The next view was of Mr. Flower's apiary. Mr. Flower said, "My wife said I ought to have gone into the house and got my other clothes. I told her people could see these were not my *other* clothes."

The next picture was of Mr. Hare's apiary, who reports a yield of about 40 pounds per colony this year.

Several views of Germantown apiaries were shown, one of which, belonging to Mr. Melon, was located on the house-roof. Some of the bees have to go miles for honey.

Referring to another picture, Mr. Flower said: "This is a view of the apiary of John Connor, of New Jersey. Some fellow got stung in the rear—I mean some fellow in the rear got stung."

"The next picture is that of Uncle Rastus, who does not believe in the modern methods, a fact that his apiary well illustrates."

"This is the apiary of Mr. Geo. Burwell, and this is Mr. Hahman's. I want to say right here that no one has done more to make this meeting a success than Mr. Hahman."

"This is a view of Mr. Kugler's apiary. He gave a very good idea of the honey-plants around Philadelphia in his paper last evening. Mr. Kugler has a wonderful dog. She is longer in the morning than at night, for he lets her out in the morning and at night he takes her in again." [Laughter.] In answer to a question, Mr. Flower said, "I am like Dr. Mason; when I don't know a thing I say so."

Dr. Mason—Dr. Miller, you mean.

Views were given showing an extractor, how a beginner keeps bees, using veil, gloves, etc. Mr. Flower then showed, by means of a picture how the bee-moth destroys the comb, saying that Langstroth compared the work of the moth to sin.

A student once gave the following definition of a crab: "A crab is a red fish, and he walks backward." His professor said: "The crab is not a fish, it is not red, and it does not walk backward. With these slight inaccuracies your definition is correct." Mr. Selser's paper is the same. Pollen is not the product of the bee; propolis is not the product of the bee; wax *is* the product of the bee.

Next came pictures of the bee, showing the difference between the queen, worker and drone, also one showing the growth of the bee from the egg to the fully developed bee.

Some people say bees destroy grapes. Mr. Flower contends that they do not until after the skin of the grape is broken, and said he had never found any one who would say that the bee is really the aggressor.

There was no danger of ancient honey being adulterated, because there were no glucose factories.

A picture of comb honey was shown, of which Mr. Flower said he was proud. A display on the screen of clover, white sage, goldenrod, basswood, Rocky Mountain bee-plant, poplar blossom (which produces rich but dark honey) ended the illustrations.

[Continued next week.]

Some California Statistics—First Introduction of Foul Brood—A Word of Warning.

BY HON. J. M. HAMBROUGH.

IN the year 1856 Messrs. Buck and Appleton, of San Jose, Calif., placed upon the market 400 pounds of honey, which sold at from \$1.50 to \$2.00 per pound. This was the first honey placed upon the market, of which we have any record, west of the Rocky Mountains, and was certainly the initiative of the traffic that has done a great deal toward making California famous, for California sage honey has acquired a reputation in the markets of the world of the highest character, and the most astute of the pioneers of this industry is Mr. John Harbison, of San Diego County, to whom we are indebted for most of the information given us. Mr. Harbison is not only a pioneer in the bee-industry, but also that of horticulture. An early day writer says:

"During the fall and winter of 1855, and again in the fall of 1856, he (Mr. Harbison) made large importations of the choicest fruit-trees from the most celebrated nurseries in the East. From these importations was started that great series of orchards which line the banks of the Sacramento River and adjacent country."

A former letter covers the period from this date up to 1859, giving Mr. Harbison's experience in the introduction of the "Honey-Bee Upon the Pacific Coast."

In the year 1857 Mr. Harbison invented the section honey-box, an invention which has done more for the advancement of comb-honey production than any other discovery in bee-keeping. For this he was granted a patent Jan. 4, 1859. At the California State Fair held at Marysville in September, 1858, Mr. Harbison exhibited the first section-box honey. His fields of labor were largely confined to the region of Sacramento until the year 1869. In the fall of that year a partnership was formed between him and a Mr. R. G. Clark, for the purpose of introducing bees into San Diego County; 110 colonies from Mr. Harbison's apiaries in Sacramento being landed in San Diego on the morning of Nov. 28, being the first bees of which we have any record introduced into the county. Other importations soon followed, and the partnership continued for four years.

The great success attending the enterprise, and the world-wide fame of their San Diego County honey soon attracted the notice of bee-keepers and farmers from all parts of the United States. Many came here, took up land, establish homes, and embarked in the bee-keeping pursuit, with other rural industries.

Mr. Harbison kindly gave me the following figures relative to the success of the firm of Harbison & Clark:

In 1870, 3,750 pounds of comb honey; in 1871, 17,000 pounds. There were no other producers up to this date in San Diego County. In 1872, 30,000 pounds, all comb honey; 1873, over 60,000 pounds.

In the year 1873 the firm shipped the first carload of honey overland by railroad to Chicago, which was sold at 27 cents per pound wholesale.

The following years, 1874 and 1875, being off years, Mr. Harbison was unable to furnish data. Emigration was also coming in, and the choice bee-ranches were fast giving way before the ax, grubbing-hoe and plow, and the onward travel of the hungry fruit-and-grain ranchmen have relegated the bee-men to the canyons and undesirable locations, there to make the best of their unfortunate conditions. Mr. H. adds:

"By this time the country had been settled up, and a very large proportion of the honey-producing vegetation cleaned off, thus destroying the bee-pasture, consequently bee-keeping has steadily declined, and only in the rougher

and isolated districts where any considerable number of apiaries are now found."

The following statistics I have from the San Diego Chamber of Commerce, which is a record of the number of carloads of honey shipped from that point, and does not include small shipments and honey shipped from other points in the county in carload lots:

1895, 75 carloads; 1896, 15; 1897, 85; and in 1898, 10 carloads.

Thus you will see, notwithstanding the obstacles thrown in the way of the honey-producers of San Diego County, our output is no small factor in the commercial world. It must be borne in mind that the seasons of 1896 and 1898 were extremely dry seasons, and "but little honey produced."

The first foul brood (according to Mr. Harbison) was introduced by a man by the name of Wheaton, in a large shipment of bees purchased from M. Quinby in the fall of 1858. They were located in the vicinity of Sacramento (this State). The disease was prevalent in the Mohawk Valley State of New York, and elsewhere in the Eastern States, but was wholly unknown at that date west of the Allegheny Mountains. Mr. Harbison says:

"Wheaton opened up his diseased bees within one-half mile of one of my apiaries near Sacramento. The consequence was, that over one-half of my apiary contracted the disease by robbing honey from the diseased colonies. I used heroic treatment, burning up bees, hives, honey and all. Colonies may have the disease for one, two or more years before dying out entirely, a condition that should not be tolerated. I know that when the disease once gets established it will be almost impossible to wholly eradicate it, but by constant care and heroic treatment it can be kept down so as not to cause serious loss, otherwise it will spread all over the country wherever bees may be kept, and also to those in rocks, trees, etc."

That the disease is still prevalent in California there is no question, and in the county adjoining that of our own; as to whether or not it has as yet shown its cloven foot in San Diego County I am not sure, but yesterday I was informed of 300 colonies that had recently been cremated, with the exception of 30, and that it was still prevalent, tho heroic measures were being taken to eradicate it from the region.

As foul brood inspector of San Diego County I would say to all bee-keepers: Be ever on the alert, and should the hydra-headed monster show up, give him no quarters. California statutes know of no remedy but annihilation by fire, and it behooves every bee-keeper in the land to know that it is not tolerated in the community; and he who is so care-for-nothing as to let his bees remain uncared for, with the disease lurking among them, is nursing an adder with which to sting his neighbors. Let this be your warning.

San Diego Co., Calif., Oct. 13.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

What Caused the Difference in Results Between Two Colonies?

Can you give me any information regarding a colony of bees that have failed to store honey the past summer? Another colony by its side—say about 20 feet away—stored some, not as much as usual, still enough for their own winter consumption, and a little for my use. The month of June was very dry here.

NEW JERSEY.

ANSWER.—Without knowing more about the case it would be impossible to say why one colony should give no surplus while another only a few feet distant should store more than enough for its own use. Even with full knowl-

edge of the case it might easily be that no satisfactory answer could be given. One of the puzzling things in bee-keeping, especially to the beginner, is the fact that it often happens that two colonies sitting side by side, having the same field in which to operate, to all appearance equal in every respect, should be so unlike in the results shown in the surplus apartment.

Even altho no positive answer may be given to the question, it may be profitable to give some of the conditions that *might* exist to account for a difference in the amount stored by two colonies.

There may have been a decided difference in the strength of the two colonies. Other things being equal, the strong colony would outstrip the other in storing. If a colony of 50,000 bees stores a given amount, it by no means follows that a colony half as strong will lay up half the number of pounds of surplus. The smaller colony will store much less in proportion to its numbers, and in a year when the stronger colony stores only a small amount the weaker cannot be counted on to store anything.

There is a difference in the character of bees. Some seem to be more vigorous than others, and more industrious. So there may be two colonies side by side, equal in numbers, but so different in industry that one stores much less than the other. And in this connection it must be noted that when a colony has stored only a pound of surplus in its super while another has stored 20, it by no means follows that the latter has done 20 times as much gathering as the former. It has not even gathered twice as much, but only about a third more. For it is estimated that it takes about 60 pounds a year for each colony for its own consumption. Very likely that is putting it too low, for it is hard to tell just how much is consumed each day by the colony during the summer season, but it is very likely much greater during the summer activity than during the semi-torpor of winter. And as a colony often consumes 30 pounds of honey from October to May, it may consume much more from May to October. But putting it at 60 pounds for the year's supplies, the colony which has stored a pound of surplus has gathered 61 pounds, while the one which has stored 20 pounds has gathered 80 pounds. So there need not to be such a great deal of difference in the diligence of two colonies to allow the one to store 10 or 20 pounds while the other stores nothing.

There may be a difference in the laying of two queens, one laying more than the other, or beginning to lay earlier than the other, thus making a difference in the strength of the two colonies.

Swarming may make a difference. Other things being equal, a colony of bees in the North that never thinks of swarming is likely to outstrip one that divides its forces by swarming.

Altho two colonies may stand side by side, one may not forage on the same ground as the other. It may happen that in an apiary where nearly all are gathering dark honey, one or more of the colonies may be storing light honey. In such case it is not hard to believe that the amounts stored may be unequal.

The brood-combs may account for the difference. Suppose one hive has nothing but worker-comb, while the other has the equivalent of two combs having drone-cells. A lot of drones is reared by the one colony, which not only gather nothing but consume a lot, while the same space is used by the other in rearing workers that add to the stores.

These are some of the things that may operate singly or together to account for the difference in the amount of honey found in the supers of two colonies standing side by side, and the list is by no means exhausted.

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

The Premiums offered on page 733 are well worth working for. Look at them.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. NOVEMBER 16, 1899. NO. 46.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Renewing Bee-Paper Subscriptions will soon be in order again. We trust that our readers will do this promptly. We believe they all feel that one dollar cannot be better spent than when given for 52 copies of the old weekly American Bee Journal; especially when they remember that they get 40 more copies than if it were issued monthly, and 28 more copies than if it were a semi-monthly.

There is another very important thing not to forget, and it is this: While nearly everything else is going up in price, the American Bee Journal will continue to be supplied at the usual figure—only \$1.00 a year. We are now compelled to pay more than a few months ago for the white paper on which it is printed; more for the printing, and more office rent. In fact, practically all connected with getting out a paper like the Bee Journal is higher in price now than a year ago, and still it will be furnished at the old price of a dollar for 52 numbers. We believe that our thousands of readers will appreciate this, and will not only renew their subscription, but will do what they can to get their neighbors and friends who keep bees to subscribe for it. If just one-half of our readers would each send one new subscriber before next Jan. 1st, the old American Bee Journal would have a larger list than any bee-paper on this continent has ever had.

We do not offer to give one or two other periodicals free with a year's subscription to the American Bee Journal, but we do promise to give our readers in the future as in the past, the biggest dollar's worth of good bee-literature to be found anywhere. The old American Bee Journal speaks clearly for itself each week—we need say no more than that.

More Experience with Honey-Barrels.—We wish to give a little further experience we had with handling honey in barrels early this fall.

We had bought four barrels of extracted honey in Wisconsin from a bee-keeper who had always put up the extracted honey in such a package. The honey was started off all right, but when it reached Chicago one barrel had only half the contents it had when delivered at the depot in Wisconsin. It was about 160 pounds short.

When our expressman was loading the honey into his wagon at the Chicago depot, the whole head of one of the other barrels came out, and before he could get the barrel up on end, fully half of that barrel of honey was spilt.

In all, there was about \$20 worth of honey lost in this one shipment. Now, \$20 would pay for quite a number of tin cans, which are ever so much safer for holding liquid honey. Of course, if the honey is granulated, then it is all right to ship in barrels. But we don't want to risk getting any more liquid honey in them.

Doubtless all honey that is in barrels now is thoroly granulated, so that it will ship with perfect safety.

Europe vs. America as to Honey.—A writer in the American Bee-Keeper having said that until a few years ago the United States produced only half as much per colony as other countries where bee-keeping is carried on scientifically, F. Greiner takes issue in the same journal. He thinks the reverse is the case. He is sure the average for the past 25 years has been much lower in Germany, if not thru all Europe. Formerly, in his part of New York, 50 pounds per colony was counted an average crop, now perhaps 30, and California and other States are better, while in Germany 20 pounds is an average, with, of course, exceptionally better yields. But the German gets the better prices, and has a splendid trade in live bees. In Germany there are estimated to be 1,964,726 colonies of bees, and in the United States 2,400,000.

The Government and Apis Dorsata.—Dr. A. B. Mason says in the Bee-Keepers' Review that we need have no fear but that desirable aid will be given bee-keepers whenever they ask for it as to introducing the big Indian bee. While in Washington lately he had an interview with the government official with whom correspondence has been had, and was told that whenever the United States Bee-Keepers' Association should be satisfied that it was desirable to import Dorsata, and would so inform the department, all the aid they could furnish would be gladly given; and if necessary the department would give all possible aid in securing the desired information. But the Doctor does not seem to be enthusiastic about the introduction of the foreigner until the possibility of its domestication has been demonstrated.

Honey as a Daily Food.—In Gleanings in Bee-Culture Anton Leister speaks of the value of honey as a food, not as a relish or appetizer. He thinks honey, as usually eaten—a relish after the main part of the meal—is likely to be injurious because of its richness in nutritive elements. But he does not merely theorize. For six months he tried using honey in what most persons would consider large quantities. Bread and honey was more than half his daily food, and it formed the entire meal at least once each day. But with such hearty food he did not sit idle, but worked hard, doing such work as sawing wood and pitching hay. Once or twice the honey made him sick, but he ate it before resting when very tired, and he thinks beefsteak might have had the same effect under the same conditions.

The point to be emphasized in the case is that honey is a food, having great nutritive value. Whole-wheat bread

with honey made at least one meal each day, other food being eaten with the bread and honey at the other meal or two, in order to make the proper variety. Some days he ate a pound of honey a day, averaging, week in and week out, a third of a pound a day.

Progressive Bee-Keeping. Root's "A B C of Bee-Culture" is a standing monument to the progressiveness of bee-keeping. It is literally a *standing* monument, for it is kept standing in type, each edition being brought up to date. Think of 67,000 volumes of this book being printed! That is something of a monument to the intelligence and progressiveness of bee-keepers. It is estimated that there are about 300,000 bee-keepers in the country. According to that, about one in four has a copy of the "A B C." Does one farmer in four own a \$1.20 book devoted entirely to farming? Does one in ten?

Reformed Spelling seems likely to get a foot-hold in Gleanings in Bee-Culture. It called for a postal-card ballot of its readers as to whether it should adopt certain reforms in spelling, and has received quite a number of responses favoring the reform, with only one dissenting vote. M. D. Andes wrote: "At first I was opposed to the changes, but after reading the American Bee Journal for a time I rather like it." Gleanings will be welcomed as a companion to help make people like what is good for them.

"**The Hum of the Bees** in the Apple-Tree Bloom" is the name of the new bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it post-paid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal.

The Largest Linden in the World, as Editor Root thinks, is pictured in Gleanings in Bee-Culture. It is in Linwood Park, 30 miles west of Cleveland, Ohio, and is truly a monster. It is eight feet in diameter, and inside there is a hollow in which there is room for six or eight people.

Bee-Inspection in Tulare Co., Calif.—Josiah Gregg, bee-inspector for Tulare Co., Calif., in his last report to the supervisors, gave information of wide interest. He was appointed for 25 days, and this is his summary of work for 15 days in March and 10 days in September, as reported in the Pacific Rural Press: In March he found and destroyed according to law, three cases of foul brood. In September he reports as follows:

"I have inspected all the apiaries that were known to have foul brood at any time, and all bees within a radius of two miles of all infected apiaries, and have failed to find a single case of foul brood; and I have reason to believe that the disease of foul brood has been entirely eliminated from the county of Tulare. During my last term of 10 days I have inspected 1,182 colonies, an average of about 118 per day.

"I find by a review of all my reports for three years, that in the year 1897 I caused to be destroyed 28 cases of foul brood; in the year 1898, 16 cases, and in the year 1899 three cases, a total for my administration of three years of 47 cases of foul brood.

"Apiculture is fast assuming an enviable position among the most prominent industries of the county of Tulare. In the year 1898 five carloads were shipped from the county, and during 1899 10 carloads will be shipped, being about 130 tons, all extracted honey. There has been but little comb honey produced, probably enough to supply the local markets."

The Weekly Budget

MR. O. C. FITTS, a bee-keeper of Kane Co., Ill., called on us Nov. 4, when in Chicago.

MR. F. A. GEMMILL, of Ontario, Canada, writing us Nov. 1, said:

"We had a fair season in our locality, but a poor season generally in Canada."

Mr. Gemmill is the assistant official inspector of apiaries in the Province of Ontario, so he has exceptional opportunity to learn of the general honey crop.

MR. GEO. W. COLLINS, of Larimer Co., Colo., called on us last week. He reports a good crop of honey in his locality the past season. He expects now to locate in Sonoma Co., Calif. Mr. C. said one bee-keeper in a town of about 2,000 population in Larimer Co., Colo., has a local trade that requires 40,000 pounds of extracted honey annually to supply it. The bee-keeper referred to has five apiaries, and sells his honey at 6 cents a pound at his home, the customers bringing their pails or other vessels to get the honey in. But 6 cents a pound is "away down" this year.

THE REPUBLIC OF CHILE is fast coming to the front as a honey-producing State. A German paper speaks of it as the California or Eldorado of bees. It enjoys a favored climate, greatly simplifying wintering. Bee-keepers in that country are ably represented by El Apicultor Chileno (The Chilean Bee-Keeper), edited by Juan Dupont-Lafitte, a man who is fully abreast with all that is going on in bee-dom. Chile might be represented by a green ribbon an inch wide and a yard long, its real length being about 2,000 miles. With the Andes Mountains on the east and ocean on the west it enjoys a fine climate for bees. Their summer is, of course, our winter. Gleanings in Bee-Culture.

HON. EUGENE SECOR, General Manager of the United States Bee-Keepers' Association, will attend the next meeting of the Minnesota Bee-Keepers' Association, to be held in the court house at Minneapolis, Wednesday and Thursday, Dec. 6 and 7, 1899. He will speak on "The Adulteration of Extracted Honey, and How to Prevent It." The latter part of this subject is just what bee-keepers in many places have long been wanting to know. We hope Mr. Secor has a successful method, for 'tis said, "An ounce of prevention is worth a pound of cure." Then there's no place on earth, we believe, where there is such large opportunity for applying a method for the prevention of the adulteration of honey as right here in Chicago. We would welcome with open arms both Mr. Secor and his prevention scheme—if the latter isn't patented!

MR. W. A. PRYAL, of San Francisco Co., Calif., writing us Nov. 4, said:

"I presume you have already been informed of the glorious fall rains we have had; the grass is now green everywhere, and the air is balmy and delicious. The October rainfall was the greatest ever recorded for that month in California.

"Recently I embraced the opportunity to make a friendly call upon Mr. Thomas G. Newman, and I was surprised to find that he can see with difficulty. He volunteered the statement that his eye-sight is getting so bad that he is almost blind. He attributes it to nervousness—he having head-troubles very much. I should say that in this latter affliction he is not altogether unlike the late Father Langstroth. I am very sorry for Mr. Newman's misfortune, and I trust he will soon recover his sight. He states that he hopes to take a vacation soon and spend some time in the mountains recuperating."

We had received a letter from Mr. Newman a few days before hearing from Mr. Pryal, in which was mentioned the affected eyesight. Surely, all will regret to learn of Mr. Newman's affliction, and hope for speedy and full recovery.

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

We deal almost exclusively in honey, giving it our closest attention all the year round.

We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.

We are acquainted with the most desirable trade throout the country, and know exactly what their wants are.

We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?

We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

HILDRETH & SEGELKEN,

120 and 122 West Broadway, NEW YORK CITY.

Prices in Germany.—Altho we may envy German bee-keepers the prices they get for honey, when it comes to livestock we would hardly be satisfied with some of their prices. In Gravenhorst's Bienenzeitung, C. Burgdorf advertises heather swarms at 63 cents to \$1.00, according to weight and strength, and laying queens after Sept. 15 at 25 cents.

As Others See It's.—W. Woodley, in the British Bee Journal, speaks in not the most flattering terms of the way some things are done in England, and says:

"Sections ought to be so carefully graded that every section in the dozen or gross is as nearly equal in quality and close approximation of weight as possible. This will have to be done if we are going to make progress. Many American bee-keepers use mechanical 'cleaners' for preparing their sections for market and adopt the 'no-drip cases' for transit. This arrangement prevents any 'drip' of honey from a broken section damaging the layers below. I have written on this subject frequently, and the more I inquire into the matter the more convinced am I that we Britishers are much behind in preparing our commodities for market; possibly necessity was the mother that brought forth the 'inventions' for improving these things elsewhere, but the fact remains that they have stolen a long march on us in these things, and, in consequence, command the best market prices for their painstaking labors."

As We See Others.—W. Woodley, in the British Bee Journal, tells family secrets about marketing honey, as follows:

SAVE FEED.

Feed is fuel to the animal economy. It is burned up to supply internal heat. If it is heated (cooked) before it goes it to the animal's stomach it saves that much fuel (feed). **Electric Feed Cookers** save feed, save money and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. Circular and price free.

Electric Wheel Co., Box 16, Quincy, Ill.

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

DON'T TAKE CHANCES!

Buy no Incubator and pay for it before giving it a trial. The firm who will not sell on trial have no faith in their machines. We sell the celebrated **PREMIER INCUBATOR ON TRIAL**. Also sole manufacturers of Simplicity, Catalogue and Poultry Helps, &c.

Columbia Incubator Co., 5 Adams St., Delaware City, Del.

Root's Column

The Home

— OF THE —

Honey-Bees

as seen thru the
Camera.

If you are not a subscriber to *Gleanings in Bee-Culture*, we will with pleasure send you free a copy of our double number which will be issued Nov. 15. This will contain 8 full pages of illustrations of our apiary and views of our factory, inside and out. To those who have never visited our establishment this will be a rare treat. The only condition is that you send your request promptly and mention the *American Bee Journal*. Absolutely no charge and the more applications we receive the better we shall like it. In this number you will find a dozen or more special offers for our bee-keeping friends, but these will not be given in this column; you must send for sample copy. Be sure to say Nov. 15th issue.

Watch for our ad. in
this column next week.

THE A. I. ROOT CO.,
MEDINA, OHIO.

"All my sections are carefully graded, and clean as hands and care can make them. Those of the finest quality and color (white clover and sainfoin), well filled and sealed (except cells next to the woodwork), with combs built out and attach to the wood of the section; such form our first grade or 'selected quality.' These we glaze in lace paper and pay carriage to London or other places of about equal distance at 10s. per dozen; the next, or second grade, at 9s.; and all below that we just sell for what they are worth—say 7s. 6d. to 8s. per dozen. We rarely have an inquiry for unglazed sections; and 'glazing' means a big job with our two large apiaries; but it pays."

And that's the bold Britisher that was talking about American bee-keepers commanding the best market prices for their painstaking labors. How many Americans take such pains in marketing? and how many get 21 cents each for sections, and 15½ cents for culls?

Queen-Cells Started Without Royal Jelly.—There has been some dispute as to whether it was the shape of the cell or the royal jelly put in with the larva that determined the bees to rear a queen. W. C. Gathright says in *Gleanings in Bee-Culture*:

"I have made many experiments, giving royal jelly to one batch of cells and another batch beside them without any; and if there is anything I am sure of about bee-keeping it is that it does not make one particle of difference whether you put in the royal jelly or not, either in artificial cups or drone-cells. Any one who wishes to prove this can go and examine the cell-cups, as I have often done, two or three times after putting in the royal jelly and the larva, and they will find the royal jelly licked out clean. I have examined them thus dozens of times, and never have found a single instance where the bees would leave the feed which I put into the cell. Even when every cell was accepted they have always removed the feed which I had put in, and then commenced to feed the larva to suit themselves."

Bees on the Farm.—If there are no bees within two miles of your farm, it would pay you to buy one or more colonies and keep them, even tho you should never take an ounce of honey from them. You need them to fertilize flowers of different kinds. Fruits especially. If at the time your apple-trees are in bloom it is so cold and wet that bees do not fly, you need not count on much of a crop of apples. If you look hastily at an apple-blossom, you might not think bees are needed to carry pollen to the right place, for are not stamens and pistils on one and the same flower? And will not the pollen fall of itself from the stamen upon the pistil? Ah, yes, but watch closely, and you'll see that Dame Nature has provided against such close breeding. The stamens and the pistils do not mature at the same time! So when the pistil is in a receptive condition, some outside agency is needed to bring the pollen from elsewhere, and this work is chiefly done by the denizens of the hive. Besides, there is more vigor in the fruit if the pollen is brought from some other plant or tree.—*National Stockman.*

The Doolittle Plan of Rearing Queens, as practiced by Mr. Doolittle himself, requires no queenless bees, the cells being started from the beginning in a story over an excluder, with a laying queen beneath. Some say they cannot get the cells started without first giving them to queenless bees; others say they can get a larger number started by first giving them to queenless bees. Here is the plan of W. C. Gathright, as given in *Gleanings in Bee-Culture*:

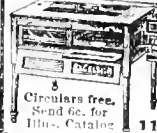

"About getting them accepted in colonies having a laying queen, I have had them accepted in upper stories, but it is very uncertain about the number they accept—generally very few; sometimes only one; so to make sure of getting enough I have them started in queenless hives. I can

BEST WHITE ALFALFA HONEY

In 60-pound Tin Cans.

WE have been able to secure a quantity of WHITE ALFALFA EXTRACTED HONEY which we offer for the present at these prices, on board cars here in Chicago: Sample by mail, 10 cents; 2 60-pound cans, in a box, 9½ cents a pound; 4 or more cans, 9 cents a pound. **Cash with order** in all cases.

Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

Dairy Farm For Sale

consisting of 235 acres, as good a farm as there is in Lake Co., Ill., located only 20 miles north of the Chicago court-house, on the old Chicago and Milwaukee stage-road or Milwaukee Ave. now, and 1½ miles from Prairie View on the Wisconsin Central railroad. The beautiful Des-plaines river runs thru the pasture, besides the timber land. Also 19 acres of good timber one mile northeast of Half Day, making 254 acres in all.

The farm is not only a splendid one for dairying, but is also a good location for bees. There is white clover, sweet clover, basswood, etc. The editor of the American Bee Journal has been on the farm and will confirm every statement concerning its value.

Address, for further particulars, terms, etc., Mrs. J. B. Ayers, Libertyville, Lake Co. Ill.

do this and still not have any queenless hives in the apiary. A few hours to half a day before giving the cells I remove the upper story from my cell-building colony, and place it on a bottom-board, then put a cover on the brood-chamber, and set it aside with entrance turned around; then the upper story is placed on the stand. Thus you see I have a colony made queenless ready to start the cells; then when the cells are well started, which will be in a few hours, the brood-chamber is put back on the stand, and the upper story, having the cells, is lifted off its bottom-board and placed back on the brood-chamber, having, of course, a queen-excluder between."

The New York Bee-Disease.—

Editor Root says this about it: "I have just received a letter from Bacteriologist Howard, of Texas, in which he says he has examined, microscopically, several specimens of affected brood sent from New York, and that *none* of them are foul brood, or in any way related to that disease. It is an entirely new malady, differing from pickled brood. Dr. Howard is not ready yet to make a complete report, but will do so later for Gleanings in Bee-Culture. In the meantime it is of the highest importance that the bee keepers of York State know the result of the experiments thus far, as it may save burning of colonies, and possibly of whole apiaries, for what is supposed to be foul brood, but which is not that disease at all. The fact that this new malady is in many cases reported to disappear of itself—a thing that real *Bacillus alvei* never does—rather confirms Dr. Howard's diagnosis. In the meantime, bee-keepers of New York are to be congratulated that at least *some* of the affected brood is not the dreaded foul brood."

Robber-Bees.—Editor Hutchinson says, in the Bee-Keepers' Review, there is no doubt bees can learn things, and they learn to follow the bee-keeper about the yard when he is opening hives. They also learn, when a bee enters the hive with booty, to start for the place where they have known sweets to have been exposed previously. One summer, when rearing queens, he put out daily a batch of honied cappings. The bees soon learned where to go, and within a few minutes after being taken out the can of cappings would be "roaring full" of bees. "They would grub away for an hour or more, and then gradually dwindle down to a few dozen. Even while they were at their busiest, I could go out in the apiary and open hives with no more trouble than usual." He very prop-

erly inveighs against the practice of shutting up a hive or carrying it into the cellar when robbers are found working at it, for being enraged at not finding what they expect they pounce upon adjoining colonies, whereas if they had been allowed to clean out the hive they were at they would gradually have quieted down without further trouble.

A Good Suggestion.

The past was not a good season in this locality for honey—only a half crop, and that dark and only fairly palatable. I have some very fine white clover honey two years old, which I find ready sale for at 15 cents per pound. Bee-keepers act unwisely by rushing their honey into market when honey is plentiful, and get low prices. Keep it in good condition for "off years," like the present, and get good prices, and keep up your trade.

ROBT. B. WOODWARD,

Perry Co., Ohio, Nov. 1.

Bee-Keeping in Nevada.

This has been a very poor year here for honey, most bee-keepers realizing a light crop, 24 sections per colony being a fair average. Prices were rather low, ranging from 8½ to 9½ cents, some choice white bringing 10 cents. I was more favored, having produced 60 pounds per colony, and I got 10 cents a pound for all of it. I also have the honor of having cased the finest lot of honey that was loaded at this point.

It is not necessary to say that the "Old Reliable" has been my authority, and will be so long as I can raise the "necessary" to procure it. When we can procure the experience of such able manipulators as Doolittle, the Dadants and others, at \$1 00 per year, I think it money wisely invested.

My bees are flying every day—not a case of robbing this fall—and they have gone into winter quarters in fine condition.

Some bee-keepers here take no paper at all, and do not want any, and I can see the "benefit" they derive, most of them not having produced enough honey this season to pay for supplies and smoker-fuel.

Reno Co., Nev., Nov. 4. J.S.O. W. LYELL.

He Had the "Tobacco Heart."

Mr. A. I. Root for years has been trying to get those addicted to the use of tobacco to give it up. On being informed that two who had done so had returned to the useless and harmful habit, he wrote the following for Gleanings in Bee-Culture:

I hope and pray that they may change their minds, and for the sake of health, if nothing more, give up the weed after all. Let me tell you a little story—something that happened right here on our premises, and you may tell the story to your two friends.

The man who files our saws, Mr. Albert A. Herkner, has been for many years in poor health. He consulted different doctors. One called it stone in the gall-bladder, or something like that; another, heart-disease, and I guess they did not know exactly what did ail him. He kept having his bad spells every little while for two or three years. Finally, some time in the summer, he had to give up work entirely, and it was talkt around among his friends that he probably never would do another day's work for The A. I. Root Co., or for anybody else, for that matter, in this world. We all felt sad about it, and a new saw-filer was installed. But he greatly needed a little instruction, especially in regard to using the saw-filing machine, by Mr. Herkner himself, and we accordingly askt Mr. H. if he

Langstroth on... The Honey-Bee

Revised by Dadant - 1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$2.00. But, as a **SPECIAL OFFER**, and only until next Jan. 1, we will mail this book for only 75 cents provided you send enough on your Bee Journal subscription to pay all arrearages and to the end of 1900. Those having already paid their Bee Journal subscription to the end of this year, need send only \$1.75 for the book and the Journal for 1900. This is a splendid chance to get a grand bee-book for a very little money.

ADDRESS,

George W. York & Co.

118 Michigan St., - CHICAGO, ILL.

LOTS OF EGGS MEANS LOTS OF MONEY.
 If you can double the eggs you double the money. Green Cut Bone is the only thing which will double the egg product. It is easily secured, easy to prepare and feed and is cheap.
MANN'S NEW BONE CUTTERS
 are the difference between profit and loss in the poultry business. Cut fine, fast and easy. Mann's Clover Cutters, Granite Crystal Grit and Swinging Feed Trays make the business profitable. Catalogue free. F. W. MANN CO., Box 7 MILFORD, MASS.

OUR MOTTO: WELL MANUFACTURED STOCK—QUICK SHIPMENTS.

Sections, Shipping-Cases and Bee-Keepers' Supplies

We make a specialty of making the very best Sections on the market. The BASSWOOD in this part of Wisconsin is acknowledged by all to be the best for making the ONE-PIECE HONEY-SECTIONS—selected, young and thrifty timber is used.

Bee-Keepers' Supplies

IN THE WORLD.

Parties wanting goods before new catalog is issued will please write for quotations. We want every BEE-KEEPER on our list.

If you did not receive our catalog last year send us your name and address and we will mail you our new catalog as soon as it is ready.

A PRACTICAL POULTRY BOOK

One which covers every detail of the industry from incubation to market is our 20th CENTURY CATALOGUE. It will teach you from the practical experience of others what it would take you ten years to learn. Among other things it tells about the latest improvements in the world famous Reliable Incubators and Brooders. Sent for 10c to pay postage. Reliable Inc. & Brdr. Co. Box B 2 Quincy, Ill.

Page & Lyon Mfg. Co.

NEW LONDON, WIS.,

Operates two Sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of ... **Bee-Keepers' Supplies,**

They have also one of the LARGEST FACTORIES and the latest and most improved machinery for the manufacture of Bee-Hives, Sections, &c., that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the clearest and whitest Basswood is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the BEST GOODS AT THE LOWEST PRICES.

Send for Circular and see the prices on a full line of Supplies.

24 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 24 cents a pound—CASH—for best yellow, upon its receipt. Now, if you want the money PROMPTLY, send us your beeswax. Impure wax not taken at any price. Address as follows, very plainly,

GEORGE W. YORK & CO., 118 MICHIGAN STREET, CHICAGO, ILL.

could not get down to the factory long enough to tell the new man something about the new work.

One day I was greatly surprised to see him on the street, looking fairly well. I stopt my buggy, and askt him to get in and ride. Then I began to ask him what doctor or what means had been used that he should be so much better. What do you think he said? Why, it is the old story. His last doctor was sensible enough to tell him that, in his opinion, it was the tobacco he used that was killing him, and that he would have to make his choice and do it soon—to go on with his tobacco, just as he was doing, and die, or give it up and live.

The doctor told him he had tobacco heart, and the announcement waked him up somewhat. He said if that was the case he would stop then and there and stop entirely. He did stop and gained so rapidly that in two or three days he was out on the street, and has been at work a good deal of the time for 10 hours a day for several weeks. He says he has a terrible fight with the old habit, but physically he is gaining strength every day. He seems glad to talk about it, and to tell his friends his experience, and has given me permission to tell it here in print.

A particular friend of mine, who takes care of my teeth, in speaking of Mr. Herkner's case, said he too had quit the use of tobacco in all shapes. He said he was getting to a point in life where he needed all the nerves there were to be had—that is, in order to do his difficult and intricate work as it ought to be done—and he had satisfied himself that tobacco saps the nerves of life more than any other one thing.

Well, there are several more right around here who are getting very rapidly to this very point, where it is a matter of life and death. No doctor can do anything for any man when tobacco is killing that man, unless he gives up its use; and our best physicians are asking their patients, "Which will you do—use tobacco, and die, or give it up and live?"

A. I. ROOT.

We never have been able to comprehend why any one who desires to be clean and healthy should want to use filthy tobacco in any form. Tobacco contains a poison, and must naturally, to a more or less extent, be injurious to those who indulge in its use. Better let it alone, and be both cleaner and healthier.

No Surplus Honey.

Cold days have commenced to make their appearance here. My bees are all in their winter quarters on the summer stands. Last winter I lost all but 3 colonies; not on account of the cold weather, but the snow-drifts would block up the entrances. The past season I increased the 3 to 8 colonies. Besides all the honey they gathered, I had to give them 55 pounds of sugar to supply them for the winter. Using all the honey for the bees I had not a bit left for myself. I hope to have better luck this winter, and wish the best success to the American Bee Journal.

CHAS. DUCLOS.

Saginaw Co., Mich., Nov. 6.

Common Elater or Spring Beetle.

PROF. A. J. COOK:—I mail you a queer insect, the name of which I cannot find. No one around here knows anything about it. I sent it to the office of the American Bee Journal, but Mr. York advised me to send it to you. When it was alive, and when taken between the thumb and finger, it would thump its head upon the table. It was not as black as now. It was found under the bark of an old tree.

De Kalb Co., Ill. JOSEPH MASON.

[The insect is one of the common Elater beetles. These are often called spring beetles, as when placed on their back they will spring up, often several inches, and strike on their feet. They do this by means of a peculiar spring-pole arrangement on the

underside of their thorax. They belong to the family Elateridae, of which there are many species in our country, which range from the Pacific to the Atlantic, and from Canada to the Gulf. The fire fly of Cuba also belongs to this family. Of course it should be "fire-beetle" and not "fire-fly." These beetles produce a large amount of light—enough, it is said, to light a room where there are enough of them. I have heard it said the ladies wear them in nets on their heads for this purpose. The grubs of some of these beetles are the so-called "wire-worms" which often do immense damage, eating off the roots of corn, grain and other plants. Here in Southern California they do immense damage in the alfalfa fields and in the deciduous fruit orchards. Some of the beetles are very large. The grubs feed on rotten wood. The grubs of one of these large beetles are often found in the decaying wood of apple-trees. The beetle of this species has large eye-like spots on its thorax, and is a very market insect. While some of the wire-worms are among our worst enemies, most of these beetles, I think, do little harm.—A. J. COOK.]

Convention Notices.

Minnesota.—The Minnesota Bee-Keepers' Association will hold its 11th annual meeting at the Court House in Minneapolis, Wednesday and Thursday, Dec. 6 and 7, 1899.

J. P. WEST, Pres., Hastings, Minn.
DR. L. D. LEONARD, Sec., Minneapolis.

Colorado.—That "irrepressible" Colorado State Bee-Keepers' Association will hold its annual convention Nov. 27, 28 and 29, in the State House, Denver, beginning at 10 a.m. As usual, the State Agricultural College will assist us. Every one should come loaded with ideas and subjects for discussion; those who cannot come should write soon to the secretary or the president and tell us what are the particular needs of your locality. The members will be the program—we know from experience that you will make a very lively convention. Come everybody—there is sure to be "a hot time in the old town."
R. C. AIKIN, Pres.,
F. KAUCHFUSS, Sec., Loveland, Colo.
box 378, Denver, Colo.

Columbia's Success.

We wish to let our friends know of our latest success. We took both first and second premiums at the Illinois State Fair, Springfield, Ill., Sept. 25 to 30, 1899; also first premium at Macoupin Co. Fair, Carlinville, Ill., Oct. 3 to 6, 1899. Our premium notification reads: "As a token of highest excellence and the best exhibit at the Fair."—H. C. CLARK, Sec'y. Columbia Incubator Co., Delaware City, Dela.

BEE-KEEPERS! Let me send you my 64-page CATALOG for 1899.
J. M. Jenkins, Wetumpka, Ala.

Please mention Bee Journal when writing.

Queen-Clipping Device Free....

The MONETTE Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. We mail it for 25 cents; or will send it FREE as a premium for sending us ONE NEW subscriber to the Bee Journal for a year at \$1.00; or for \$1.10 we will mail the Bee Journal one year and the Clipping Device. Address,
GEORGE W. YORK & COMPANY,
118 Michigan St., Chicago, Ill.

Bee-Keepers' Photograph.—We have now on hand a limited number of excellent photographs of prominent bee-keepers—a number of pictures on one card. The likeness of 49 of them are shown on one of the photographs, and 121 on the other. We will send them, postpaid, for 30 cts. a card, mailing from the 121 kind first; then after they are all gone, we will send the 49 kind. So those who order first will get the most "faces" for their money. Send orders to the Bee Journal office.

BEE=BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 50 cts.

Foul Brood Treatment, by Prof. F. R. Chessac.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohuke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Nov. 7.—There is a firm tone in all kinds of honey, even buckwheat sells easier than of yore, 16c is obtainable for the best white comb which we class as fancy, and 15c for No. 1 grade; stained and off grades of white, 13@14c; amber, 10@12c; and dark to buckwheat, 9@10c. Extracted white clover and basswood, 8@9c; amber, 7@8c; dark, 6@7c. Beeswax, 27c.
R. A. BURNETT & Co.

CINCINNATI, Nov. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8½c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth.

KANSAS CITY, Nov. 9.—We quote No. 1 white comb, 13½@14c; No. 2, 13@13½c; No. 1 amber, 13@13½c; No. 2, 12@13c. Extracted, white, 7½@8c; amber, 7@7½c; dark, 5½@6c. Beeswax, 26@27c.
C. C. CLEMONS & Co.

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7@7c to 75c gallon. Beeswax quiet at 26@27c. HILDRETH & SEGELKEN.

BUFFALO, Nov. 6.—Actual supplies in Buffalo are smallest for several seasons at this date. Strictly fancy 1-lb. comb, active, 15c; No. 1 and choice, 13@14c; dark, buckwheat, etc., 8@12c, as to grade. Beeswax, 27@28c. BATTERSON & Co.

SAN FRANCISCO, Oct. 25.—White comb, 11½@12½c; amber, 8@10c. Extracted, white, 7¼@7¾, light amber, 6½@7c; amber, 5@5½c. Beeswax, 26@27c.

BOSTON, Nov. 7.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

We are pleased to note that our market continues in splendid condition. While the supply is light, yet, owing to the high prices, it seems to be quite equal to the demand. Later on when the trade realizes the shortage more thoroly the demand undoubtedly will be much better.
BLAKE, SCOTT & LEE.

ALBANY, Nov. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c.
MACDOUGALL & Co.
Successors to Chas. McCulloch & Co.

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14@14½c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 8c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8½c. Beeswax, 23@24c.
M. H. HUNT & SON.

CLEVELAND, Oct. 18.—Fancy white, 16c; No. 1 white, 15c; fancy amber, 12@13c; No. 1 amber, 11@12c; fancy dark, 9@10c; White extracted, 8@8½c; amber, 7@7½c. A. B. WILLIAMS & Co.

WANTED.—Comb and extracted honey; state price, kind, and quantity.
R. A. BURNETT & CO.,
33A1st 163 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery.

CONTRIBUTED ARTICLES

An Apiary and Bee-Keeping in South Dakota.

BY JAMES M. HOBBS.

BEE-KEEPING in our new State is also a new industry. The illustration herewith represents my summer and winter home-apiary and this is the eighth year I have wintered my bees as shown in the picture, and with good results.

I work for comb honey only, and use 1½-story, 8-frame Langstroth hives.

The honey-flow this year was not as good as in previous years, as I got only about 45 pounds per colony on an average, fall count. Some colonies produced as high as 130 pounds of comb honey. We usually get 50 to 75 pounds on the average. Our principal flow is from sweet clover, which is abundant here; also alfalfa.

My method of increase of colonies is natural swarming. I have no clipped queens. I have practiced this method for 20 years, and I will say that I have had only *one* swarm to abscond in all that time, and for eight years no swarm has settled over four feet from the ground. I could sit in a chair and hive them. At some future time I will describe my method.

Yankton Co., S. Dak., Oct. 17.

Bee-Hive Ventilation During the Winter Months.

BY G. M. HOOLITTLE.

AS I am fixing the bee-hives these days (the forepart of November), as to the matter of covering over and around the frames, my mind chanced to wander over

the past, and trace the way in which I had been led up to where I am to-day as to the subject of ventilation of bee-hives, and in so thinking it came to me that it might not be amiss to tell the readers of the American Bee Journal something about it.

Among many pleasant recollections, the bees are ever foremost, and at 10 years of age I was an anxious watcher of these little creatures, of which father had from 20 to 40 colonies, according as the seasons were good or poor. These were kept in what was then known as the "Weeks patent hive," a hive which had the bottom-board attached to it with wire hooks and staples, and with a button so arranged that, for winter, the bottom was allowed to hang suspended an inch below the hive, while in summer the button was so turned as to bring the bottom-board tight to the bottom of the hive, except the entrance. With this hive father had poor success wintering bees, while a neighbor wintered his safely with a hive closed tight at the bottom and a two-inch auger-hole at the top. This success of the neighbor, and father's poor success, caused him to fasten the bottom-boards of the Weeks hive in winter, or rather leave them during the winter just as they were in summer, while the holes in the top, thru which the bees had access to the surplus apartment, were opened, and the surplus chamber was filled with some old garments, carpets, hay or straw, or something of the kind, just what came most handy. Fixt in this way we had very little trouble in wintering the bees thereafter.

The recollection of this matter caused me to believe that "upward ventilation," as it is often termed, was the proper kind of ventilation to give, when the bees were wintered on the summer stands.

Soon after this, nearly all the bees in these parts died of that dread disease, foul brood, and no more were kept in the family until the year 1869, when I purchased two colonies, thus laying the foundation of my present apiary.

At that time (1869) there were plenty of bees kept all about here in box-hives, very many of which were raised on half-inch blocks at the bottom all around, that being something similar to the old method of ventilation of the Weeks

Home-Apiary of Mr. James M. Hobbs, of Yankton Co., South Dakota.

hive, and quite nearly representing the rim one inch deep recommended by some of the writers of a decade or so ago. But I adopted the plan of "upward ventilation," as it was then termed, altho I now look at it as practically no ventilation at all, in the sense of a draft of air, unless we can call it ventilation which we enjoy when sleeping under our warm comforters on a cold winter's night.

Soon after I commenced to use this upward-ventilation plan, as it was termed, there came a series of winters in which the box-hive men lost all the bees they had, while I met with scarcely any loss, and the bees in the woods seemed to be as numerous as ever. This set me to studying again, and by looking at the bees in their natural home in the hollow tree, I found that the hollow was composed of partly decayed wood, especially above the combs. Thus, in winter, the moisture from the bees passes into the decayed wood which surrounds them, and is expelled each summer by the heat. In this we had something pointing toward the porous covering which many of our best apiarists have used for years with such good success, and also toward the chaff hives used of late years with equally good success. With these chaff hives, and the slow change of air taking place thru the chaff or sawdust cushions, we have something even better than the home Nature provided for the bee; and with hives so arranged there need be very little provision for ventilation at the bottom, for, should the entrance become obstructed with snow, ice, or dead bees, so that all air is cut off from the bottom, the bees can secure all the ventilation they require thru the chaff sides and cushion from above, thus passing nicely along until a warm spell occurs, when they can clear their doorway.

After years of experience with chaff hives, used in connection with sawdust cushions over the top of the brood-chamber, I have become convinced that there is nothing better along the line of hives for wintering bees on the summer stands than this, and I would hereby ask every reader of the American Bee Journal who is at all skeptical on this point to prepare ten colonies in chaff hives with sawdust cushions as above, taking ten others as nearly like them as possible (except that they be left in ordinary hives with lower ventilation), and see if all skepticism does not vanish at the end of three or four years. I even use these chaff hives with sawdust cushions to quite an extent for cellar-wintering, and think that they have an advantage even there.

In connection with ventilation thru porous covering, some think that, as all the moisture is carried off, the bees need water given them to keep them in a healthy condition; but I feel that such is wholly unnecessary, for the reason that I believe it a bad plan for the bees to breed much if any before the middle of March to the middle of April, according to the season and the locality, and bees need no water in the winter season except for breeding purposes. Colonies which commence breeding to any great extent earlier than this are not as good, as a rule, on the first of June as those of the same strength as to number of bees that do not commence to rear brood before the first of April.

To avoid too early brood-rearing it is a great help where they are packed in chaff along this line; for the sun's rays will not arouse the bees to activity, such activity causing brood-rearing every time it shines on them for a little while during the middle of the day when the air is cool otherwise. This early breeding causes a much greater consumption of honey and a far greater loss of bees without a corresponding benefit. When it comes steady warm weather two bees are reared for one old one lost, while in early spring or late winter two old bees are lost to where one young bee is reared; hence anything that causes early breeding becomes a loss to us both in bees and in stores.

Only as we look after all of these items which have a direct bearing on our pursuit, can we expect to become the most efficient in our calling in life.

Onondaga Co., N. Y.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the new bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 726.]

Mr. G. M. Doolittle, of New York, then delivered the following address on

The Possibilities of Bee-Keeping.

There are some who think we have arrived at all the possibilities of bee-keeping, but I do not think so. I am going to prepare what I have to say by reading to you out of God's Holy Word. I will read from the book of Revelation, the 1st chapter, from the 9th to the 19th verse; also from the 3rd chapter, 7th to 13th verse. I am not going to preach a sermon to you to-night, but as something to guide our thoughts I desire to take a text of three words found in the 8th verse of the 3rd chapter—"A little strength."

As John goes back in thought he sees the Son of Man stilling the waves, healing the sick and raising the dead. He now sees more power in Him than when on earth, and as he sees the power he hears Him saying, "Behold, I have set before thee an open door because thou hast a little strength." Of course, this was meant in a spiritual sense, but I do not think I shall be much out of place if I apply it to bee-keeping. *All power comes from God*, and we could not keep bees without that power.

I am reminded of a Scotch girl. There was a high mountainous pass where occasionally a man went down. This girl was imprest to build a bridge over it. She went out among the people, and the result was that a bridge was built. The people were so rejoiced that they wanted to name it after her; but she said, "No! If you must name it, call it 'God and Us.' God gave the power and we carried out His purpose." In this nation, whence comes all this power? We see railroads and electric cars going in all directions; the telegraph, telephone, etc. Whence came the power that brought these about? Does such power come to heathen nations? *No!* it comes from God to Christian nations.

Now, bring it down to the bee; if we have "a little strength" to grasp that idea, "God with us," there is set before us "an open door," and we can accomplish much with the bee. If I have a *little* strength the promise is to *me*. Do I wish to be a Dr. Miller, Mason, Root, Hutchinson, Elwood? The "little strength," with "the open door," may enable me to equal if not excel them.

There is a story of a little boy who saw some apples, but they were out of his reach. A little further on he saw a larger boy, but *he* could not quite reach them; so the smaller boy climbed upon his shoulders, and then he could reach them. "If at first you don't succeed, try, try again." A large block of granite was put up for sale one day. Michael Angelo was at the sale. He thought he would buy it. It sold for an enormous sum, but Angelo took it. Some one asked him, "Why did you pay so much?" His reply was, "I saw an angel in the block, and I am going to liberate it." He did so, and became famous for "the angel" in statuary.

Have you tried to understand your locality, and failed? If you do not understand your locality you fail of the best success. When you see your bees coming in with pollen in the spring, follow the bees. Then when a load of honey comes in follow it to its source. The bee-keeper must follow his pursuit to perfection. I told the following story at the National convention in Canada:

Henry Clay wanted the presidency. He came to an old friend and said to him, "Are you going to help me now?" The answer was, "No; you failed *me* once."

Clay saw he was not going to make anything by that, so he said, "John, do you remember the old days?" John said, "Yes." "Do you remember the old gun?" "Yes." (It was an old flintlock.) "Did the gun ever fail you, John?" "Yes, it failed me once when I needed it most." "What did you do? Throw it away?" "No, I pickt the

flint and tried again." "Can you not try *me* again, John?" "Yes, I will pick the flint and try you again." We must pick the flint and try again if we fail.

Do we want strong colonies with no swarming and much comb honey? There are those here who do not believe we can have strong colonies and much honey without swarming. I believe we shall yet have these things because some have "a little strength" to work in that direction. Now, there is no such thing as failure, if we have "a little strength," because there is set before us "an open door."

I love to read Jeremiah, in the 18th chapter. When he was about to get discouraged God sent him down to the potter's house. He saw the potter molding the clay, and just as the potter had it all molded it dropt and went all to pieces. Jeremiah thought it was ruined, but the potter gathered up the pieces of clay and molded it again into a perfect vessel fit for the Master's use. Have you tried rearing queens and failed? What are you going to do? Are you going to give it up? The queen that cannot be "brought to time" in breeding is not the queen for me. I have been working to bring queens to perfection by giving the maximum number of bees just at the time of the honey harvest.

I am requested to tell the anecdote I told at the Buffalo convention of this association two years ago. A certain darkey often went to market, but one time it was different—his wife went with him this time. He cried at the top of his voice, "TATOES, TATOES, TATOES!" His wife said, "Keep still, darling, you will wake all the people up." He said to her, "That is what I want to do;" and again he cried, "TATOES, TATOES, TATOES!" That is what *we* want to do—wake bee-keepers up about securing a large force of bees in time for the harvest.

Do you wish to know about putting on and taking off sections, doing it at just the right time? Then use "a little strength" along that line.

When we entered the bee-keeping ranks we pledged ourselves by thus entering to do our best. Some may not believe we did so. I am reminded of our great ocean steamers. In the middle of the Atlantic one of the stokers was asked, "Are the other stokers all working? Is the vessel going right?" He answered, "I am not the captain, but by taking this place I pledged myself to do the best I could. I am captain of this shovel." He did his part faithfully, and the vessel landed safely in Liverpool.

Have you tried wintering bees and failed? During the winter of 1881-82 three-fourths of all the bees in the United States died. There has been progress in wintering since then, and yet we are not perfect. August is the time to prepare bees for winter. See that each colony has a good queen, bees and food enough. If you wait until December, and then write to Dr. Miller or Dr. Mason about preparing your bees for winter, you will be something like the old preacher whose wife said to him one cold Sunday, "Had you not better put on a thicker pair of pants?" The pair he put on had hung away all summer in the attic, and the wasps had built a nest in the roomy part of them. After getting into the pulpit he commenced to read the 103rd Psalm: "Bless the Lord oh my soul—oh, what a sting! 'Bless the Lord oh my soul, and forget not all his benefits'—Ge-whit-aker, what a sting! I'll tell you what it is, brethren, the word of the Lord is in my mouth, but the devil's in these breeches."

If we put off preparing for winter until December the word of the Lord may be in our mouths, but failure will be ours. There is no time for sitting around listening to idle gossip.

A sailing vessel was stranded off the coast of South America; a signal of distress was run up, and a steamer saw it and asked what was needed. "Water, *fresh water*," was the reply. "Do you not know you are at the mouth of the Amazon? Let down your buckets and you will find plenty." My friends, we are always in the Amazon of bee-keeping; let down your buckets and dip the fresh water up.

Moses saw the burning bush and put his shoes from off his feet. There are many burning bushes about the bee-keeping pursuit, but he only sees who "puts the shoes from off his feet." After seeing the possibilities we are to go out and tell it to the world, for there are no possibilities in selfishness.

Biddy said to Pat one morning, "Go and kill the rooster." He came to the door with it under his arm, took it by the head, gave it a few twists, and sent it floundering into the kitchen with the blood spurting about.

"Pat, didn't I tell you to kill the rooster?" yelled Biddy. "Faith," said Pat, "it's dead, but it don't know it." The selfish person may go floundering about, but is

dead to the possibilities of apiculture. The first thing for us to do after learning something useful is to go out and tell it to the world. There are no possibilities of a useful thing dying with ourselves because *we* only wish to profit by it. We are to spend ourselves for others if we would attain to the highest possibilities, as such expending will react on us.

You remember the old metaphor,

"There was a man, his neighbors thought him mad,
The more he gave away the more he had."

And so it is with us, if we try to make the apicultural world better for our having lived in it. The Good Book says, "There is that scattereth and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to poverty."

Every time we tell a thing the possibilities are greater thru the reflex action that comes to us, and so by thus telling we keep on growing to the *highest* possibilities.

It is said that Capt. Cook, when he sailed around the world, planted English flowers at every place he landed, and so he has, thru these flowers, been growing ever since.

No, no, brothers and sisters, bee-keeping is not ours. We may think we have the right to hug things up and keep them ourselves, but it is not so. Apiculture of to-day is what it is because of those who came before us.

Two monkeys discover an apple below a high bank in the water, with the limb of a tree overhanging. They climb the tree; the first attaches himself to the limb, and the second attaches himself to the first monkey, but they are too short. A third came, but still they could not reach it. Along came the fourth, and taking in the situation ran up the tree, over the limb, and down the three suspended monkeys and reached the apple. Will any bee-keeper present tell me that the apple belonged to the fourth monkey? The apiarists of the past are the "mother breasts" that furnish the nourishment for the possibilities of the present. The thought of yesterday is but the inspiration of to-day. He only lives *wisely* who lives for the possibilities of the future—possibilities to generations yet unborn. Others of us instead of being selfish are telling things that we don't know; we get a little bee-keeping—go out and write for the papers and make lots of noise.

An old darkey was plodding and splashing homeward thru a midnight thunderstorm. The winds were blowing, and the rain was sheeting down. Every other moment a flash of lightning slashd the heavens briefly like a knife of fire. Then followed the thunders, rolling crash on crash, as if the very roots of the hills were being torn from their home in the ages. The lightning would last but a second, and then leave the poor old darkey in blacker night than ever. But the thunders were incessant; their rollings were without end. At last the old darkey became frightened, and, following a thundrous peal of unusual horror, he plumped down on his knees in the mud and began to pray, "Oh! Lord," he cried, "far be it from one so humble as I to tell Thee thy business. But if it's all the same to Thee, an' don't pester Thee or change too much Thy infinite plans, couldn't this storm be managed to give us a leetle less noise an' a leetle mo' light? Amen!"

And so let us, when we do anything, do it for the purpose of disseminating light, not to make a noise.

Again, others of us work with no definite object in view. We should work and toil for a purpose. John Chinaman was hacking away on a stick, and a neighbor asked him, "What are you making, John?" He replied, "It may be a god or it may be a bedstead, for all I know." We experiment so loosely that, at the finish, if asked the result, we can only reply, "It may be a god or it may be a bedstead, for all I know." Let us work so perfectly that we *know* what we are doing, so that we may hear the Master say, "Because thou hast 'a little strength' I have set before thee 'an open door.'"

Mind has not grasped the possibilities which are before us if we work with the "little strength" we have. Let us not deceive ourselves. This "little strength" must be used intelligently, and for the good of the whole not for just *me*, if "behold, I have set before thee an open door" of possibilities is to be realized. Understanding it, are you ready to venture? If so, the *possibilities* are for you. There is no chance of a failure. The *power* is with our "little strength." The accomplishments of the past are nothing to what there is in store for the apicultural world if we but enter the "open door." Will we do it?

A certain explorer, with his guide, was traveling up the Alps. They came to a certain place where the explorer could see no place to stop. The guide swung himself into a crevice of the rock and put out his hand; seeing it the ex-

plorer said, "If the hand fail I fall into the abyss below. Not to go forward will lose to me the sights for which I came." Assuringly the guide said, "That hand never lost a man."

I fear I have not made this as plain as I might. I have tried, but fear I have failed thru my inability to express myself, but to him that hath "a little strength," the Master saith, "He that shutteth and no man openeth, and He that openeth and no man shutteth," "because thou hast "a little strength, behold I have set before thee an open door, and no man can shut it."

In conclusion, allow me to say that that hand—that all-powerful hand of the Master—coupled with our hands having a little apicultural strength "that hand never lost a man!"

G. M. DOOLITTLE.

Following the address by Mr. Doolittle, Prof. H. W. Wiley, chief chemist for the United States Department of Agriculture, Washington, D. C., spoke as follows on

Food Value of Honey—Its Adulteration and Analyses.

A great poet, as well as one who had a keen insight into the scientific laws of nature, said, about one hundred years ago, in language which I shall venture to translate—

"He who knows not all that has happened
In three thousand years, will never
See the light nor have experience
Even should he live forever."

This statement of Goethe is true, also, in matters connected with honey.

It seems to me, therefore, in discussing the subject of honey as a food, that it would be wise to go back over the pages of history and see what uses were made of this substance during the past three thousand years, or even longer. If you will indulge me, therefore, I will preface what I have to say by a few extracts taken from historical pages, relating to honey and its uses. We ought to know what has been done in three thousand years, but I do not propose to take three thousand minutes to tell you.

EARLY HISTORY.—The tribes of men that live solely, or almost so, on flesh use neither salt nor sweets. The transition from flesh-eating to plant-eating in the early history of all nations is attended with the consumption of salt and sweets. The word sweet is common to all dominant languages. In Sanscrit it first occurs, thousands of years old, as *svadu*, to make sweet; ydus, Greek; *snovis*, Latin, etc. The use of honey in early historical times was connected with religious rites, chiefly because the fermented honey-water was supposed to contain a spirit powerful, and needing to be propitiated.

Wine or beer made from honey was known in the earliest historical times, known in Sanskrit as *madhn*, and in Greek as *meu*, and in German as *meth*.

Bee-culture was unknown to many early nations which valued wild honey. It is evident that Homer would have mentioned bee-culture had it been known to the Greeks in his time. Homer frequently mentions honey and its uses, but never suggests that men have anything to do with its production. Homer, in the 9th book of the *Odyssey*, calls wine the "the red honey of the grape." A "land full of honey" to the ancient writers did not mean the ideal land full of milk and honey, but a wilderness where the bees work undisturbed in accumulating their stores.

While some attempts were made before the Christian era to increase the production of honey by man's aid, no true system of bee-culture can be said to have existed 2,000 years ago. This is plainly evident from a perusal of that book of the Georgics devoted by Virgil to bees and honey. During Pliny's life (died 79, A. D.) men learned to build rude hives, and even placed in them windows of isinglass in order to watch the bees at their work. Pliny had some remarkable ideas in regard to the propagation of bees. He states that if the carcasses of young steers be covered with dung, Nature will change a portion of the steer's body into bees. (Book XI.) This idea probably arose from the fable of Aristous, the first bee-keeper who helped to compass the death of Eurydice. He was punished for this by having taken from him all his bees. He was advised by Proteus to supplicate the gods in a sacrifice of bullocks. He was delighted to see arise from their carcasses a new supply of bees.

Aristotle, who lived 350 years B. C., states that the bees make the wax, but gather the honey from Heaven dew. Even up to the time of Virgil, and after, the ancient writers had no notion of the existence of sugar in flowers, but the honey gathered by the bees was supposed to be a

direct gift of Heaven, or, as Virgil describes it, "That gift of Heaven, ethereal honey."

The use of honey in baking is mentioned in the 7th century B. C. At the time of Aristophanes the use of honey in the bakeries of Athens was quite common. (444 B. C.) The Athenian honey was very costly. Aristophanes says, "I beg thee, friend, use some other honey, spare the Attic which costs four crowns."

Xenophon mentions a poisonous honey which made many of his soldiers ill. Investigations in late years, of honeys produced in the locality described by Xenophon, show that this poisonous principle is derived from the Jimson-weed (*Datura stramonium*), of whose flowers the bees are very fond.

In Rome in the earliest times honey was very costly, and it was used only in religious ceremonies and as a medicine. It was supposed to have valuable healing powers. It was only about 170 B. C. that it became cheap enough to be used in baking.

In Caesar's time honey was used to a considerable extent. Vejanus, a bee-keeper near Falerimer, is said by Varro to have sold annually 10,000 sesterces worth (\$650) of honey from a flower-garden of about one acre in extent. His bees probably poached on his neighbors' preserves.

During the empire, honey merchants and bakers were found in all parts of Rome, and poultry intended for the rich were fattened on honey and ground cereals.

During this period, also, the preservation of fruits in honey was first practiced, and the foundations of a great modern industry laid. The preserving power of honey, however, was not discovered by the Romans, for Herodotus, who lived nearly 500 B. C., says that dead bodies in Eastern countries were preserved from decay by honey and wax.

It is said that the body of Agesipolis, king of Sparta, was preserved and sent home in this manner.

The Egyptians fed their sacred animals, *c. g.*, the crocodile, goose-flesh and honey-cakes, and pictures more than 4,000 years old of bees have been found in Egyptian antiquities. It seems probable, therefore, that the Egyptians were the first to gather honey.

Especially as a medicine honey was largely used in Egypt. In an old Egyptian writing, at least 1500 B. C., have been found numerous recipes for remedies in which honey plays the most important part.

Hippocrates, the celebrated Grecian physician, who lived 450 B. C., describes many remedies in which honey was the chief ingredient, and ascribed to it remarkable curative properties. An ancient fable recites that in thankfulness the bees constructed a hive on his grave, and that honey of miraculous healing properties was produced therein.

Democritus, who was contemporary with Hippocrates, and who lived to be more than a hundred years old, when asked how to attain so green an old age, replied, "Honey within, oil without."

Many curious theories were developed in respect of the curative powers of honey and wine—not perhaps any more absurd than many of the so-called medical theories in vogue at the present time.

Macrobius, 400 A. D., explained the healing power of the mixture by saying that the old wine by reason of its moist nature was warming, while the honey, by reason of its dry nature, was cooling. Pliny, on the other hand, ascribed the good effects to the property of honey which prevents decay.

The early Christian era saw a great impulse given to the production of honey. The souls of the dead were represented as flying to Heaven in the form of bees. Honey became of more general use, and the wax was made into candles for religious uses. The discovery of paraffine has rendered less effective the old Christian legend that God blest the bees as they were sent from Paradise, and that as a consequence no mass should be said without beeswax candles.

Bee-culture spread with great rapidity over Europe during the first millennium of the Christian era. In Spain honey became an article of export in the early centuries. The tithes of the church were paid in honey in many places. In Saxony honey and honey-bees were so abundant that a fire in Messina was extinguished with honey-bees in 1015. Nuremberg, however, seems to have been the chief center of the German bee-industry. In Russia, Poland and Lithuania immense quantities of honey were produced at this time. A king of one of the Russian provinces was said to have given to the poor honey and honey-wine, while he himself lived on mare's milk.

In the old Indian writings honey is frequently mentioned. The new-born child was welcomed with a religious ceremonial in which honey was the chief material em-

ployed, and the first artificial food of the infant was composed of honey and sourmilk.

In taking honey from a hive the sacred books of the far East prescribed great care, in order that the hive be not injured. The wanton destruction of a hive was regarded as a heinous sin, and one of the 88,000 hells which are conveniently provided in the theology of Brahma and Buddha was set aside especially for sinners of that class.

The cultivation of the sugar-cane, which became generally known at the time of the Crusades, and the discovery of beet-sugar, 150 years ago, have made artificial sweets so cheap that bee-culture no longer, as it did in the middle centuries, controls the market for sweets, and few bee-hives are now found in the European countries where they were abundant 1,000 or 500 years ago.

When we regard honey as food, of course we recognize that it occupies the same position as sugar or any other soluble carbohydrate.

I have been much interested in what I have heard to-night about honey as a food, especially in the comparisons made between honey and butter. I have not time to give the analyses of honey in comparison with other food, as I had intended. While honey may supply the place of starch or

—From Gleanings in Bee-Culture.

Prof. H. W. Wiley.

butter in the animal economy, it cannot supply the place of protein. Therefore, honey and meat cannot be compared as articles of diet, since they belong to entirely different classes of foods. Man can live by bread alone, altho the Good Book says he cannot.

Honey can supply heat and support energy, but it cannot nourish tissues containing nitrogen, without the help of some other kinds of nourishment, as, for instance, eggs, beans, lean meat, milk and bread.

It is very properly said that honey is one of the most easily digested foods of any class. If we eat starch it must first be converted into sugar before it undergoes the final processes of digestion. While starch is just as nourishing as honey, it must first undergo this preliminary fermentation before it becomes useful as a food.

A soldier must have something to eat on the march, something concentrated and quickly assimilable. While he is not nourished by sugar alone, yet sugar or honey furnishes a condensed emergency ration of the greatest value.

Among rice-eating nations, the Chinese and Japanese, for instance, can endure long working hours without fatigue. This shows that a food very rich in carbohydrate can support muscular vigor.

The pusher of the jinriksha will go longer distances than many a flesh-eating laborer could possibly cover. Rice

is a nourishing food, because it supplies carbohydrates. Honey is a food of a similar kind.

I will admit that to many people honey is a luxury. We can buy sugar that contains no water for five cents a pound. Honey contains water—we do not care to pay for water, which is not regarded as a food of commercial importance. Sugar has made sweets so cheap that honey is not in so great demand as formerly, and yet honey is so cheap that it can no longer be regarded as a luxury.

When I was a young man, and trying to get a little education, I was anxious to get into Switzerland, not so much to get learning, but to get honey. But what I got there was American glucose. I didn't see a bee-hive while there. If you have a variety of bees that can make honey out of snow, take them to Switzerland; they would find there an inexhaustible supply of the raw material.

It is surprising what a rich country we have—what an amount of luxuries we have! Most of us can afford to have honey for breakfast, and we would all be healthier if we would eat more honey and less meat at our matutinal meals.

It is a rare thing to find honey on a hotel table, and if you do, it's glucose!

I will dwell only a few minutes on the third part of my subject, and that is the adulteration of honey. I can add nothing to the remarks that have been made on this subject, but it is an important one. If we could stop the adulterations there would be no trouble in getting a good price for our honey, and people would eat far greater quantities of it did they feel certain that it was genuine.

I do not believe in prohibition of any kind. I believe in man being a free moral agent. If Mary Walker wants to wear trousers, let her wear them. Some one in the Good Book said, "If meat make my brother to offend, I will eat no flesh while the world standeth." I would not go so far as that, but if we are to be total abstainers it should be voluntarily, and not at the mandate of the law. We all have the same rights in what we should wear, eat and drink.

Butter has no more right in the market than oleomargarine, but oleomargarine has no right on the market as butter. If I were going on a distant journey I would take oleomargarine, for it is harder than butter, and would keep better. But when I buy butter I don't want to buy oleomargarine. When I buy honey I don't want to buy glucose.

I have heard speeches against food adulterations that have done more harm than good, because of their intemperate statements. I was once asked, "What is the extent of the adulterations of food?" I answered, "It is difficult to give the exact figures, but I think at some time or other, and in some country or other, about 90 percent of all human foods have been adulterated. But the actual existing amount of adulteration is probably less than five percent." Well, the newspapers reported that Dr. Wiley had stated that 90 percent of all foods on the market were adulterated. Well, that alleged statement was "sweeter than honey" to Germany and France. It was copied in all the trade and agrarian journals of those countries as a reason for excluding American food products from their markets. On any other subject extravagant statements do more harm than good.

I hope to see the day when we shall have a national law and State laws, regulating the manufacture and sale of adulterated foods; when concealed adulterations of food products will be a criminal offence, and the "little strength" we have now in that direction be grown into a national power, protecting industry and securing honest markets for its fruits. In the present condition of affairs one cannot be certain of the composition of the many attractive dishes a well-spread table offers him. He hesitates before partaking of the feast, no matter how tempting the scene may be. The one question he propounds to himself has been well put by the poet who pertinently asks—

"I WONDER WHAT'S IN IT."

We sit at a table delightfully spread,
And teeming with good things to eat,
And daintily finger the cream-tinted bread
Just needing to make it complete
A film of the butter so yellow and sweet,
Well suited to make every minute
A dream of delight; and yet, while we eat,
We cannot help asking, "What's in it?"

O maybe this bread contains alum and chalk,
Or sawdust chopt up very fine;
Or gypsum in powder, about which they talk,
Terra alba just out of the mine.
And our faith in this butter is apt to be weak,

For we haven't a good place to pin it,
Annatto's so yellow and beef fat so sleek—
O I wish I could know what is in it.

Ah! be certain you know what is in it,
'Tis a question in place every minute,
Oh! how happy I'd be could only I see,
With certainty, all that is in it.

The pepper, perhaps, contains cocoanut shells,
And the mustard is cotton-seed meal;
The coffee, in sooth, of baked chicory smells,
And the terrapin tastes like roast veal.
The wine which you drink never heard of a grape,
But of tannin and coal-tar is made,
And you could not be certain, except for their shape,
That the eggs by a chicken were laid.
And the salad which bears such an innocent look,
And whispers of fields that are green,
Is covered with germs, each armed with a hook
To grapple with liver and spleen.
No matter how tired, and hungry, and dry;
The banquet how fine: don't begin it
Till you think of the past, and the future, and sigh.
"O I wonder, I wonder what's in it."

And the preacher who prates of the glory that waits
On the saints, and asks, "Have you seen it?"
And tells you how hot it will be for the sot
And the sinner, at last—does he mean it?
The political boss, who asks for your vote,
And promises not to forget it,
When landed at last in a place of some note,
Don't you think you'll surely regret it?
And the maid of your choice, with the heavenly voice,
Whom you've loved for a month, if not longer,
Perhaps has said "Yes," and it's time to rejoice,
And foster the faith that grows stronger.
But that true heart, so dear, O you tremble with fear,
And doubt when you struggle to win it;
And now that it's yours, I beg do not jeer.
When I ask, "Are you certain what's in it?"

H. W. WILEY.

The convention then adjourned until 9:30 a.m. the next day.

[Continued next week.]

The "Old Kibbale" seen thru New and Unreliable Glasses.

By E. E. HASTY, Richards, Ohio.

PURE-FOOD LEGISLATION.

A grandly notable paper deeply concerning all mankind, and on a subject outranked by very few possible topics, is E. T. Abbott's paper on pure-food legislation. Even if it isn't quite true that it outranks "expansion" and "currency," that indication of the writer's enthusiasm can easily be forgiven. No harm to remember, however, that legislation on expansion and currency is practically self-enforcing in most cases, while the best imaginable pure-food law safely on the books would only be one short step. Enforcement would be the long step. All honor to Mr. Abbott for his right stand for the principle—"benefits for all," and no sly favors or tricks. Our own people have not been in the past quite clear-skirted of tricks. To get legislative bodies to pass what seemed to be a pure-food law, but which would turn out to be a law to prevent selling under its own name, or even producing sugar-honey, was a trick in high repute during the sugar-honey flurry. (Page 660.)

MR. THEILMANN AND THE DICKEL THEORY.

In Comrade Theilmann's experiments, page 643, where he continually gets a few drones hard to account for, there is another explanation possible besides the one he is steering for. It may be that queens often lay an unfecundated egg (machine drops stitches) in ordinary laying, and that these are seldom noticed because usually the bees leave them to perish instead of developing them. If the bees can

develop one sex just as well as the other of the same egg, then the *proportion* of 20 drones to 2,500 workers looks curious for a case where drones are earnestly desired. It would look more like it to see 500 drones or more.

MR. PETTIT'S APIARY.

Mr. Pettit's apiary, which opens out No. 41, looks like business—business first and beauty second—not business first and beauty never thought of, as some apiaries appear. It evidently belongs to the close-order class of apiaries—worrisome to the whim of groupists and open-door folks, who shiver when they contemplate the chance of a young queen's getting bewildered and lost. But Mr. P. and his clan would shiver the rather at walking a quarter-mile with a load when a few rods would answer as well.

A KINK IN RETAILING HONEY.

About the very important matter of working up a retail line, Judge Terral, of the Central Texas convention, offers an unusual suggestion—still I guess he's right. Don't seek to sell a very large lot to one customer the first time you go round. They'll eat too much, get sick of honey, the unattractive remnant with flies and things in it will lie round time out of mind (just like any other unattractive remnant), and they'll never buy of you again, because, forsooth, they "have some honey." (Page 644.)

WHITE COMB FROM DARK HONEY.

Mr. Aten is not to be wondered at for the indignation with which he denies that ill-tasting, black-insect secretion can be elaborated into delicate white comb, beautifully capt. One would think not, indeed; yet he is almost certainly wrong. Sorry. If he was only right, the scamps who spoil markets by pushing off such stuff would have less success. (Page 645.)

THE TRAP OF APICULTURE.

McLennan's apiary is also one of the close-order kind, but seems to have alternated colors to help bees and queens locate home—good thing as far as it goes. Wonder what it is he's got on the top of so many of the hives—clamped sections all ready to go on, I guess. Captivating story, the way he was captivated and forced to be a bee-keeper. Apiculture is a trap, and man he's a mouse; if he don't want to be caught he'd best not monkey round much.

FALL FEEDING OF BEES.

I guess we can get pretty general agreement upon the saying of C. P. Dadant, page 658, that in the matter of colonies short of stores in the fall, the worst policy of all is to feed stingily, and have them starve to death, after all. And I would add this much further: With good stores of their own collection, and left entirely alone, bees will sometimes squeeze thru alive with not more than five or six pounds. Feed them two or three pounds more, and keep them in a flurry a week or so doing it, and I presume the result would be less live colonies in the spring. Good idea of his about atmospheric feeders. First invert them over a pan till all that will readily run out has flowed, then put them over the bees.

FREE BOARD AND MUSKMELON HONEY.

That was a remarkable offer Pres. Whitecomb tells of, page 659—free board to the apiarist that would bring his apiary to the melon-fields—but let us see, let us see! Columbus and Joliet have offers out not dissimilar in that one respect. With muskmelons raised by the square mile we ought to be told just what sort of honey muskmelon honey is. I thirst to know.

THE WICKED ADULTERATORS.

And so the adulterators themselves spread the idea that nearly all honey is adulterated, the same (and for the same reason) that "green goods" men spread the report that nearly all paper money is counterfeit. Page 659.

NEAR HIVE-ENTRANCES AND QUEENS.

"No danger of losing a young queen when two hives have entrances six inches apart, if there are *on/v* two." (Dr. Miller, 662.) I would have hesitated to put it quite as strong as that; but maybe it's right. You know when a young queen comes home, the bees (it has been said) sometimes incline to worry her a little. Might she not in the excitement of the occasion pull away, take wing again, and so get on the wrong door-step, finally?

SECTION-CLEANING MACHINES "REST IN PEACE."

Yes, yes, those section-cleaning machines our Boss inquires after in editorial note, page 664! Where are they, indeed? The racket they made was like unto the racket of

a chari-yari—and lasted about as long. Well, perhaps the lapboard and queer old knife that have done service so long constitute, after all, a very fair section-cleaning machine.

THE WHOLE-HOGGISH COMMISSION MAN.

Sometimes it's best to throw an old, soiled blanket over repulsive phases of human nature, and just say nothing would be inclined on some account to do so for that commission man on page 664, but the quiet, confirmed, cheerful, business whole-hoggishness with which he makes a forced sale of two barrels of honey at two cents a pound is bringing sadness into too many humble and worthy homes. What does he care? He's all right, as long as the two cents covers commission and expenses. Guess we had better blow a trumpet before him, and keep blowing it till even his brazen cheek begins to blush.

QUEENS BRED FOR BUSINESS.

O yes, breed queens for business rather than for color. Page 666. (Some may have heard that remark casually dropt before.) But if the breeders ever do, it will be a hard time for those little George Washingtons who cannot tell a lie—hard, anyhow, for those Jim Need-Washingtons who don't like to have lies told to 'em. On the whole, it's rather nice for a man to be able to see at once that he has got just what he sent for; and these wise mentors would rob us of this bliss.

A TRIPLET OF AFTERTHINKS.

Dr. Miller's dozen cages of discarded old queens, lying in a pile out in the shade, bathed in a volunteer ladies' aid society, for instance—and swarming and going back to the cages again once or twice every day, is unique enough to make a fellow smile (and think) if he is not too much bored. Page 667.

I like the temper of Mr. Bownds, page 669, who tells of the bad queens he reared for his own use, and then adds, "What's the matter with me?" Rather more Christian-like than flinging too-angry pot-hooks at somebody else.

Hold on, Mr. Prankard! We won't believe fish-story, too, if you don't quit telling us that every queen is where she ought to be, in that beautiful Herman apiary. Page 669.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

A Beginner's Questions.

1. How do you tell whether or not the hive is full of honey?
2. When do you take out the honey?
3. Do you take out all the honey at once?
4. Suppose one starts with 14 or 15 colonies of bees, must there be a queen in each hive?
5. How do you get the wax, and how is it purified?

CALIFORNIA.

ANSWERS.—Before answering your questions, let me advise you in the strongest terms, if you have any thought of starting in the bee-business in the spring, to get one or more text-books on bees and make a thoro study of the matter. It is perhaps not putting it too strongly to say that for every colony you start with you can afford to pay a dollar for a text-book, rather than to do without. If you start with 14 or 15 colonies, the careful study of a good text-book may easily make a difference of \$14.00 or \$15.00 in results. The advice can hardly be made too emphatic, get a good text-book and study it. Now to your questions:

1. With the old-fashioned skeps or box-hives, the common way to decide as to the amount of honey in a hive was to heft it. Every pound of honey, of course, adds just so much to the weight, and by lifting the hive you can gain some idea as to the weight of its contents. You may do

the same way with hives of a more modern pattern, but there are better ways. Nearly all modern hives—perhaps it is better to say all modern hives—have movable combs, and you can take out the combs and see how full they are. But you must understand that there are two different apartments that may be in a hive—the brood apartment, and the surplus apartment. Generally no honey is taken from the brood apartment, and it is not very important to know how much honey is in it, only before winter or at such times as bees are gathering nothing, for if the brood-combs should become entirely empty of honey there might be starvation.

The honey taken is from the surplus apartment, and if it is to be extracted, then you can lift out the combs and see whether they are full. If it is comb, all you need to do is to uncover the top and see whether the sections of honey are sealed over.

2. Extracted honey is generally taken from time to time as often as enough combs are filled and sufficiently sealed. Some do not wait for the honey to be sealed, but it is considered better practice to wait until at least two-thirds of the cells are sealed. In such case the honey is thicker and riper. Some of the best bee-keepers do not extract till the close of the honey harvest, having a sufficient number of extracting-combs to allow extra stories to be added as often as needed.

While it is true that for extracted honey it is all the better to leave it on the hive till the close of the season, the same does not hold true for comb honey. The honey may be thicker and richer, but comb honey sells to a large extent on looks, and the whiter it is the better. If left on the hive after it is sealed, the comb gradually becomes darkened, so it is taken off as soon as a super full of sections is sealed over, with perhaps the exception of the corner sections, for if you wait till these are entirely sealed the middle sections will generally become darkened.

3. From what has been said you will see that in some cases all the surplus honey is taken, and in other cases only part. As a rule, however, all the surplus honey is removed from the hive at the close of the honey harvest.

4. Yes, each colony must have a queen of its own, so as to lay eggs enough to keep up the population. You might do with only one queen for several colonies by moving her in rotation from one hive to another, but this would be hard on the queen, and the colonies could not be kept strong. The plan is not advised.

5. Formerly there was an annual pruning of the combs, the lower portions of the combs being cut away, and wax was also obtained when colonies were "taken up" or brimstoned. Neither of these plans is now followed in this country, and wax is only obtained from the melting up of defective or broken combs, or of drone-comb, and from the cappings of extracting-combs. You will hardly need to take any wax for six months or more to come, and will have plenty of time to study up the minutiae of the matter before that time in your text-book. If you start in next spring with 14 or 15 colonies and with no particular knowledge about bees, it is quite possible that by the spring of 1901 you may have the brood-combs of 14 or 15 colonies to melt up into beeswax. Perhaps you may do well to start with a smaller number, increasing your number as you get experience.

Ventilation of Hives.

Mr. C. P. Dadant, on page 675, says, in telling how he places his hives in the cellar:

"We usually take them without cap, or bottom. Our hives are all supplied with straw mats. . . . In the summer we have an enamel cloth between the brood-combs and the straw mat. In the winter the enamel cloth is removed and the mat is laid directly over the frames, and this straw mat is quite sufficient to separate the hives that are piled one upon another."

I have puzzled my head not a little to know how his hives are ventilated. IOWA.

ANSWER.—In the summer-time enamel cloth under the straw mats prevents the bees from propolizing the mats, and when the enamel cloth is removed there is plenty of ventilation thru the mats. Even if a hive with a bottom-board should be set over the mat, the mat is of such thickness that the air from the hive can escape laterally. Unless the entrance of the hive is quite small, very little upward ventilation is needed. Indeed, my hives, when in the cellar, have no upward ventilation, but the wood covers are glued on tight, just as they were on their summer stands. But the entrance is large, 12x2 inches.

GEORGE W. YORK, Editor.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY,

118 Michigan St., Chicago, Ill.

ONE DOLLAR A YEAR.  SAMPLE COPY FREE.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadaant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. NOVEMBER 23, 1899. NO. 47.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Helping on the Pure-Food Bill.—On page 696 we suggested sending Rev. E. T. Abbott's address on pure-food legislation to members of Congress. Mr. Ariel Wellman, of Rensselaer Co., N. Y., acted on the suggestion, and afterward received the following acknowledgement from Representative A. V. S. Cochrane, to whom was mailed a copy of Mr. Abbott's address as given at the Philadelphia convention, and publish in this journal:

HUDSON, N. Y., Nov. 2, 1899.

ARIEL WELLMAN, ESQ.—

Dear Sir:—Your letter of Oct. 30 is at hand. Also the markt copy of the American Bee Journal, which I have read with much interest. I am thoroly in sympathy with the ideas there exprest, and certainly shall be glad to avail myself of any opportunity to promote the cause in which you are interested.

Sincerely yours,

A. V. S. COCHRANE.

We still have copies of the Bee Journal containing Mr. Abbott's address, and will be pleased to furnish them upon request for the purpose indicated above.

A Cuban Bee-Keepers' Association.—Mr. Harry Howe, now of Cuba, wrote us as follows Nov. 7, about the organization of the first bee-keepers' association in Cuba:

EDITOR YORK:—The office of Dr. James Warner, in Havana, was the place chosen for the organization of the Cuban Bee-Keepers' Association. Among other items of business was the unanimous election to honorary membership of the following: Frank Benton, O. O. Poppleton, E. R. Root, W. Z. Hutchinson, H. E. Hill and George W. York.

Resolutions asking for a foul brood law were past. Section IX of the proposed law requires the inspection of all

bees coming into Cuba, and the immediate destruction of those found to be infected with foul brood, without compensation to the owner. The customs inspectors are to notify the foul-brood inspector of all shipments of bees received.

The officers of the new association are: President, Dr. James Warner; Vice President, Padro Cassinona; Secretary, Harry Howe; Treasurer, Juan Ranelo.

The association has good prospects for success, as there are many special problems facing the Cuban bee-keepers which require co-operation for their solution.

HARRY HOWE, Sec.

We wish to thank our Cuban friends for the honor conferred upon us, as mentioned in the above. We also bespeak for the new Cuban bee-keepers' organization every possible success, and all the personal profit and enjoyment that comes from the interchange of ideas and the meeting together of those whose interests are so closely allied.

Exportation of Honey, the Australasian Bee-Keeper says, is the most important subject ever brought before bee-keepers, meaning, of course, bee-keepers of Australia. The London market does not take kindly to Australian honey with its very markt flavor, and the editor thinks the British palate has had so much of sweetened liquid that it cannot appreciate a delicate aroma. So the pure article must be sent without any mixing, educating the consumer to know what honey is. J. D. G. Caddan thinks there is a sufficient home market for the best honey, and producers of the dark article that brings only 2½ to 3 cents a pound should give up bee-keeping and take up poultry.

Honey for Bakers is being used more and more, says Editor Hutchinson in the Bee-Keepers' Review; "and the beauty of it is that they cannot use adulterated goods. The least amount of glucose 'spoils the cake.'"

Irritating Effect of Propolis on the Skin.—The perfect impunity with which nearly all bee-keepers handle propolis has caused reports of injury therefrom to be received with some degree of skepticism. Those who have had particles of propolis fly in the eyes know how very irritating it is to the tender membranes of the eye. Is it not reasonable, then, to believe that the skin on some people's hands may be so much more sensitive than common as to make propolis poisonous to them? It is well known that there is a great difference in the sensitiveness of the skin in different persons. Those who can handle poisonivy as freely as clover, and with as little harm, might be unwilling to believe it poisonous, were it not that so many can give sad testimony to the contrary. A few in this country have reported poisonous effects on the hands and face from propolis when they were scraping sections. Now comes Bonnmere de Chavigny, in Revue Internationale, and says that when he scrapes propolis from frames, supers, etc., with naked hands, markt results follow. Within 24 or 48 hours a redness of the skin appears, with an eruption of slight pustules, sometimes with and sometimes without smarting, these symptoms disappearing in two days or less. The most striking feature in the case is that after the end of a week or two the skin peels off in a disagreeable way, but without pain.

The Extermination of Basswood.—Editor Root says supply manufacturers may yet be obliged to make four-piece sections, from the fact that no other than basswood will do for the one-piece, and that is rapidly disappearing. If lumber could be brought from Canada free of duty, the matter would be different. Mr. Root says:

"The supply-manufacturer has been blamed for killing the goose that lays the golden egg. But the goose-killing was commenced first and carried on far more extensively by

furniture-makers. Since there has been such a sharp advance in the price of lumber, especially of pine, basswood has been used by planing-mills for regular house-building purposes. It is still cheaper than pine; and contractors, in order to meet old figures, have been compelled to take a cheaper lumber, with the result that basswood has been taken. Some of the most extensive lumbermen say they can see in our northern forests only about ten years' more supply of this favorite timber. The basswood areas are getting to be more and more scarce, with the result that section-lumber will have in time to be of some other less desirable timber.

"But perhaps you may ask why supply-manufacturers use this valuable timber when it is so much needed for honey. For the simple reason that the furniture-makers and planing-mills will use it if we do not. What care they for the bee-keeper who desires to produce honey?"

"The Question-Box is approved by Stenog, in Gleanings in Bee-Culture," says the Bee-Keepers' Review, "even if the answers are contradictory." But Editor Hutchinson thinks the contradictory answers give but little light if plain "yes" and "no" without any reasons.

Tin vs. Wood for Honey-Packages.—In Gleanings in Bee-Culture for Nov. 1, Editor Root has this to say in reply to a contributor who seems to disfavor quite strongly the use of tin honey-packages:

"Perhaps the kegs are more convenient for you at your end of the line; but our experience is that nearly all kegs and barrels of honey, by the time they get to Medina, are leaking slightly, and some of them badly. Our honey-man, Mr. Boyden, is completely disgusted with these wooden packages. On the other hand, he says honey in square cans holding 60 pounds usually comes thru in good order, and is much more convenient to sell again, because the packages are smaller, and the honey can be sold in large or small lots.

"There is no doubt at all that kegs are much more convenient for the producer; but they are a great nuisance to the average buyer; and in many cases it is the producer who has to pay for the leakage. He in turn becomes disgusted with his honey-man, as he naturally thinks he has misrepresented."

Right you are, Mr. Root. Wooden barrels are too risky to ship liquid honey in; and they hold too large a quantity for many users of honey, unless for large concerns who can take a carload for bakery purposes; and then even *they* prefer to handle it in tin cans.

We notice that scarcely any bee-supply dealer lists wooden barrels nowadays. Why? Because the handy and safer tin can is rapidly replacing the risky "wooden tubs" for shipping honey.

"Fillers" in Bee-Papers.—Editor Leahy, of the Progressive Bee-Keeper, has this "compliment" for convention essays:

"It always looks to me that the only importance that could be attached to bee-convention essays was for 'fillers,' as the ground covered by those essays is practically exhausted thru the bee-journals by the same writers before written for said conventions."

As the American Bee Journal publishes more convention essays or papers than all the rest of the bee-papers combined, of course the suggestion of using "fillers" strikes us the heaviest. But that is all right. We can stand it admirably. Just see what a fine "filler" Prof. Wiley's convention paper is, in this number, and the one by Mr. Doolittle, who is also an editor of the Progressive Bee-Keeper. Then turn back, and look at Mr. Craycraft's essay on bee-keeping in Cuba and Porto Rico; Mr. Abbott's on pure-food legislation; and others that might be named. Pretty fine "fillers," aren't they?

Then turn to the Progressive Bee-Keeper for November, and look at the "story" it is running—five pages of it in that number. Talk about "fillers!" If that isn't a "filler,"

we give it up. A bee-paper can hardly compete with the excellent story-papers of the present day—but as "fillers" stories may be a necessity for some bee-papers.

Editor Leahy spoke that time without thinking. There are too many of our best bee-keepers who have written essays for conventions, to dub their productions as "fillers," in the sense meant by Mr. Leahy. But in the best sense of the word they are like a big, wholesome dinner to a hungry man—a genuine "filler" and satisfier.

The Weekly Budget

MR. A. I. ROOT is cautioned by one of his lady friends—Mrs. F. I. Schuyler—who writes him thus, as reported in Gleanings in Bee-Culture:

"DEAR BRO. ROOT:—I am glad you have quit sending for patent medicine, and taking it to see whether it is good for anything, as I do not think it your duty to become a martyr for the benefit of your readers."

That is a timely caution for Mr. Root, for we understand that some of the "patent medicine" sent out is about 90 percent whiskey, and labeled "Bitters," so as to evade prohibition laws in certain States. It beats all how some men will lie in order to make a dollar. Money is the ruination of many a man. Some will even give their very souls, including their hope of immortality, for only a few paltry dollars. The "Almighty Dollar" is getting to be altogether too mighty.

FRANCIS JOSEPH, emperor of Austria, has an apiary in his private garden, not far from the windows of his palace, for convenience in observation. The government gives about \$12,000 a year for the purpose of developing scientific apiculture. It is worthy of note on the part of the various European governments, that they favor in every way men of talent, rich or poor, not only in bee-culture, but in all the arts and sciences. Even Russia, beginning with Peter the Great, has offered every inducement for artists and artisans to go there to live. The result is, that St. Petersburg is now probably the finest capital in Europe, while less than 200 years ago its site was a dreary bog. The king of Bavaria appropriates annually about \$8,000 to promote scientific bee-keeping.—Gleanings in Bee-Culture.

THE THANKSGIVING NUMBER of the Saturday Evening Post, in its stories, poems, pictures and general articles, will be the most attractive number of the magazine yet issued. In this number Robert W. Chambers has a seasonable out-of-door story, entitled "The Hunter"—the romance of a poacher's pretty daughter. Other features are: Edwin Markham's latest poem, "The Lyric Seer;" "An Electrical Transaction"—a Tale of the Transvaal War by Robert Barr; "At Dawn," by Octave Thanet, and "The Minister's Henhouse," a droll story by C. B. Loomis. Two notable articles in this number are "Lincoln as Candidate and President," by his old friend and political ally, Colonel A. K. McClure, and "Our New Prosperity," by Frank A. Vandrelip, Assistant Secretary of the Treasury. The Thanksgiving number of the Saturday Evening Post will be on all news-stands Nov. 23, at 5 cents a copy. If not convenient to get it there, address the publishers, Curtis Publishing Co., Philadelphia, Pa., enclosing the amount.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

The Premiums offered on page 749 are well worth working for. Look at them.

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

We deal almost exclusively in honey, giving it our closest attention all the year round.

We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.

We are acquainted with the most desirable trade thruout the country, and know exactly what their wants are.

We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?

We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

HILDRETH & SEGELKEN,

120 and 122 West Broadway, NEW YORK CITY.

43A7t

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and

ELECTRIC

rear bounds are made from the best angle steel, which is neater, stronger and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4,000 pounds anywhere. Write the Electric Wheel Co., Box 10, Quincy, Ill., for their new catalog, which fully describes this wagon, their famous Electric Wheels, and Electric Feed Cookers. Please mention the Bee Journal.

Glass Honey-Jars!

We have two sizes of clear, flint-glass Jars, No. 1 holding a scant pound of honey, with an opal or white top held on with a screw metal band under which is a rubber to prevent leakage. No. 2 is a rather tall flint-glass jar with tin screw-cap, holding 1/2 pound of honey. Both are excellent for retail honey-packages, and are put up in single gross lots. The prices are per gross, Foot, Chicago, for the No. 1 jars, \$5.25; for the No. 2, \$4.25.

We can fill orders promptly for these jars. They give excellent satisfaction, we know, for we have used the same jars for several years.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

BEE-KEEPERS! Let me send you my 64-page CATALOG for 1899, J. M. Jenkins, Wetumpka, Ala.

Please mention Bee Journal when writing.

Warning Cellars with Oil-Stoves is all right, according to the Bee-Keepers' Review, providing there is provision for carrying out the foul gases without having them mingle with the air of the cellar. The editor once heated his office in the fall with an oil-stove, but had to quit it on account of headache. There was no chimney to carry off the vitiated air. In cold spells he had warmed his cellar with an oil-stove, and found it to work all right. But he had a hood over the oil-stove connected with the stove pipe in the room above by means of a 2 1/2 inch tin-pipe.

Moving Bees on a Wagon.—A beginner asking in the National Stockman about moving bees on a wagon, is answered in part as follows:

Just what is the best way to fasten the bees in without fastening the air out, depends somewhat on the kind of hive. If it is a box hive, the hive may be turned upside down and wire cloth fastened over the entire opening of the bottom that is now the top, and the hive may be carried in this inverted position. Be sure that you don't lay a hive on its side; the combs would almost be sure to break down. Better prepare your hive for moving at a time when bees are not flying, in the morning or evening. On a cool day when bees do not fly all day, the preparation may be made at any time of day. Give the bees just enough smoke to keep them in the hive till you get them fastened in.

If the bees are in a movable comb hive, carry them right side up. If the entrance is large enough to amount to six square inches or more, and if the day is too cool

The Midland Farmer

(SEMI-MONTHLY).

The representative modern Farm Paper of the Central and Southern Mississippi Valley. Page departments to every branch of Farming and Stock-Raising. Plain and Practical—Seasonable and Sensible. Send 25 cents, silver or two-cent stamps, and a list of your neighbors (for free samples), and we will enter your name for 1 year. If you have not received your money's worth at end of year, we will, upon request, continue the paper to you free of cost another year.

W. M. BARNUM, Publisher,

THE A. I. ROOT CO.
MEDINA, OHIO.

for bees to fly, say down to 40° or thereabouts, all that is necessary is to close the entrance with wire-cloth. If the day is warm or the entrance small, it is better to take off the cover of the hive and put wire-cloth in its place.

"If you can have your choice just as well, it may be better to take a day when the thermometer stands somewhere from 45° down to 32°, or even a little lower, for on such a day if some of the bees should get out they will not be likely to sting the horses."

Queen-Rearing is discust in Australasian Bee Keeper by H. L. Jones, the man said to have the largest queen-rearing establishment in Australia. He says a large percent of cells will be accepted and work out in an upper story over a strong colony in a honey-flow, otherwise there must be steady, judicious feeding, and it is then better to have the cells started in strong, queenless colonies, two days later putting them in an upper story between two frames of brood in all stages, this brood having been put in the upper story a day or two previously. He has been fairly successful in getting cells accepted without royal jelly, but better with it. Altho the bees remove all the jelly given, it seems to act as a suggestion to them. A hot knife is needed to cut the cells apart, and if a cell is given to a nucleus at the same time its queen is removed, a cell-protector is used. With larvæ of the right age, the queens hatch in a little more than 11 days, and begin laying 10 or 11 days later.

Four Stray Straws in Gleanings in Bee-Culture read as follows:

"Sometimes it happens that, by some means, some nice sections of honey have their faces so daubed as to be almost spoiled. Put a super of such sections over a hive and take away as soon as the bees have had time to lick off the daub.

"I never used a sheet of cloth, as mentioned by Capt. J. E. Hetherington, to cover honey cases in a car, but last week I used newspapers, tacking them lightly on the cases. The cloth has the advantage that it is all in one piece. Perhaps better than either would be manilla paper pasted together.

"Mr. Editor, if you think it for the general good to have your program arranged to shorten up the spelling throught the whole catalog of words ending in *ue* and *ugh*, I'll try to bear it manfully, even tho it does sometimes jolt me in reading. But, say: won't it leave the word rather short if you drop the final *ugh* from the interjection "ugh?"

"You cannot give the absolute weight of any section of a given size, for one year it will be heavier than another. But I can give the relative weights of 3 kinds of sections for this year. 5676 beewax 4 1/4 x 1 1/2 averaged 14.94 ounces; 442 plain 5x4 1/4 x 1 1/2 averaged 13.82 ounces; 345 plain 4 1/4 x 4 1/4 x 1 1/2 averaged 13.83 ounces."

Getting Bees Out of Sections is thus discust by F. Greiner in the American Bee-Keeper:

"There are probably but few up-to-date bee-keepers who do not find the escape a very fine thing. I consider it indispensable. But after all I have been obliged to give up its use on the hive when removing honey (comb or section honey) after the honey season is over, on account of our bees perforating or biting the cappings. When honey is still coming in everything works lovely and that is natural enough. Let us see how it does work:

"When the bees leave a super full of honey they take with them, each and every one, a full load of honey. During the honey flow most bees have their honey sacs filled. Besides, plenty of unsealed honey is in reach; they do not find it necessary to uncap any honey to get their fill. But after honey-secretion has stopped conditions are reversed and one must force the bees out of a full super very quickly or the cappings will suffer. I practice the following method:

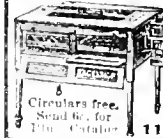

"I first remove the cover—honey board or

quilt—using some smoke; then I lay a wet or damp sheet over the super to be removed; next I grasp the sheet near the center on one side of the hive lift it up slightly, poke the nozzle of the smoker under it and give smoke plentifully, at the same time flipping the sheet. This procedure forces the smoke into all the spaces between the sections and drives the bees down quicker than any other method I have ever tried. I learned this of Mr. Coggsball of lightning fame. As soon as I think the bees are nearly all out, I snatch the super off and give it two or three vigorous shakes which will dislodge the few bees that may have remained. It is a simple method and does not take nearly as long as it takes to tell. The escape-board is now brought into use. The bee-freed supers are stacked up in piles with one escape under it and one on top of each. At dusk the supers are wheeled to the honey-house. The Porter escape is not well suited for use on a stack; any cone escape, letting in direct light, works very much better."

The Long-Ideal Hive has some attention in Australian Bee-Bulletin. "Loyal-stone" says:

"Just a word regarding this my favorite hive. I don't ask bee-keepers to adopt it; I gave my experience with it and will have no other hive. I find that 20 frames are quite sufficient for a bee-keeper who knows his business, and only suggested putting another box on top for bee-keepers who cannot devote proper time in the honey season to attend to their bees. It requires a good deal of experience to work this hive properly."

On the other hand, says "Australian Yankee": "Let me give a little experience that I had with them last season: The bees built up splendidly in them, the queens occupying 20 frames, and the hives packed with bees (a novice with them would have been jubilant, but I had seen the same thing before), but not a move towards storing surplus honey, only a little along the top-bars of the frames. I extracted this out; the bees slowly filled them to about the same amount. At the same time the bees in 8-frame hives were filling their extracting-supers about every 10 days, thus more than doubling the ones in the long ideals. Well, I stood it as long as I could, and then I put the bees that were in the long-ideals into 8-frame hives, using a queen excluder, when, 'presto,' they went to work storing surplus as quickly as the others. This was not one hive only, but all the long-ideals I have. I have now cut them all down to 8 frames."

The conclusions of the editor are: "The long-ideal hive is a non-swarming hive, es-

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs, of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

pecially if empty frames be kept near the entrance. Being so large, as a rule, they will not need to be extracted from more than once in a season. In those two items there are great gains to the bee keeper.

Satisfied with the Results.

I have had very good success with my bees. I lost two colonies last winter, had three left, and have 10 now, and got about 75 pounds of honey. HANNAH E. HESS, Grand Traverse Co., Mich., Nov. 5.

Crop Almost a Total Failure.

The honey crop was almost a total failure here. Bees secured enough to winter on, provided we cellar them in good shape; but the colonies are very light in bees this fall, owing to the queens not working during the August dearth of honey. We need not be surprised if 50 to 75 percent of the bees perish where wintered on the summer stands without extra protection.

F. KINGSLEY.

Thayer Co., Nebr., Nov. 1.

Bees Did Fairly Well.

The bees have used me fairly well this season, considering that it has been a poor one for our warm-hearted pets, taking the State as a whole. The spring was backward and cool here with plenty of wind. My bees wintered finely, and came out strong in numbers, but they just held their own until June, when the clover bloom came, and wet weather came with it. About June 15 good weather came, and with it the swarming-fever, and swarm they would out of empty supers and almost empty hives. Still, I secured 800 pounds of comb honey of the best quality, from 15 colonies, spring count, and increase to 30, besides having two large swarms take Horace Greeley's advice and "go west." I attempted to go with them, but as I am obliged to wear a No. 10 coarse leather boot, at times, I was unable to persuade

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

them to travel as fast as the emigrants wish to, so they whispered a fond farewell about a half mile from the apiary. They neglected to let me know where they settled, but I understand they staked out a claim near Chicago, in order to be near a central market, thus saving transportation charges. They may be able to compete with those glucose fellows.

O. B. GRIFFIN.

Aroostook Co., Maine, Nov. 10.

Season Almost an Utter Failure.

I have a small apiary consisting of 23 colonies which gave me about 275 pounds of comb and extracted honey the past season, with no swarms. Special pains were taken in nursing them continually; I fed them up this fall with 375 pounds of granulated sugar, reducing it to a thick syrup, and added about 30 pounds of extracted honey to the whole; adding this to the more or less storage the colonies already had, they must be in good condition for winter.

For almost utter failures of honey crops, the seasons of 1898 and 1899 surpass anything of the kind known in the history of northwestern Ohio. No one thinks of fall-feeding their colonies here. Having failed two seasons in succession, I am still intensely interested in bee-culture. We hope for better things next year.

M. N. SIMON.

Wood Co., Ohio, Nov. 15.

Origin of Honey-Dew.

In the American Bee Journal of August 31 appeared an article on honey-dew, by C. C. Parsons, which ought to be published in all the bee-papers of the United States. It is the first time that I have noticed or read anything on honey-dew from what I consider a right standpoint.

It is true, as Mr. Parsons says, that the consumption of honey has been lessened by the publication of papers in which honey-dew was called "bug-juice," or the secretion of insects. Is it not strange that the human mind will cling so strongly to error, especially in the case of honey-dew, when the truth would be more pleasing and profitable? This is a field in which the "great lights" of the bee-keeping fraternity are invited to enter and investigate. The animal secretion of honey-dew is not the only erroneous idea that has found its way into good company. The sap of all plants contains sugar; starch is also perhaps always present in growing plants, and as starch is convertible into sugar the formation of sugar is probably more rapid at certain times than can be utilized or absorbed into wood fibre, and flows out thru the pores of the plant in the shape of honey-dew. This, however, is a subject of scientific investigation, which has nothing to do with the flow of sugar-water or honey-dew out of the leaves of plants—a fact which is well authenticated, and which almost any one can observe if he wishes to.

Nemaha Co., Nebr.

E. H. GABUS.

Honey-Yield in S. E. Minnesota.

In line with the big honey-yields tabulated on page 693, I give the following:

In about 20 years' bee-keeping experience in Fillmore Co., Minn., my average per colony, spring count, has been about 100 pounds of extracted honey. My largest yield was in 1886, with a bunch of 15 colonies; condition in spring, average; yield per colony, 400 pounds of extracted honey. The yield of honey was not phenomenal at any time, but continuous during the entire summer. The first extracting was towards the latter part of May; last extracting Aug. 29, after which they filled up for winter. Increased the 15 to 40 colonies. The yield of the same bees for the next year was 200 pounds per colony for the lot.

My next best yield was a lot of 16 colonies, in average condition, in the spring of 1896, placed on a farm about nine miles from the place of the first and best yield. The yield per colony for the summer of

1896, was 262½ pounds of extracted honey, and increase to 40 colonies. From these bees in the spring of 1897 I sold 10 colonies at \$6 00 per colony, and the yield of balance was 90 pounds to the colony, in a poor year for this locality, and increase to about 50 colonies.

In the spring of 1898 I sold 35 colonies from them for \$200, and from the remainder secured 1,200 pounds of honey, with 30 colonies of bees on hand in the fall.

My average for my whole lot of bees in 1896 was 166 pounds to the colony, spring count.

Last winter all my bee-cellars but two froze badly, and all were wet, but in one, on account of this and their poor condition in the fall, I lost 170 colonies. Of the 120 colonies left, I got about 4,000 pounds of honey, and from 14 which I bought I got about 1,000 pounds, being only about 5,000 pounds from 134 colonies, with an increase to 280 colonies. The past season was the worst in my experience in this country.

Fillmore Co., Minn. M. V. FACEY.

Convention Notice.

Minnesota.—The Minnesota Bee-Keepers' Association will hold its 11th annual meeting at the Court House in Minneapolis, Wednesday and Thursday, Dec. 6 and 7, 1899.
J. P. WEST, Pres., Hastings, Minn.
DR. L. D. LEONARD, Sec., Minneapolis.

The Sure Hatch Incubator Co., of Clay Center, Neb., are carrying their advertisement for the new season's business in these columns. We request our subscribers to read it. These people have not been in the incubator business as long as some others of our advertisers in this line, but the high quality of their machines is attested by the success they have made. It is generally supposed that a man or a machine is most successful away from home. If home success is a recommendation, and we believe it is, then the Sure Hatch people have many reasons for congratulation, as their machines are used very extensively in their own county and State. Read the advertisement and then write them; they may have just exactly what you want. Please don't forget to mention the American Bee Journal when writing to them.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Nov. 7.—There is a firm tone in all kinds of honey, even buckwheat sells easier than of yore. 10c is obtainable for the best white comb which we class as fancy, and 15c for No. 1 grade; stained and off grades of white, 13½ 14c; amber, 10½ 12c; and dark to buckwheat, 9½ 10c. Extracted white clover and basswood, 8½ 9c; amber, 7½ 8c; dark, 6½ 7c. Beeswax, 27c.
R. A. BURNETT & CO.

CINCINNATI, Nov. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8½ 8c; amber and Southern, 6½ 7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15c 16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth.

KANSAS CITY, Nov. 9.—We quote No. 1 white comb, 13½ 14c; No. 2, 13 13½c; No. 1 amber, 13 13½c; No. 2, 12 13c. Extracted, white, 7½ 8c; amber, 7 7½c; dark, 5½ 6c. Beeswax, 26 22c.
C. C. CLEMONS & CO.

NEW YORK, Oct. 30.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13 14c; amber, 11 12c; and buckwheat, 9 11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c gallon. Beeswax quiet at 26 27c. HILDRETH & SEGELKEN.

BUFFALO, Nov. 6.—Actual supplies in Buffalo are smallest for several seasons at this date. Strictly fancy 1-lb. comb, active, 15c; No. 1 and choice, 13 14c; dark, buckwheat, etc., 8 12c, as to grade. Beeswax, 27 28c. BATTERSON & CO.

SAN FRANCISCO, Nov. 8.—White comb, 11½ 12c; amber, 8 10c. Extracted, white, 7½ 8c; light amber, 7 7½c; amber, 5 5½c; Beeswax, 26 27c.

BOSTON, Nov. 7.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13 14c; buckwheat will not sell in this city. Extracted, light amber, 7 8c.

We are pleased to note that our market continues in splendid condition. While the supply is light, yet, owing to the high prices, it seems to be quite equal to the demand. Later on when the trade realizes the shortage more thoroly the demand undoubtedly will be much better.
BLAKE, SCOTT & LEE.

ALBANY, Nov. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13 14c; mixt, 11 13c; buckwheat, 10 11c. Extracted, white, 8 9c; mixt, 6 7c; dark, 5. Beeswax, 26 28c.
MACDUGGAL & CO.
Successors to Chas. McCalloch & Co.

OMAHA, Oct. 14.—The market is now well supplied with new crop honey and trade is taking hold readily at 14 14½c for fancy white in round lots, with about one cent less for light amber. Dealers are fully satisfied now that the crop is light, and not holding back purchasing any longer for fear of lower prices. White extracted, 8c.
PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15 16c; No. 1, white, 14 15c; dark grades, 10 12c. Demand good and supply light. No extracted in market. White would sell for 8 8½c. Beeswax, 25 26c.
M. H. HUNT & SON.

CLEVELAND, Oct. 18.—Fancy white, 16c; No. 1 white, 15c; fancy amber, 12 13c; No. 1 amber, 11 12c; fancy dark, 9 10c; white extracted, 8 8½c; amber, 7 7½c. A. B. WILLIAMS & CO.

WANTED.—Comb and extracted honey; state price, kind, and quantity.
R. A. BURNETT & CO.,
33A13t 163 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery.

A LITERARY GEM

THE MOST

ENGAGING BOOK

EVER WRITTEN

BY IAN MACLAREN

REV. H. M. WHARTON, D.D.

J. WILLIAM BUEL, Ph.D.

"The Golden Morning"

A BOOK FOR WHICH THE WORLD HAS WAITED

ITS PLACE IS IN EVERY CHRISTIAN HOME

IT WILL BIND THE BIBLE CLOSER TO THE PEOPLE

IT IS SURE TO EXERT A POWERFUL INFLUENCE FOR GOOD

NOTHING LIKE IT EVER BEFORE WRITTEN

NOT TO BE HAD - IN - BOOK STORES

NEWS AND GOSSIP OF A NEW BOOK ON THE BIBLE have been current in book and Christian circles everywhere for some months. In its authorship was to be combined the superb talents and literary abilities of three of the greatest lights in the world of religious literature.

The book is about to appear and on its title page in collaboration as authors are found the names of that most popular of all writers, the great Evangelist, and J. WILLIAM BUEL, Ph.D., one of the most prominent and popular writers on Biblical subjects. **A MASTERPIECE INDEED** must be the book which calls to its creation such a combination of unmatchable talents. **IT IS A MASTERPIECE**—and it is good news we bring our readers when we tell them that after the most persistent endeavor and the most industrious and earnest negotiations with the Publishers, this paper is one of a syndicate which has secured the entire first edition for distribution among their subscribers, **not as a means of winning profits**, but to encourage the people to become regular readers, because of the unusual privileges which are offered regular patrons.

The book is entitled "**THE GOLDEN MORNING**," and while it was intended to be a \$5.00 book, and has everything about it—authorship, illustrations, paper, printing and binding—to warrant that price, we have, after many objections and refusals, made terms whereby **WE ARE IN POSITION TO OFFER IT TO OUR READERS AT A GREAT REDUCTION**. It contains nearly 800 pages and over 500 superb illustrations. It is printed with clear type on coated paper, and is bound in beautifully illuminated covers, with gold and colored stamping.

IT IS IN REALITY THE BIBLE IN STORY FORM arranged so as to assure a perfect understanding of **THE GREATEST OF ALL BOOKS** even by little children. All ambiguous and obscure phrases and descriptions have been put into language which makes them clear as noon-day. The historic events have been arranged in their proper order, and the story is made continuous and of absorbing interest throughout. Poetical description so freely used in the Bible, and the many Parables, have all received analysis and now appear as plainly told tales which need no interpreter or explanation.

Hundreds of artistic and accurate pictures have been used to embellish its pages and fix in the mind of reader or student the scenes so graphically described. No book of a religious nature has ever been so sumptuously illustrated. This feature alone costing an enormous sum of money, as every drawing was made especially for this work.

It will be of highest value to the young, as from a few readings, they will get such an understanding of Bible truths and promises from this book, that it would require years for them to gather through Bible reading or study. Indeed, one of the chief claims of "**THE GOLDEN MORNING**" to universal popularity, is that the children will learn to reverence and love the Bible and to accept its teachings through reading this charmingly written story.

WE ARE READY TO DISTRIBUTE THIS GRAND BOOK AMONG OUR READERS who should order at once, as our portion of the introductory edition is limited. The prices are as follows, **WITH POSTAGE PREPAID**:

| | |
|--|---------------|
| BOUND IN EXTRA FINE CLOTH, BEAUTIFUL GOLD AND COLORED STAMPING | \$2.75 |
| SUPERB HALF MOROCCO, WITH BURNISHED RED EDGES | \$3.75 |

THE BOOK WILL NOT BE ON SALE IN BOOK-STORES, AND SHOULD BE ORDERED FROM THE OFFICE OF THIS PUBLICATION. EACH ORDER WILL BE PLACED ON FILE ON ITS ARRIVAL AND FILLED IN THE ORDER RECEIVED. BECAUSE OF THE EXTREMELY NARROW MARGIN OF PROFIT, CASH WILL BE EXPECTED WITH EACH ORDER. SHOULD THE BOOK BE UNSATISFACTORY WHEN RECEIVED AND EXAMINED, IT MAY BE RETURNED AND THE MONEY WILL BE CHEERFULLY REFUNDED.

CONTRIBUTED ARTICLES

A House-Apiary and Its Management.

BY EDW. S. GOUDGE.

I HAVE a bee-house which I built two years ago, the convenience of which far exceeds what I had expected, as I now manage my bees with about one-quarter of the labor that was formerly necessary. Years ago the idea of a house or shed for the hives was considered, but on account of adverse reports of their advantages in the bee papers and books, I let the matter drop. But in the summer of 1897 my 10 colonies gave me so much work, unpacking and storing away cases, shading the hives, carrying supers, and fixing up for winter, etc., that I began to contrive some plan to lighten the work, and the bee-house shown in the picture is the result.

I now have no winter cases to bother with, such as keeping the covers waterproof, lugging about and storing them away, etc.; no more shade-boards to aggravate me; the supers are kept just behind the hives, where they are always handy; the building is a bee-house, a honey-house, and screen-house, all in one. It protects the hives from the sun, wind and rain, and also keeps the bees snug during cool spells. The supers, when taken off, are stored, comb honey is sorted, and all extracting done right on the spot. A hive can be opened without the hindrance of robber-bees, and other work such as feeding, etc., is done with far less time and labor than if the hives were outside as ordinarily.

The bees become accustomed to the noise of extracting, etc., but I think it best not to disturb them by entering the house after dark, and if I need to go into the building between Nov. 1 and April 1, I take care to do so quietly.

My bee-house was built for 5 colonies only, which num-

ber is what I have now, my regular occupation making it unwise to keep more.

I believe that if there is prejudice against bee-houses it is because they are not always planned rightly, which makes all the difference.

In building the house, while aiming at the desired features, I also tried to avoid the undesirable ones. I understood that with bee-houses the danger of losing young queens was great, so I overcame that by not setting the hives too close together, and by making the entrances conspicuously different.

The hives occupy the south half of the building, spare supers, etc., being stored against the opposite wall, about 3 feet back of the hives. There is about 20 inches of space between each two hives, in which I set empty hives ready for swarms when in season. The 5 colonies set in a row about 10 inches back from the wall of the house, and each entrance opens into a separate niche, which is painted so as not to look like any of the others. The hives rest on the floor, and each has its bottom-board, so that a colony can be lifted without the bees spreading over the place. By not having one hive above another, 6 or 8 supers can be added if necessary.

When a swarm is expected from a certain hive, an empty one is put alongside, and setting between two hives its entrance opens on two niches; but only half the entrance is left open, that is, the half nearest to the hive from which the swarm is expected, the other half being closed with a block made for the purpose. When no

swarms are to be attended to, all the half entrances are closed with blocks.

I control the swarms by having the queens clipped, and when the swarm is in the air the queen is secured in a small cage, and a trap having two escaping cones, made to adjust to the entrance of the colony that swarmed, prevents any bees going back, but allows those that wish, to go out.

When the swarm commences to return and crowd out the entrance, the queen is liberated either amongst them near the entrance into the empty hive, or else we put her into the hive from inside the house. The bees are a very few seconds in finding the entrance into which we wish them to go, and the swarm hives itself in a way that would please any bee-keeper.

House-Apiary of Mr. Edw. S. Goudge, of Nova Scotia.

When the swarm is all in (or perhaps we wait until the evening), we exchange the places of the swarm and the old hive. If supers were on they are now put on the swarm, with an additional one, if necessary. The half entrance thru which the swarm entered is then closed, and the other half opened. The trap is now taken off. All the old bees that leave the old hive the next day will not go back, but will unite with the swarm.

There are many ways of managing the colony in the old hive. Some nuclei can be made, or all the bees can be run in with the swarm, and the combs given to some colony being worked for extracted honey, or the old hive can be depleted of its bees by simply closing one half-entrance, and opening the other, alternately, every 5 or 6 days: the bees not being able to get back by the way they came out, will go into the next hive (perhaps this plan would not work during a dearth of honey); or, the old hive can be moved on the fifth or sixth day, and form another colony.

When examining any particular hive, the shutter in front is let down to admit light. The front of the house is composed of 5 shutters. When the bees are inclined to rob, and we wish to examine a hive, we do not open the shutter, but lift the supers off, and set them on an empty hive alongside, and the brood-chamber is carried to near the window which has a screen running up about 6 inches outside, allowing the bees to escape but not return; the sash is hung, and when necessary is pushed up, the bees leaving the glass and escaping at the top of the screen.

When fixing the hives for winter, 2-inch rims are put underneath, the entrance being at the upper edge, thereby preventing the dead bees from stopping it up during the winter. The oilcloths are left on as in summer. I have discarded upward absorbents. Empty hives are put between each colony to fill up, and a light lattice partition about 2½ feet high is adjusted behind the hives, and dry leaves are then stuff in. I generally use pads made of about 50 thicknesses of newspaper next to each hive, and like the idea.

In the spring the lattice is lifted out and fastened up to the roof, out of the way, and the leaves filled into bags for next time. Packing and unpacking in the house can be done in the evening, on a wet day, or whenever convenient.

The hives are about 12 inches above ground, and where formerly I had to shovel snow very often during the winter, the last two years I did not have any of that work to do, but merely see, once or twice, that the entrances were not blocked up.

Hard-coal ashes are spread about 3 inches deep in front of the building, so that grass does not grow over the entrances.

If I were building another bee-house I would, perhaps, not put up as expensive a one, but would build a sort of lean-to shape, and batten the sides, covering the roof with felt paper.

The materials of my bee-house cost about \$15, and I did the work in my spare moments.

If I were keeping 50, 100, or more, colonies, I would like to have them in bee-houses, about 20 hives to a house. By not having more than 5 colonies in a row, and by planting a few shrubs in front, besides having the niches different colors, I do not think there would be as much danger of queens being lost, and the bees confusing their hives, as in the average apiary, where usually all the hives look alike.

Nova Scotia.

Amalgamation—The Bees-and-Grape Question.

BY C. P. DADANT.

I HAVE just read the American Bee Journal for Nov. 9, and I am exceedingly happy to see that steps are being taken to merge our two bee-keepers' associations into one, and that in all probability the amalgamation will be effected. This is a step in the right direction. In these days of trusts and trades-unions the men who go their single way in the world are lonely indeed, and if in union there is strength, we can only gain by a thoro and compact adhesion to one another. Let us then all unite our best efforts to make this amalgamation successful, even if some of us must give up some of our own ideas, or theories, for the common good.

In the same number of the Journal, I notice a remark by Mr. Hasty concerning the feelings of a man who is no bee-keeper and has to pick grapes when they are covered with bees, owing to the stings he may have to withstand. This remark is made concerning the article from me on this

subject, and which our editor had kept so long that I had entirely forgotten having written it. I must say that the additional experience which I have gained in the course of two years, since that article was written, serves only to strengthen me in my views as expressed not only in that article, but in many other articles and essays on this subject read before farmers' institutes, horticultural meetings, high-school classes, and bee-keepers' associations at different times. And concerning the possibility of people getting stung by the bees on damaged grapes, I must say that altho we have a vineyard of large size, and employ all sorts of people—men, women and children—to pick the grapes, we have not, in our mind, a single instance of any one getting stung, tho it is quite probable that some careless people may get stung on the fingers if they grab a bunch of grapes by the handful when bees are upon it.

But it is well known that bees, when away from home, do not sting unless absolutely molested, and therefore the danger from stings to the grape-pickers is so remote as not to be worth a thought.

But it is of great importance to remove prejudices of this kind, especially as they are based upon what are thought to be facts by the uninformed. The average grape-grower, when he sees bees in his vineyard, does not stop to investigate what is the original cause of the depredation, but simply charges it to the bee-keeper's pet. If he knew to a certainty the limit of their depredation, and that he must look elsewhere for the original and only true cause of his loss, his feelings, even if he carelessly caused a bee to sting him, would be altogether different from what they are under ordinary circumstances when he thinks himself wronged by some other man's profit.

The proof that bees do not, cannot, injure sound fruit, is easily made, but it takes some experimenting to do it, and very few people will take the pains to satisfy themselves. But a teaching of this fact in our public schools will make the matter right, sooner or later. It is much more difficult to demonstrate that the earth turns around the sun, and yet this fact has been so thoroly taught that no one is found among even the most illiterate in our civilized countries who doubts it.

But are there not many other things which some of our farmers believe as gospel truth which are yet just as false as the supposition that bees puncture grapes? What about the belief that wheat changes to cheat or chess, under certain circumstances? I was even told by a very nice and comparatively well educated farmer, that he would agree to change wheat to cheat, and the latter to timothy in the space of three or four years. His method was to cut the joint of the stem during the winter so as to weaken the plant. I referred him to Gray's Botany which ranges the two plants as entirely different species of the order graminaceae, so they could no more be raised from each other than rye could be raised from oats. But to no purpose. These beliefs come from superficial observation. A thing is taken for granted which a thoro experiment would disprove.

There are many other such erroneous beliefs. Did not our ancestors believe that the divining-rod could find not only water, but treasure, and even thieves and murderers? And I have no doubt that even to-day some successful gold-diggers could be found who would assert that their lucky find was guided by a willow twig! Hancock Co., Ill.

Propolis for Grafting Purposes—The South African Honey-Bird.

BY S. A. DEACON.

TO what use is the enormous quantity of propolis put which the thousands of bee-keepers in the United States produce? It must, if carefully collected, amount to some tons. I ask this question because, in looking over some old numbers of the American Bee Journal, I happened on an enquiry for a recipe for grafting-wax, and which, I think, Dr. Miller answered. (Of course, the Doctor knows pretty well everything, only you mustn't ask him anything about bees!) Beeswax, resin, and, I think, whale-oil, was the formula given.

Now, I have done a good deal of grafting the past 30 years, and have never yet found anything to come up to propolis, and as long as that is to be had I would never think of using anything else. Propolis is always accumulating with me, for it is as carefully collected as wax, and every year there is a demand on the store for grafting pur-

poses. With 70 colonies of bees and a 6-acre orchard, supply and demand are about equal. Of course, the propolis has to be rendered plastic by warming over the fire before using, when, by keeping the lump against your breast, it will remain soft any length of time.

There is no better grafting material than propolis, and if orchardists were aware of that fact there should be a good demand for it at a price that would make it pay to collect.

Some time ago a contributor to the American Bee Journal suggested that I might tell something about the interesting habits of the *Indicator minar*, or South African honey-bird. I complied, and mentioned that the curious little critter is as likely to lead one into danger as to a beehive, and told how that one had once led me, and that when unarm'd, into a narrow, rocky defile, and right on to the fresh tracks of a large tiger. He would have brought me, probably, on to the beast himself had my practiced eye not caught sight of the "spoor," and had I not, with anything but gracious words, refused to follow him farther. Sometimes they will lead one to a cobra, or to a sleeping puff-adder.

I refer to the subject again because the other day one of these birds led me a long dance after him in the boiling sun, and just when by his excited antics I concluded I was near my reward, and my mouth was beginning to water for honey, the little rascal showed me, lying prone in the shade of a bush, the malodorous form of a drunken hottentot! Upon mentioning this to a neighbor he told me that one of these birds once led him to a buck, taking a siesta on the shady side of a bush; and that upon another occasion he followed one a long distance, to be shown a little bundle of recently bought store-goods tied up in a white handkerchief, and which some one had dropt. They attract one's attention by fluttering on the ground just in front of one, then going ahead and repeating it.

A Boer neighbor of mine always shoots them when he gets the chance. He is a great honey-hunter, and complains that while he can track bees to their rocky nests without these birds' aid, the little beggars are always showing other people nests of whose existence and with whose locality he alone would otherwise be acquainted.

South Africa.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 742.]

THIRD DAY—FORENOON SESSION.

The forenoon session of the third day was called to order by Pres. Whitcomb, and Dr. Mason offered prayer.

The following paper on "Bees or Honey—Which, in Spring Management?" by Mr. D. W. Heise, of Ontario, Canada, was first on the morning's program:

Bees or Honey—Which, in Spring Management?

If I were allowed to construe the above title according to my own ideas, I would have it read as follows: Should the bee-keeper's spring management be along the line of securing a large force of bees at the "expense of honey," or *vice versa*? If this, then, is a proper interpretation of the title, I would unhesitatingly answer, BEES, BEES, FIRST, LAST, and all the TIME. It would be just as consistent for the dairyman to expect the production of a large quantity of butter without first securing the cows, and the poultryman eggs without first having the fowls, as that the bee-keeper could expect a large crop of surplus honey without first securing a large force of workers to gather the nectar from the flowers.

Knowing, as we do, that the inventive genius of man has not yet devised any means by which the nectar can be extracted from the blossoms, stored in our hives, and trans-

muted into honey without the intervention of the busy bee, it follows as a natural consequence that we are still dependent upon the bees to carry out this important work. This, then, being the case, it follows that our prime object in spring management should be the securing of a large working force of the proper age before the main honey harvest opens. If, then, we agree on this point (and I feel confident there can be but one opinion in regard to it), it also follows that this important object in spring management can only be secured at the "expense of honey."

My paper is before an intelligent body of practical bee-keepers, who are cognizant of the fact that tho a hive may be well filled with bees that have come thru the winter safely, and tho there may be a 10-dollar queen in that hive—yes, and tho every other requirement has been successfully met—yet, if there is not a continual supply of honey and larval food, slow progress in brood-rearing must be made in that hive. Not only is it enough to *know* that there is a sufficiency of food, but we should also know that it is in a proper condition, and in a convenient position.

There are invariably days in early spring-time, and sometimes several in succession, when the bees are unable to gather from the outside; and if at such times there

Mr. D. W. Heise.

should be considerable brood in the hive (in different stages of development), I would consider even a liberal quantity of sealed honey in the hive as being in a very improper condition for the most profitable advancement in brood-rearing.

Experienced bee-keepers know well the difference in a colony where the supply of liquid honey surrounding the brood has been continuous, and one where famine has at times existed even with sealed honey in the hive. In the former the larva will be found a pearly white, and fairly swimming in the food that has been supplied them; while in the latter the brood will be found destitute of food, of a deathly yellow color, and destined to develop into a sickly and short-lived generation, if indeed they ever mature, and will be found of very little value as honey-gatherers.

Many experiments have been conducted by men of extensive apicultural knowledge, with the object in view of stimulating the queen to greater activity in egg-production early in the season; and various have been the methods that have been outlined for the accomplishment of this object. But, so far as my limited observations have directed me, I am forced to the conclusion that any manipulation of the brood-chamber that will cause the bees to move their honey from place to place, will bring greater results in *that* direction than anything that has come to my notice. And the uncapping of honey, when such exists in the hive, is, to my mind, one of the very best methods that can be adopted for the enforcement of that object.

It is of course clear to the mind of every bee-keeper

worthy of the name, that there are a great many requirements that must be met for the greatest possible advancement in brood-rearing, apart from keeping up the food supply. But I have a firm conviction that there are a great number of honey-producers who could so vastly improve on their spring management in this direction, that the difference in results when the main honey harvest arrives would be obviously apparent to even the most skeptical.

I would, then, not only advocate the uncapping of honey that may be in the brood-chamber, but I would go further, and say that any bee-keeper who is alive to his own interest, and that of his bees, should always be in such a position that he could at any time supply his colonies with combs of sealed honey (outside of a division-board) after brood-rearing has once commenced, and the sealed honey has been exhausted, or when the bees are prevented from any cause whatever from bringing in a sufficient supply from the fields for the encouragement of the extension of the brood-nest.

Yes, I am persuaded to go still further, and say that in my opinion I would consider it prudence on the part of the honey-producers if they would so manage as to have the dark and inferior honey (a certain amount of which most localities furnish before the white flow sets in) stored in frames of such a size that they could be inserted in the brood-chamber early in the spring of the following year (first uncapping them), for the encouragement of brood-rearing. By this management we not only keep an article off the market which will always have a tendency to injure the reputation of good honey, but we utilize it ourselves, and actually trade it off for bees early in the season, the great advantage of which I am sure no one will for a moment question. By this method we are also able to keep a considerable number of partly worn-out workers in the hive, where they are of immense value in keeping up the required temperature during unpropitious weather, when their lives would be endangered by wandering out, and yet brood-rearing goes on apace.

There is one important point that I wish to refer to, and it is this: Any manipulation in the hive that has for its object the moving of honey by the bees will likely carry with it the spreading of brood to some extent—an operation which the novice will always do well to fight shy of, and one which even the expert will only attempt with caution and the exercise of good judgment; but if it is discreetly entered into, and judiciously carried out, it will result in a manifest advantage to the colony, and the ultimate fattening of the purse of the operator. D. W. HEISE.

Mr. Abbott—There is one idea that Mr. Heise did not emphasize very much, and that is, that an abundance of honey in the hive does not indicate success. A good way to encourage breeding in the spring is to uncap some of the sealed honey in the hive. In some localities it would be disastrous to do so. Even the robins sometimes make mistakes. You see that our Canadian friend has been watching these things. Bees can uncap honey, but it is more difficult than many suppose. They will not work readily on honey that is not uncapped. They will go to work outside first. It shows that they have a dislike to doing it, or it is hard work for them to do it. I believe it pays in the West to see that the bees have plenty of honey. If a horse has plenty of feed upstairs, but has no one to give it to him, what good does it do him? This idea struck me very forcibly.

Mr. Niver—We would like to hear from Mr. Howe, from the buckwheat country. Uncapping honey is too slow for me.

Mr. Howe—We have no trouble with uncapping honey. In the spring we set out hives with honey that is capped, and the bees take care of it. Of course, in a spring like last spring, it was a little difficult. Ordinarily, we have not so much work.

G. W. Bell—When honey is fed in this way, the stronger colonies get the most.

Mr. Abbott—Do you have no flow at all in the early spring?

Mr. Bell—Ask Mr. Howe if his neighbors' bees get any of the honey so fed?

Mr. Niver—I presume they do.

Dr. Mason—I believe Mr. Abbott is right in his idea about the bees uncapping honey, and Mr. Howe is right, too. We do not want to spare honey for the neighbors' bees.

Mr. Niver—We have another practice. Instead of putting honey in the hive we use supers, and put the honey we wish to feed in them.

Mr. Hershiser—I like Mr. Niver's method of stimulating bees better than Mr. Howe's. I don't like to have bees get into the habit of carrying honey away from hives. It teaches them a bad habit.

Mr. Howe—As to teaching bees a bad habit, I think it teaches them a good habit.

Pres. Whitcomb—Do you think the worker-bees ever go to work gathering nectar from flowers after they have learned to rob? I find that they are just like other thieves. They don't do anything else but steal. We have to set a trap and catch them off.

Mr. Howe—I have never had a bit of trouble. We leave a hive standing there, and when they see that it is empty, they go away satisfied.

Pres. Whitcomb—I have no record of a bee reforming after learning to steal.

Mr. Bell—I got a queen from Ohio, and her colony did nothing else but rob as long as the queen lived. When she died I was glad of it.

Mr. Abbott—Let me give an illustration. These large bee-keepers find it hard to know what they lose and what they gain. They don't miss it. So it is with Western corn-growers. That is, there are large and small agencies. A little while before I came away a colony got to robbing. My wife said, "What is the matter?" I went out and found we had accidentally left a comb of honey out. I found what the matter was.

G. B. Hurley—I would be afraid of work like that. I lost a colony of bees just in that way.

Mr. Coggshall—How much more is a frame of brood worth than a frame of honey?

Mr. Hershiser—What do you do with brood?

Mr. Hutchinson—He wants to trade honey for brood.

Pres. Whitecomb—I fail to see the advantages in teaching bees to rob.

Mr. Hutchinson—Won't it have a stimulating effect, going out and bringing in honey?

Pres. Whitecomb—No.

Dr. Mason—I believe it will have a stimulating effect.

Mr. Hershiser—How do you know a robber-bee?

Pres. Whitecomb—By its sleek appearance. It has worn off the hairs.

J. H. M. Cook—It seems to me that we make a sort of mistake. When we put a comb of honey in the hive it does not teach bees to rob, and it is not robbing. When we feed them they get it in the legitimate way. If there were a few bees in there then they might fight, and be taught to fight and rob. I think it is far better to take out the comb. I would rather have a large increase of brood than to have pounds of unused honey in the hive in the spring.

Pres. Whitcomb—But when they take the honey they will go to work and tear the comb down.

Mr. Howe—About separating brood, suppose you separate brood and it comes a cold night. With our method a cold night does not affect it.

Dr. Mason—It does not follow that bees will tear comb down when they take the honey. If the combs of honey are in a hive so closed that but a few bees can go in and out at a time, the combs will not be torn, but if they have free access to them, they are quite sure to injure them badly.

Mr. Hershiser—I think it is a very unwise plan to uncap the comb and set it on the outside.

Dr. Mason—I suppose every intelligent bee-keeper would agree with you there.

Mr. Cook—You should use judgment.

Mr. Danzenbaker—I have listened to the remarks with a great deal of interest. I think the young man is right, and Mr. Coggshall is right. About uncapping, the bees in the neighborhood smell the honey. I merely take a knife and press it on the comb. Such honey is like capital in a bank. In this altitude queens do not begin laying until the middle of March. In feeding bees in the spring, feed unsealed stores. If they have honey in the hive they will use it. I succeeded in having the first swarms in this neighborhood. Mr. Todd had 100 colonies, and fed back honey and lost 90 of them. I don't want to feed bees until plums bloom. I always want a warm day to feed in.

Mr. Wander—How can you do it when the hive is crowded?

Mr. Doolittle—I want to say just a word about putting honey in such a hive. *Don't do it.* Don't do anything; that colony is good enough. My good brother from Kansas is in a starving condition. *These* two are sleek and fat. I want to help *that* brother. *These* that are sleek and fat don't need the help. It teaches them bad habits. But about putting that frame of honey in the center of the brood—I don't care how cold it is if it doesn't last over 48 hours.

Just as quick as the knife is put in that honey what happens? The whole colony is active. At the end of that time, if it does not continue more than 48 hours, you have roused the activity of the bees. You want to do it at the right time. Nothing booms along your business like doing the right thing in the right place and at the right time.

Dr. Mason—Why not let that strong colony do a little more and get a little stronger? Now, if Mr. Doolittle takes a little bigger snit of clothes than other people, why not let him have them? If he fills his clothes full, and they show they are not large enough for comfort, why not let him have larger ones? I believe in expansion. Feed the strong colonies if it will make them still stronger. I never saw a colony too strong during the honey-flow.

Mr. Doolittle—If I have everything I need, is it necessary for me to have more? Bees are like men—they are grasping. The more they have, the more they want. You know which colony needs the feeding. You are the better judge.

Dr. Mason—Mr. Doolittle is making just such statements as we see in the bee-papers. We are talking about those that *do not* have all they need. If bees are like men—if one colony is brighter, more active and energetic than others, and requires more room and more food—why not furnish such colonies with what they need? We are working for best results, and we want strong colonies. The bee-keeper's motto is, "Keep all colonies strong," and the stronger the better for honey gathering.

Mr. Coggs—Mr. Howe is like Mr. Doolittle. When they have no breakfast they want their dinner. So it is with bees.

Mr. Cook—It makes no difference if we can transfer a little brood—we want eggs. It is stimulating brood-rearing, but, of course, it must be done when the weather is warm. We get the bees, and then we can distribute them evenly.

Pres. Whitcomb—That is not the point we were discussing.

Mr. Cook—I don't care where we get the brood. We can strengthen the weak colonies with brood from the strong ones.

Mr. Abbott—Take a knife and cut off the cappings.

Mr. Doolittle—I don't believe you do.

Mr. Cook—I have not been bothered with the honey running when I have shaved off the cappings.

Mr. Doolittle—That is, candied solid, I suppose.

Mr. Cook—No.

Mr. Abbott—I have been shaving for years. We don't roll them to Ohio in the sand.

Dr. Mason—Probably you don't have the "sand." [Laughter.]

Mr. Abbott—We have plenty of "sand."

Mr. Doolittle—What do you do about exposing honey?

Mr. Root—Say "I" when you ask that, Mr. Doolittle.

Mr. Hutchinson—The bees will uncap it quickly enough if you have it out-of-doors. Fussing with this in a large way is no fun.

Mr. Doolittle—There is another point that has not been touched. I have tried out-door feeding for stimulating purposes, and I have become disgusted with it. I fully agree with the president, that if a bee takes evaporated honey that bee will forever be on the go for more. I am a little fellow by the name of Doolittle. I carry a box around for my 260 or 270 pounds to rest upon, and a colony of bees will follow me around for weeks for the honey they smell on that box. When Mr. Hutchinson has filled up with beef-steak he doesn't want much more right away. When you find dollars you will think you can keep finding them and you won't stop to pick up pennies.

Dr. Mason—Feeding in this way does not induce robbing with me. I don't believe the bees know that it is robbing. They have to fight if they rob. Localities differ. New York robber-bees that have gone out to Ohio may be robbers there as they were in New York.

Mr. Hershiser—Do you find it pays to feed?

Dr. Mason—Yes, sir. I don't want it to go out that I recommend putting a frame of honey in the middle of a weak colony.

At the close of the above discussion Mr. Danzenbaker read a paper on

The Best Method of Comb-Honey Production, With Latest Hive Improvements.

This is an important topic, especially for beginners. Space will only permit the merest mention of the essentials of the best method in the order of their importance:

The first is a good field where a full and steady flow of

white honey can be had; where bees can be wintered safely on the summer stands in box-hives, where hives and flying bees are sheltered from cold or violent winds on dry ground, sloping southeastward, that the morning sun may shine in the entrances of the hives.

The second is large, healthy American-bred, pure-Italian queens, without trace or taint of Cyprian, Holy Land or Carniolan stock in their composition; of gentle, docile disposition, safe to handle, and not over a year old; that they may crowd the brood-frames full of eggs without over-swarming, forcing the bees to store their surplus in sections.

The third is a double or thick wall, tight, dry, warm hive, consisting of separate hive-bodies and supers, for tying up to any size desired; to be used on loose hive-bottoms that can be easily cleaned, and afford ample ventilation beneath the brood-frames, the full width at front and rear of the same.

The bodies should be wide enough to hold 10 brood-frames. In no deeper than these can bees build natural combs without the cells stretching out of shape, resulting in sagged, bulging, corrugated or scalloped edges at the bottom where worker-bees are reared.

The last but not least consideration in securing comb honey is strong colonies of bees, old enough to collect the honey at hand. While a small colony of bees in warm weather may fill a small box solid with honey, a larger colony will do much more, proportionately, as they can maintain sufficient heat in the supers to work continuously day and night from first to finish. Sufficient heat has much to do with success or failure in the production of comb honey, as it is as impossible for bees to produce and work wax into cells in cold supers as it would be for their owners to fasten dry stamps on paper. When bait-combs are used in weak colonies, bees may cluster on a few sections, and finish them by forming a wall of bees about them to create sufficient heat.

I have always produced comb honey, and I find that two supers, protected by wrapping up or with an outside case, are as good as three unprotected, and I have never yet seen a super so warm (where the outside air was up in the nineties, in Virginia, North Carolina and South Florida), but that the first finished and handsomest sections were always in the center of the super, and extending outward just in proportion to the strength of the colonies. Sufficient heat has more to do with success or failure than any single thing in the production of comb honey. When we consider that the heat of brood-nest and supers must be maintained continuously in the nineties, we realize the importance of retaining it as much as possible, and the bees instinctively seal air-tight each crack or crevice at the top or sides of their hives to prevent the loss of warm air. Hence, there is a limit, according to the strength of the colony, to the space that can be given them in brood-rearing, lest there should be loss of time, and space filled with excess of pollen, or combs deserted to the wax-moth.

Forty of the strongest colonies of pure Italians I have seen this season wintered safely last winter out-doors in nine closed-end reversible-frame two-story hives, 7 inches deep, with flat covers $\frac{7}{8}$ inch thick, left as sealed down solid by the bees, with dry cork-dust cushions over the cover, with a cap 6 inches deep telescoped over the same. They had plenty of honey, and by swapping and evening up as needed, most of them had three bodies filled with brood and bees ready for clover and basswood. Many of the frames were solid slabs of brood from top to bottom. By shaking most of the bees on one story of brood frames they crowded into the supers and began drawing foundation at once. With no signs of loafing they went to work with the vim of new swarms. The surplus brood was set aside with bees enough to care for it to hatch out and re-inforce the colonies with the supers, when it would do them the most good.

The largest possible yields of comb honey can be had from single colonies by breeding all the bees possible in two stories before the full flow begins, then contracting the brood-nest one-half and reversing one set of frames to force all the bees of a strong colony into one body and super; the latter to be raised up when the bees commence sealing the first cells, and putting on an empty super of sections, with full sheets of foundation in the same beneath them.

It is worse than labor lost to put on sections before the bees are strong enough to fill them, or before the honey-flow begins, with the mistaken idea that they are getting used to them. In a full flow they may refuse to start if the brood-frames are clogged with sealed honey at the top above the brood.

But they can be started at once by exchanging a part

of their full frames for dry combs in the center of the brood-nest, or, better still, by breaking the cappings of the honey and turning it bottom side up where reversible brood-frames are used.

If a flow begins where hives set in couples, and neither colony alone is strong enough to work in supers, the working force of the two may be united and set to work at once, and the extra brood given to other colonies.

When colonies are working in supers during a honey-flow whole supers of young bees and sections can be given to weaker colonies that will start them working with a rush to finish them.

When some supers have sections partly filled with unsealed honey, part of them may be used as starters for other supers.

When a strong colony begins to cap the first set of sections they can be raised up and a second set put under them, when the bees will finish them up while starting in the lower sections; but, if raised too soon, they will not be finished properly. It is safer to crowd all the time, even at the risk of having a few idle bees.

All queens should be elipt when working for comb honey, as the best possible condition for comb honey is just suited to swarming. When eggs are seen in queen-cells, swarming can be controlled by removing two-thirds of the brood, and giving dry combs or empty frames with starters only. The extra brood-combs may be exchanged for inferior or drone-combs. By this plan swarming can be absolutely controlled.

THE LATEST HIVE IMPROVEMENTS.

The woeful waste of bees the past winter has shown more conclusively than anything I can say the decided advantage of closed-end brood-frames, with their combs extending solid to the end-bars, making each comb a compartment similar to combs in box-hives. By personal observation and correspondence from Northern New York, Tennessee, Texas and Florida, I find closed-end frames have wintered bees safer than the open-end frames. When protected with an outer case they have equalled chaff-packet and box hives, even where the cold was 30 degrees below zero. Why should we have hanging frames so handy to handle if they lose half the bees in wintering, so as to be utterly worthless for comb honey?

I have devised a method of supporting brood-frames from the center of the end-bars on solid cleats, that add to the thickness of the hive-wall, and afford a reliable bee-escape, free of cost, that can be utilized if desired.

In working for comb honey I prefer a large brood-nest, like the Dadants, for fall, winter and spring, for keeping and breeding up strong colonies till the harvest. But I don't like their large frames, as I used them eight years in the first hives I ever owned. I prefer the large frame, divided horizontally, about 7 inches deep, that I can contract the brood-space one-half in putting on the supers at the beginning of the honey-flow, when it is most desirable to utilize the bees for surplus rather than in rearing bees to be needless consumers after the harvest.

I prefer a 10-frame body that can be contracted to 8-frames, by placing a solid slab of sealed honey in a closed-end frame on either side, which allows of bees clustering over it to send up heat in the sections above them. I have used one-half-pound sections, two-pound sections, and frames 6 inches deep by 12 inches wide for comb honey, with and without separators; also the so-called Standard $4\frac{1}{4} \times 4\frac{1}{4}$, thick sections in wide frames and T supers. I never liked any of the three, and I rejoice that I have lived to this hour to say that they have had their day, and the tall 4x5 inch, thinner, plain sections have come at last, and are here to stay, and the sooner the Standard bee-writers and supply dealers get themselves in line with this sober, solemn fact the better they are going to feel about it.

I regret exceedingly that some of my good friends are advocating short-weight, ten-penny sections, which can only help the supply manufacturer and the wholesale commission man, who are pushing these small sections, while the producer and consumer will have to pay the piper. In my market the pound sections sell the best, and they can be sold wholesale by the piece by producers that know their business. I have never had to sell my own honey by weight. It requires extra-good seasons to get the smaller sections filled properly, as bees will not work well in a limited space, and the smaller the surface the worse the unsealed cells look, and the grocer will insist on buying them by weight to sell by the piece. As it requires the same handling, and costs as much, for the small sections and foundation, they cost the producer relatively more than the

larger sections, and the sooner producer and consumer call a halt on this small-section folly the better for all concerned.

All 4x5 inch sections made by the A. I. Root Co. for the Danzenbaker supers are full $\frac{3}{8}$ -inch thick, which gives more strength and firmness to the sections when folded. No one will use a thinner section after trying them.

The fence separators for the section supers are one of the best improvements that has been brought out recently, also recommended and used by the late B. Taylor, of Minnesota, 10 or more years ago. The nearer nothing a separator can be the better, if it keeps the queen out of the supers, and the sections straight and uniform in weight. The fences fill the bill fully, and they are bound to "fence in" the whole bee-keeping fraternity, and they, too, are here to stay, altho some of the "big uns" did an awful amount of hard and high kicking at the venturesome fellows who felt pretty hard hit at the time, but are getting ready now to say, "I told you so at first."

One of the best among the latest hive improvements is the section-holder, forming a divisible honey-board or top-less wide-frame, covering three sides of the sections. The edges are covered with the fence cleats, hence they come out as clean as new, ready for the shipping-cases.

The tempered wire springs that are now used in supers, made by the A. I. Root Co., are a valuable improvement over wedges, as they are always in place with a perpetual pressure. The three-piece Danzenbaker cover and bottom will be further improved for the coming season, and are decidedly the best made.

The Danzenbaker hives combine the best features in other hives, with the latest improvements already described.

F. DANZENBAKER.

Mr. Abbott—I did think I would not say anything about this, but I want to give some facts. These things have come to stay. This is a big country. Away out West there is a lot of stock that I want to sell; there is little sale for it. Last year we put in a large stock of supers. I don't believe there is in Missouri 25 percent of closed-end hives. I am astonished to hear that the section-holder is a modern improvement. Twenty-three years ago I bought it and threw it away. I don't know any bee-keeper in Missouri near me who uses it. Some localities use it. When I went to Missouri, 16 years ago, Mr. Armstrong, of Illinois, had a fence separator. (By the way, I have a stock of fence separators to sell.) Mr. Armstrong's separator was the best separator I ever used, but I don't see the need of putting separators in bee-hives. You can put in the sections and give plenty of room. Bees don't like to be disturbed. Men come to me and ask for advice about separators. I say they are useless. For Mr. Danzenbaker it may be all right, but for the majority it is useless. I have in my possession 5,000 pounds of honey, not a single pound of which was produced with separators. You can sell "chunk honey" to good advantage. People will smack their lips and say, "That chunk honey is good."

QUESTION—How do you ship that kind of honey?

Mr. Abbott—I don't ship it. Sell your honey at home.

Mr. Stone—I would like to give Mr. Abbott some idea about the proportion of honey that he would have left on hand if produced without separators. At the World's Fair, out of 2,300 pounds brought us, about 20 pounds of that produced without separators was fit to ship and sell.

Dr. Mason—Mr. Danzenbaker says, "Why have standing frames if it makes the bees die in winter?" It doesn't. Don't make that style of statements. Standing frames *don't* make bees die in winter.

Mr. Danzenbaker—A gentleman talkt to me about my hive. I askt him, "Did you ever use that hive?" He said "No." I sold him that kind of frame, and he found fault because the frames were open. I sold him a Root hive. This man got 50 hives, and he got 50 the year before; colonies on the open frames all wintered safely. Twenty-three colonies on the closed ones died. They are the only ones that I have heard of. He wintered them in Hoffman hives. In closed-end frames there is no circulation around the hive.

Dr. Mason—I understand that Mr. Root has wintered bees in Danzenbaker hives, and 50 percent of the bees died. Is that a fact, Mr. Root?

Mr. Root—It is.

Dr. Mason—But he only had two colonies, and one died. [Laughter.]

[Continued next week.]

The Premiums offered on page 765 are well worth working for. Look at them.

Trouble in Rendering Beeswax.

I have had some trouble in rendering my beeswax this fall. The oftener I boil it the darker it gets, and when I put it in the molds it cracks, is hollow in the center, and sticks to the sides, altho the pans are greast. What is the matter with it?

CALIFORNIA.

ANSWER.—It is probably always the case that the oftener you boil beeswax the darker it gets, and one way to avoid having it so dark is not to boil it so often. There is no need of repeated boilings. You will do well to try a solar wax-extractor. With the glorious sunshine you have in California there is no trouble about getting heat enough. The vessel in which you boil it may have something to do with darkening it. Cooling slowly will help against cracking. The larger the body of wax, the slower the cooling. A lot of water in the vessel with the wax will be much the same as a larger quantity of wax. It may be made to cool more slowly by covering close while cooling, or by putting it in the oven of the stove, with a low fire, letting the fire die out, and not removing the wax till the stove is entirely cold.

Starting with Bees Transferring, Etc.

I am reading the American Bee Journal with great interest. I am glad the editor adopts the new orthography. It shows he believes in progression all around. The good fellowship manifested by bee-keepers with each other makes me like the company.

I have caught the bee-fever. I had 5 colonies in Langstroth hives, the combs, I presume, being somewhat crooked. Being a novice, I did not start them right. I had 6 colonies given me. They were in old boxes and weighed from 53 to 94 pounds each. They did nothing for their owners, of course, because they had no care. I moved them home lately. One colony I had boxed tight for three miles, still the bees are alive. I moved them about 12 miles and they seem to be all right.

1. How can I tell if the queen is alive or not? I had a terrible time moving them. The rotten hives had holes all over them, and I was stung over a hundred times, and was advised seriously by friends to give it up; but never—not I. I washt in soda and salt, and used ammonia, and the stings amounted to nothing.

2. How and when can I transfer the bees—after they swarm or before? and about what time in the spring? I want as large an increase as possible, and I want to introduce good queens. I am handicapt too much at present to make a success. I have to depend on my neighbors to hive the swarms for me. I am working at the State penitentiary, and can only go home on Sundays and nights. My wife is afraid of bees. It seems to me I could just place an old hive of bees on top of a new hive with starters, and stop up the vacant places. After a few days or weeks place a bee-escape between them, and when they all have gone below take off the old hive. If the queen did not go below, so much the better; I could then introduce a new queen; or, if a part of the bees did not go below, I could then divide. We have moderate winters here and do not need to house our bees.

3. Can I have starters in hives a month or two, all ready? Would they become too dusty or harmed in any other way?

4. Can I buy and keep on hand a dozen or more queen-bees, a month or longer, ahead of time, so as to be sure of a good queen in an emergency? On account of freight, etc., hives will cost me considerable, and I believe I can make them cheaper.

5. There are several persons in this part of the country who destroy their bees for the honey. I don't suppose there is any way of saving the bees at this time of the year, is there?

WASHINGTON.

ANSWERS.—You say the bees seem to be all right, from

which it is probable that not many were lost in the hauling, in which case you need have no particular anxiety about the queen. In case of smothering, starvation, etc., she is among the last to succumb. You will do well not to try to find whether the queen is all right at this time of year, when no brood is likely to be present, but wait till brood is present next spring, and then if any colony has no brood at a time when you find brood in all other hives, you may judge that no queen is present.

2. You will probably do well, especially if you have not had much experience, to wait for the bees to swarm. As you are anxious for increase, let the colony swarm as many times as it will, setting the swarms on new stands and leaving the old hive untouched till 21 days after the first swarm, when you can transfer according to the instructions in your text-book. A safer plan will be to set the swarm on the stand of the old colony, putting the old colony close beside the swarm, a week later moving the old colony to a new stand. But this way would give you only one new colony for each old one. It would give you more honey than the first way, however.

As you are not at home to hive swarms, it may be that your plan might suit you better, providing the old hive is not too large. If the comb is not built clear down in the old hive, cut off the lower part of the hive that contains no comb. If that cuts away some empty comb at the lower part it will do no harm. Don't put an escape between the two stories. That might result in starving the brood above. The bees will not use the lower hive till the upper one is crowded, so the less spare room there is above the sooner will they build below. Wait till you find brood, or at least eggs, in the lower hive, and then you can set the old hive on a new stand. It will be better to have full sheets of foundation than starters, for in the latter case you would have too much drone-comb.

3. Yes, you may have it five years ahead. If it gets dusty the bees can clean it off.

4. You cannot keep queens on hand very satisfactorily unless you have at least a nucleus for each queen.

5. It is somewhat doubtful whether you could make use of such bees so late in the year without having frames of honey for them; still, you might give them frames of candy as described in your text-book.

Wax-Moth Killing a Colony Without Injuring the Honey Extracting-Frames.

1. Is the wax-moth poisonous?
2. How can I kill a colony of bees and not spoil the honey?
3. How can I get the extracting-frames cleaned out so that they can be stored away for winter?

MINN.

ANSWERS.—1. The wax-moth is not poisonous, it has no sting, and you need have no fear of its biting you. The only danger from it is the danger of damage done to the combs by its larva, the wax-worm. When in sufficient numbers, these worms will destroy the combs of a colony in a short time.

2. The usual way, and perhaps as good a way as any, is to brimstone the bees. There may be some danger of discoloring the combs of honey, but these are not generally of virgin whiteness in the brood-chamber, and you will hardly notice any discoloration made by the brimstone. You may get what honey there is in the brood-chamber without first killing the bees, by drumming out the bees if a box-hive is in the case, and if it is a movable-comb hive all you have to do is to take out the frames and brush off the bees. Nowadays very few bee-keepers kill bees designedly, altho there may be exceptional cases in which it is profitable to destroy the bees. With the careful study of a good text-book, you will probably find plans by which you will do better than to kill bees.

3. Pile up the supers of extracting-frames some rods distant from the apiary, and give the bees free access to them. That is the best, and probably the only way in which you can have the work thoroly done. Lately, however, it was advised by one of the best European journals—the *Revue Internationale*—not to have the combs cleaned out after the season of extracting was over, but after the last extracting to put them away in their dauby condition. It was said that they will keep in good condition so, and when given to the bees the following season they would be more prompt in filling them. A question might arise, however, whether there would not be danger that honey stored in such combs would not granulate more quickly, as the granules in the cells might favor granulation.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. NOVEMBER 30, 1899. NO. 48.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

A Light Year for Supply-Dealers is prophesied by Gleanings in Bee-Culture. Reasons—heavy losses last winter, general failure of the honey crop, leaving supplies of the previous season still on hand; and discouraging effects of disease in some localities.

Loquacious Paid Writers for the bee-papers are getting some whacks nowadays. The expression "loquacious paid writers" raises several questions. Are all "paid" writers "loquacious?" Are all "loquacious" writers "paid?" Do editors select those whom they pay because of their loquacity? Are they likely to get better service without pay than with it? Is that the general rule in other departments? Are literary, agricultural, and other journals the best that pay the least for their contributions? Referring to this matter, "Somnambulist," the "delightful dreamer" of the Progressive Bee-Keeper, says:

"Allow me, pray you, to ask, if the journals did not employ "loquacious paid writers," where, oh, where, would they secure copy? And does being a paid writer, loquacious or otherwise, exclude one from possessing a few grains of common-sense?"

Selling Honey Outright for Cash is the way for bee-keepers to dispose of their product *when they can*. Says F. L. Thompson in the Progressive Bee-Keeper:

"The last two years a buyer has come to this county and cleaned up the product, shipping the honey himself, and paying cash for the honey when delivered at the car. The advantages of such a plan are considerable to all concerned. No leakage, no drayage, no commission, no wait-

ing, no misunderstanding; the buyer knows what he is doing, and the producers know what they are doing. The firms who buy in that manner ought to be given every encouragement, so that this method of purchase may eventually become the rule and not the exception. It tends to place honey on the footing of a staple, like cotton or potatoes, which are largely bought in the same way."

Mr. Thompson is sound in his views, and the bee-keeper who compares the present year with the few years immediately preceding will see cause for encouragement that he will hereafter have no need of the services of the commission man. But we may as well open our eyes to the fact that the supply of honey this year is probably smaller than it has been within the present generation. In proportion as the crop is scanty, commission men are forced to buy for cash or not handle the goods. So the unusual scarcity has brought into the field an unusual number of buyers, and unless the future is different from the past, the next season of big crops will see many of the cash buyers of this year drop back into the commission ranks.

After all, much lies in the power of bee-keepers, and if all hold back for cash sales they can get them.

The Bee as a Fertilizer Appreciated.—It is pleasant to note that in many quarters, even in the religious week-lies, the bee is beginning to be appreciated as something more than a mere honey-gatherer and stinger. Barring the error as to the sex of the bees that do the gathering, here is something good from the pen of the Rev. Geo. A. Little, in the Herald and Presbyter:

This spring, having a little ground, I determined to renew my youth by having a garden. A neighbor said to me: "No use to plant cucumbers." "Why?" I askt. "Are not the soil and the season favorable?" "Soil and season are all right, but there are no bees. You will have vines and blossoms, but no cucumbers." I caught the idea. These little insects, going from flower to flower and wallowing in them, get on their legs and bodies more or less of the pollen, and thus fructify the blossom. That was the idea. I knew this to be true of the bumble-bee and the red clover. The farmer needs, in order to raise clover seed, clover blossoms and bumble-bees.

I planted the seed and watcht for the honey-bees. There was white clover on the lawn, but up to the middle of June I had seen but one honey-bee, tho I had an eye wide open for them. The yellow blossoms were on the vines, and yet not a bee. But on Sunday one came and found his job. Monday he was on hand again. Then finding himself over-matched, he brought a mate, and now a half dozen can be seen at almost any hour of the day, "busy as bees."

And with that for a text, Mr. Little preaches a sermon—and a very good sermon, too.

Bee-Supplies for 1900.—Only a few changes are announced in Gleanings in Bee-Culture. One is the combination of stand and bottom-board in one—a thing that may be liked by some whose bees stand year in and year out without moving.

Another of very much more importance is in hive-covers. In the Higginsville cover and others of that kind, a central piece something after the nature of a ridgepole covered the joint of the two principal pieces of the cover, and in very dry climates there is a chance that the wood might shrink so much as to let the water in. The new cover "consists of three pieces as before, and two end cleats; but the center or gable piece is channeled out on the under side to correspond with the projections on the edges of the two side-pieces that come together. The principle of this is a good deal like old Higginsville, with this addition—that the two side or gable pieces have perpendicular shoulders, and the ridge-piece is channeled so as to straddle over these two shoulders, leaving *perpendicular* edges of contact, rendering it impossible for the water to work its

way up hill and finally into the cracks between the two boards."

The Cowan extractor has its inside work made lighter and at the same time stronger. The reels of the two-frame Cowan instead of being made of several pieces riveted together will be made of one piece.

Grading Honey a Matter of Locality.—Notwithstanding the effort to establish a system of grading to apply to the whole country, various methods of grading are in operation, and it seems that not only may each buyer or seller establish his own system of grading, but may also change it from year to year. The following by F. L. Thompson, in the *Progressive Bee-Keeper*, is to the point:

"The buyer last year made a distinction between white and amber honey, and paid less for the latter; this year he dropt that standard entirely, and called all white comb No. 1, and stained or water-colored No. 2. In fact, the color of the cappings seemed to be almost the only thing determining the grade. We have no dark honey. Then, too, he even put sections in the first grade that were not quite finishd, providing the comb was white, in flat opposition to the Colorado grading rules. Color of cappings is something very difficult to describe, and the only way is to have sample sections to go by."

Bees in War.—Mr. W. C. Wells, of Ontario, Canada, writing for the *Canadian Bee Journal*, gives his experience with a peddler and a colony of bees in a little "war" of his own:

We have heard so much about bees being used in war for the transmission of letters, etc., that your readers may be interested in hearing of a true story as to the use of bees in war.

A Dutch peddler and I had quite a time. He was buying old brass and rubber shoes. I wanted to sell him some brass, and when it was weighed out it came to 75 cents. Then he wanted to pay me in truck out of his pack. I told him I wanted cash. He said he did not pay cash, but I said he could not have it unless he paid cash. Then he offered me 40 cents, then 50 cents, and I finally said I would not let it go at any price. Then he wanted 50 cents pay for his time, to which I objected. He said he would not leave until he got his pay, and he would charge \$3 per day for what time he stayed. I ordered him out of the house, but he said he would not go until I paid him, and he said he would thrash me, and he used very abusive language for half an hour.

Well, I did not know how to get him out, as he was a big, stout man, and I nearly 73 years old, I was no match for him. All at once I thought of trying if the bees could persuade him to leave. Quick as thought I stepped out of the back door and snatch up a hive of bees and brought them in. I opened the hive and took out a frame of bees, and in less than no time the peddler was tearing down the road, and I after him with the bees, but he was too quick for me.

I have laughed every time I think of that scene; it was my first fight, and I came off victorious.

"The Honey-Makers."—In ancient times the bee was an important factor in the everyday life of the family, because honey then played the same large part in the housewife's economy that sugar does now. Literature is filled with the honey-bee and its incomparable gift, which appears now as ambrosia, now as nectar; and always as the synonym of sweetness unsurpassd.

The Vedic poets sang of honey and the dawn at the same moment, and all the succeeding generations of India have chanted honey and the bee into their mythologies, their religions and their loves. The philosophers and poets of Greece immortalized the bee. The Latin writers studied it not only for its usefulness as a honey-producer, but also for its unique character; for industry, its skill as a builder, and for its wonderful sagacity in social organization.

These and many more interesting facts are told us by Margaret Warner Morley in her new book, "The Honey-Makers." The author first treats of the structure and habits of the bee, and then of its place in song and homily. Nearly one-half of the volume of over 400 pages is given up

to the literature and history of the bee, and the author has carefully sifted for her purpose the writings of the Hindus of Egypt and the East, of Greece and Italy, of Christian and mediæval times. One is amazed at the largeness of the role which the bee has played in the thought of ancient peoples. Other chapters treat of curious customs and beliefs in connection with bees, and the state of bee-culture at the present.

The postpaid price of this captivating book is \$1.50; or we will club it with the *Bee Journal* for one year—both for only \$2.25; or we will mail it free as a premium to any one sending us *four new* subscribers to the *Bee Journal* with \$4.00. It is an intensely interesting volume, and should be in the library of every bee-keeper who wishes to know all there is known about the bee both in ancient and modern times. It would make a fine Holiday gift.

The Weekly Budget

SPEAKING OF THE SELSER FAMILY, the editor of *Gleanings in Bee-Culture* quotes from this journal an item about Mrs. Selser as an expert honey-bottle labeler, and then says:

"It is a little risky to say something nice of another man's wife; but I will say this much: Those of us who had the honor and privilege of being entertained at Mr. Selser's home, realized that his 'better half' is not only a queen in a bee-keeper's home, but a royal entertainer."

MISS "FLODY," the young lady who was Mr. J. A. Golden's expert assistant the past few years in his work with the bees, was married Oct. 29, 1899, to Mr. Wm. McConnell, a highly esteemed young dry goods merchant. Our readers will remember "Flody" as the one shown in the *American Bee Journal* as the operator of a section-cleaning machine.

'Tis said, "Where there's a *Will* there's a way." We wish her and her "Will" a long and happy way thru life.

DR. A. B. MASON, of Lucas Co., Ohio, writing us Nov. 18, said:

"We've had a splendid warm autumn, and it is still warm. Last night we put our bees into the cellar, with the thermometer at 50 degrees, and when I got up this morning it was 54 degrees, and now at 10:30 a.m. it is 65 degrees."

In the same letter, Dr. M. said that he and Mrs. Mason were that day celebrating their 41st wedding anniversary, and the Doctor's 66th birthday, with a nice dinner, and wishd we could be there, too. We appreciated the invitation, even if it was received several days after the event took place. But as the Doctor express his regret for the delay in inviting us, we'll forgive him this time if he'll promise not to do it again. We wish both Mrs. and Dr. M. many happy returns of the "two days in one."

THE CANADIAN BEE JOURNAL has for some time had no name as editor at its mast-head, but has now secured W. J. Craig as editor. There has been some discussion as to whether the Ontario Bee-Keepers' Association should not obtain full control of the journal, but its members are divided in their opinions. Whatever may be the performance of Mr. Craig as editor, here's a part of his salutatory that has a good ring to it:

"We want our bee-keeping friends to understand right now that the *Canadian Bee Journal* will be largely what they make it.

"Some one has spoken about taking the journal out of the hands of people having 'axes to grind.' Mr. Yeigh has replied on behalf of the company. As for the editor, he hasn't got an 'axe,' and would at this juncture suggest a wholesale burying of axes, hatchets, and everything of the sort, and let us begin at the coming convention 'a long pull, and a strong pull, and a pull altogether.'"

Do you want a Good Market for your Crop of Honey,

BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

We deal almost exclusively in honey, giving it our closest attention all the year round.

We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.

We are acquainted with the most desirable trade thruout the country, and know exactly what their wants are.

We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.

We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.

Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?

We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.

If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.

We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

Glass Honey-Jars!

We have two sizes of clear, flint-glass Jars, No. 1 holding a scant pound of honey, with an opal or white top held on with a screw metal band under which is a rubber to prevent leakage. No. 2 is a rather tall flint-glass jar with tin screw-cap, holding $\frac{3}{4}$ pound of honey. Both are excellent for retail honey-packages, and are put up in single gross lots. The prices are per gross, f.o.b. Chicago, for the No. 1 jars, \$5.25; for the No. 2, \$4.25.

We can fill orders promptly for these jars. They give excellent satisfaction, we know, for we have used the same jars for several years.

because they are strong, vigorous, healthy and will breed healthy stock. All the stock we ship is from bred. We have the largest pure-bred poultry farm in the North-west. Our non-moth poultry produce eggs all and tells HOW TO MAKE THE MONEY WITH POULTRY. Best and latest book out. Worth \$1.00, but sent postpaid for 50c.

John Bauscher, Jr., Box 94, Freeport, Ill.

42E13t Mention the American Bee Journal.

In Nailing Frames, if they are inclined to split, dip the ends a short time in hot water. This will not only prevent splitting, but the moisture will rust the nails and make them hold more firmly.—Centralblatt.

The Cure of Foul Brood by Drugs finds no great favor in this country, altho reports of cures thereby find place from time to time in foreign journals. In Revue Internationale one writer strongly commends the use of formaline, while another claims success in mild cases by using smoke alone. He smokes the infected colony three times a week, blowing 30 to 50 blasts of smoke into the hive.

Outlet for Fermented Honey.—Chalon Fowls, the man who got up so many cooking recipes, says that honey partly fermented is the very best for cooking purposes. Indeed, some bakers endeavor to get their honey into a ferment before they use it. Here is a hint for beekeepers who may have honey on hand otherwise good but a little fermented. There is hardly a doubt that many a baking concern will take honey fermented, even in large lots.—Gleanings.

Simmins on Foul Brood.—S. Simmins, editor of the English journal Bee-Chat, asserts that under normal conditions, except when swarming, or when frightened so as to fill up on honey, a bee from a colony affected with foul brood going from its own hive to a hive with a healthy colony, never carries the disease with it. In proof of

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

Bee-Keeping in Colorado.

It is generally conceded that Colorado is one of the leading honey-producing States, and the opinions of its bee-keepers should have weight alike with bee-editors and supply-dealers. Realizing this, Editor E. R. Root is now attending the annual Colorado Bee-Keepers' Convention, at Denver, to become better acquainted with the Western bee-keepers and their methods. The readers of *Gleanings in Bee-Culture* will get the benefit of this in forthcoming issues. He has with him, of course, his camera, so as to present to our subscribers views of the West as he saw them. The first installment of these writings may be expected in our Dec. 15th issue.

Other Leading Bee-Keepers.

Gleanings in Bee-Culture Oct. 15th contained a biographical sketch of the most extensive bee-keeper in the world, Capt. J. E. Hetherington. This is followed in Dec. 1st issue by biographical sketches, with portraits, of the Coggs-halls, David and W. L. In this article will be a discussion of the 4-frame non-reversible extractor, with which Mr. W. L. Coggs-hall and his "lightning operators" have made such phenomenal records. Special features of Dec. 15th issue will be given in this column next week.

Our rates for *Gleanings in Bee-Culture* are:

A Stinging Revenge.

"The Value of Illustrations."

This is the subject of an editorial in a recent issue of *Gleanings in Bee-Culture*, in which appears this sentence:

"We realize the fact that it takes time to read, and where we can give information by pictures, we will illustrate regardless of expense."

In the same number that contained the above, there was also the illustration shown herewith, which *Gleanings* has kindly loaned us for this occasion. We wanted it for two reasons, viz: 1st, for the genuine amusement which it will furnish our readers; and, 2nd, that we might give a sample of the class of pictures some excellent papers use to save the time of their readers, for doesn't Editor Root say "it takes time to read?" and, he also says that where they can "give information by pictures," they will use them, no matter if it "busts" the bank! Just think of the time it would take to read all about the exciting things this illustration shows at a glance—or say seven glances! Then, consider the vast amount of boiled-down information these graphic pictures furnish in so small a space!

P. S.—We presume we really ought to beg Editor Root's pardon for the above, but it seemed too good a chance to get off a harmless joke on him to let it pass by. To show our willingness to let him have "sweet revenge" on us, we will say that he can at any time return in kind—but remember, we don't advise the "stinging revenge" kind.

this he took a strong colony that was badly diseased and put it on the stand of a colony that was not strong but was healthy, putting the healthy colony on the stand of the diseased one. Altho most of the bees from the diseased colony entered the healthy one, this latter remained perfectly healthy. But he emphasizes the fact that in this experiment the bees were not first smoked or in any way intimidated.

Room Needed for Evaporation.

—Leon Dufour, in *L'Apiculteur*, makes a plea for large hives and plenty of surplus room on a ground that is perhaps not always considered. The more the nectar can be spread out in the combs the more rapid can evaporation take place. If a strong colony has only two combs in which to store, those two combs may hold more than can be stored in a day; but evaporation would take place more rapidly if the same plunder were distributed over ten combs, and the bees thus aided in their work.

Selection in Breeding seems to be getting unusual attention nowadays in the Bee-Keepers' Review, and this time it is selection for quality rather than for color. Editor Hutchinson quotes Dr. Miller as saying that if we mark on each super the number of the colony from which it was taken, we may know where to replace next spring a queen whose workers produced

greasy looking sections, and thinks there are other points that might well be looked after. Dr. Whiting found a colony that built but little brace-comb. Requeening his apiary from the queen of this colony, he was practically rid of the brace-comb nuisance. Mr. H. thinks this the right kind of work for those with few colonies; those with large numbers having more profitable work to do.

Packing for Out-Door Wintering.—A good many questions are asked by our subscribers as to what kind of packing is best for out-door wintering. We formerly thought there was nothing equal to good dry wheat chaff. While this is perhaps the best, it is not always available. We have used with equally good results common shavings, such as one can get at the planing mill. Dry forest leaves, if enough of them are used, are also good. Sawdust and clover chaff make a packing material a little heavy, and is liable to become pretty damp in the spring, and too moist for the cluster. The best packing material is that which is loose enough so the air can pass thru it, carrying with it the moisture.—Gleanings.

Honey-Packages are again discussed in Gleanings. "The American Tramp" pleads the cause of kegs. The honey-gates that may be had with tin cans be considered practically useless, for the honey, if of proper thickness, will be too slow in running out. An objection to the tin can is that unless thoroly cleaned and dried as soon as empty, the little honey left in it will turn black and leave a peculiar scent that cannot be removed. What he thinks would make the best package is a wood-fiber or paper package, with no staves or hoops, but all in one piece. The editor replies that while kegs may be more convenient for the seller, tin cans are better for the buyer. He approves of the wood-fiber or paper package if it could be found at a sufficiently low price.

Doolittle Cell-Building.—A picture appears in Gleanings showing queen-cells from which the queens had emerged. They were the product of W. H. Fridgen. In one case the whole 18 cells were completed by black bees over a young queen; in the other case 15 of the 18 were completed over an old three-banded queen mated with a golden drone. June 21 he gave to bees without unsealed brood a comb of eggs with not more than half a dozen larvæ with food around them to be seen. The next day many larvæ were abundantly supplied with milk. At 10 a.m.

and the Clipping Device. Address,

GEORGE W. YORK & COMPANY, 118 Michigan St., Chicago, ILL.

that day, from combs over an excluder having brood in all stages, he shook the bees into a hive with combs of pollen and unsealed honey, confining them with a screen. About 3 p.m. the prepared cups were given, and the next morning they were put in upper stories over laying queens (over excluders), and the queenless bees allowed to return to their home. He cannot get fine cells with larvæ much over one day old. His best queens emerge in 11½ to 12 days. For the first day, queenless bees will do as much at feeding and cell-building as will be done over an excluder in two days, but in the home-stretch the bees over the excluder are ahead.

Foul Brood Cured Without Destroying Combs.—In Bee-Chat, Editor Simmins reports the case of a colony with a native queen which was badly diseased with foul brood, and says:

"At the middle of a warm day the hive was lightly smoked and the queen removed, so that she might be left in a clean hive on the old stand, with foundation in the frames, to collect the flying bees. They were given one frame of healthy capped brood as well, while the original hive of combs was removed to some distance. The young bees in the latter were without a fertile queen for some three weeks, by which time they had a Carniolan laying, from a queen-cell given them. In the interval, honey coming in rapidly, the whole of the diseased matter was cleaned out by the young bees; and after the young queen started laying everything continued so satisfactory and perfectly clean that another division of the colony was made in July. The first swarm continued to build up nicely, and no sign of disease was at any time evident. Turning a diseased colony into three strong and healthy colonies was certainly better than destruction.

"This is only one example of others that were treated in precisely the same way, making healthy increase instead of destroying the original; but it must be borne in mind that no bees were shaken from the combs, the whole hive was removed with as little disturbance as possible, the operations were carried out with the colonies before they were allowed to become seriously depopulated; the time was favorable for swarming and rapid honey-gathering; lastly, but almost more important than all, there remains the fact that the diseased combs were covered with none but young bees, and these, being queenless for a period, cleaned out every vestige of the disease before the young queen again made up a brood-nest.

"Make a note of this last fact in big cap-

Langstroth on... The Honey-Bee

Revised by Dadant—1890 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$2.00. But, as a **SPECIAL OFFER**, and only until next Jan. 1, we will mail this book for only 75 cents provided you send enough on your Bee Journal subscription to pay all arrearages and to the end of 1900. Those having already paid their Bee Journal subscription to the end of this year, need send only \$1.75 for the book and the Journal for 1900. This is a splendid chance to get a grand bee-book for a very little money.

ADDRESS,

George W. York & Co.

118 Michigan St., - CHICAGO, ILL.

ital letters, for we have never known bees (with a virgin queen), when fairly numerous, to refuse to clear out all evidence of disease during the active season of honey-gathering."

A Good Report for 1899.

The past season opened with the best of prospects, and the bees were making preparations for swarming, when behold! a heavy frost killed the blossoms, and set back swarming—the bees killing off every drone. But when Alsike clover opened, they made up for lost time, giving nearly 100 pounds of nice white honey per colony. That was about all I got, for the drouth and heavy early frosts hnisht the fall flow, the bees getting hardly enough to winter on. My crop is 3 000 pounds from 35 colonies, and increasing to 56.

I. D. BARTLETT.
Charlevoix Co., Mich., Nov. 20.

Lost All Last Winter.

I lost all my bees last winter—19 colonies—and got about 200 pounds of honey from two colonies that I bought in the spring, and increast them to ten. I did not get any surplus honey the past fall. But I am not discouraged, as I like to handle bees.

R. H. BERGFELD.
Hardin Co., Iowa, Nov. 20.

A Poor Year for Honey.

This has been a poor year for honey in my locality, having taken but six pounds from 11 colonies, but I did not have to feed any. This is my second year in bee-keeping and I hope, with the help of the American Bee Journal, and the ABC of Bee-Culture, to make a success of the business.

T. L. POWERS.
Alleghany Co., N. Y., Nov. 19.

Poorest Season Known.

Failure is the one word in use among bee-keepers throuth this section in regard to the product from the apiary, and by far the poorest season ever known. However, we are blest by our bees having winter stores without feeding. I am hoping for the prosperity of the apiarist in 1900, following in the wake of prosperity of other industries throuth our land, and wish the Editor of the American Bee Journal a pleasant closing of 1899, and a busy and prosperous entry of 1900, soon to be ushered in.

J. S. HARTZELL.
Somerset Co., Pa., Nov. 20.

Three Successive Failures.

My honey crop was a sad failure for 1897, 1898 and 1899—three short crops in succession—only 600 pounds of comb honey and 100 pounds of extracted from 75 colonies. First it was too wet and then too dry.

D. F. BLIGHTON.
Fulton Co., N. Y., Nov. 16.

A First Season's Experience.

This was my first season as a bee-keeper, and I like the business very much, but I would not care to keep bees (if I could) without the American Bee Journal. I take five other papers (not all bee-papers), but I like the Bee Journal the best.

There was a fair fall crop of honey here from heartsease—no clover or basswood honey. Nice comb honey brought 15 cents very readily.

I started with one colony, and bought three swarms in May and June, increast them to eight, and got 170 pounds of comb

HATCH with the perfect, self-regulating, lowest priced first class hatcher—the **EXCELSIOR Incubator**

Hatches the largest per cent. of fertile eggs at the lowest cost.

Geo. H. STABLE, Quincy, Ill.

HOW TO GET THE MOST EGGS

is the question that confronts the poultryman. Particularly is this true in the winter when eggs are scarce and high in price. Experienced poultry people have solved the problem to their entire satisfaction and profit. They feed the hens Green Cut Bone prepared with **MANN'S NEW BONE CUTTER** and thereby get double the eggs. Cut all kinds of bone and adhering meat and cartilage fast, fine and easy and without choking. Add **MANN'S CLOVER CUTTERS** Mann's Granite Crystal Grit and Swinging Feed Trays and you can't help but succeed. Write now for our FREE illustrated catalogue.

honey, in tall sections, 3 $\frac{3}{4}$ x5. The bees have plenty for winter, if 8-frame hives will hold enough.

I was just going to ask a question, but upon picking up the Bee Journal of March 9, 1899, I found Dr. Miller had answered it.

GEO. A. OHMERT.

Dubuque Co., Iowa, Nov. 20.

An Old Bee-Keeper.

I have been more or less in the bee-business since 1849. In moving several times I sold my bees, but now I have a new supply again. I cannot afford to stay out of the bee-business, nor do without the Bee Journal.

I have a new machine to fold sections. I set it on the table, and can fold them as fast as I can handle them—no breaking.

Darke Co., Ohio, Nov. 18. H. BLACK.

Hard On California Bee-Keepers.

We California bee-keepers have a hard time of it. We have had two seasons of failure in succession, and the coming season is not promising. We have lost all our work and 50 percent of the bees, and have the expense of feeding the balance. Last season they stored a little surplus honey, but it will take all that, and perhaps more, to carry them thru the winter. I estimate that by the time the next season opens, taking in the last two seasons, 70 percent of the bees in Southern California will have perished. We bee-keepers had to hustle around to get other jobs in order to make a living.

C. B. SCHROCK. Riverside Co., Calif., Nov. 14.

Bees in the Cellar.

The American Bee Journal is all right. We have just put all our bees into the cellar. We had three inches of snow yesterday morning, but each one of our hives has a good-sized cover over all to keep off the sun and storm, so they were just as dry as before the storm.

Miss MYRA SNYDER. Ulster Co., N. Y., Nov. 16.

More than Enough for Wintering.

My bees brought in honey during September and October—honey from white sweet clover and buckwheat, enough for wintering and for family use.

CONRAD DIPPEL. Jefferson Co., Wis., Nov. 18.

No Honey This Year.

Our bees did not produce any honey this season, and a great many colonies were entirely lost in August; they are mostly all very light in bees to go into winter.

J. V. HINCHMAN, M. D. Thayer Co., Nebr., Nov. 15.

Euphorbia—Is It a New Plant?

A neighbor of mine recently called my attention to the honey-producing qualities of a plant called "Euphorbia," which his wife was raising for the seed, which she sells to florists, as it is a very ornamental plant and will remain fresh for a long time if kept moist; some branches, with flowers, that I broke off about four weeks ago and placed in water continued to yield honey for a whole week, and are yet fresh and green.

The flowers are very peculiar. There are no petals, but the leaves which surround them are either entirely or partly colored a bright red. The first appearance of a flower is a small knob about the size of a grain of wheat, on the side of which is attached an oval-shaped cup in which the nectar is secreted. At the end of the knob appear the stamens and pistils, and later a pod attach to a short stem and containing three seeds. When ripe, the pod bursts, and throws the seeds sometimes a rod or two. The bees revel on the blossoms from morning till night, and in this locality

from July till frost, which usually comes about the last of November.

The plant seems to be easily raised, and is almost as succulent as cabbage, being greedily eaten by cows and other animals. It seems, at present, to be very rare, and I thought it would be well to bring it to the notice of bee-keepers, as it seems quite likely to prove valuable as a honey-plant, especially in the South, as well as useful for other purposes.

My neighbor informs me that there are two varieties of euphorbia—the red and the white—he has the red. The red is at present quite costly, about \$10 a pound, and not much to be had at that price. I think that only a few of the florists keep it or know of it. If any one else has any further knowledge of this plant, I, for one, would like to hear from him thru the American Bee Journal.

T. W. LIVINGSTON.
Sumter Co., Ga., Nov. 13.

[We should be pleased to publish any further information concerning the plant mentioned by Mr. Livingston.—EDITOR.]

The Successful Carving On of the modern farm requires the utilization to the fullest extent of all its products. In order to make the most of farm possibilities, it is necessary to have modern machinery, not only in the grain-field, in the barn, and in the house, but also in the poultry department. Here we find incubators to have become a necessity, and the only question which the farmer now asks is as to the machine which will do him the best service at the most reasonable price. In this connection we wish to mention the Successful Incubators and Brooders made by the Des Moines Incubator Co., of Des Moines, Iowa, whose advertisement will be found in another column of this paper. Brooders of all sizes are also made and sold at reasonable prices. The new 1900 catalog which has just been issued is a very complete affair in all its departments. It describes and illustrates every machine sold by this company, and does it so well that the buyer can make his selection with almost the same certainty as if he had the machines before him. It also contains the usual proportion of valuable poultry reading. We advise every reader of this paper to send for it. It costs 6 cents. Address the Des Moines Incubator Co., box 78, Des Moines, Iowa, and kindly mention the American Bee Journal when ordering.

Convention Notice.

The Novelty Pocket-Knife

(A heavier and strouger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.]

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Nov. 24.—There is a firm tone in all kinds of honey, even buckwheat sells easier than of yore. 1bc is obtainable for the best white comb which we class as fancy, and 15c for No. 1 grade; stained and off grades of white, 13@14c; amber, 10@12c; and dark to buckwheat, 9@10c. Extracted white clover and basswood, 8@9c; amber, 7@8c; dark, 6@7c. Beeswax, 27c. R. A. BURNETT & Co.

CINCINNATI, Nov. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8 1/2c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth.

KANSAS CITY, Nov. 9.—We quote No. 1 white comb, 13 1/2@14c; No. 2, 13@13 1/2c; No. 1 amber, 13@13 1/2c; No. 2, 12@13c. Extracted, white, 7 1/2@8c; amber, 7@7 1/2c; dark, 5 1/2@6c. Beeswax, 26@27c. C. C. CLEMONS & Co.

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8 1/2c; light amber, 8c; white clover and basswood, 8c; amber, 7 1/2c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7 1/2c per pound; other grades, as to quality, from 7@ to 7 1/2c gallon. Beeswax quiet at 26@27c. HILDRETH & SEGELKEN.

BUFFALO, Nov. 6.—Actual supplies in Buffalo are smallest for several seasons at this date. Strictly fancy 1-lb. comb, active, 15c; No. 1 and choice, 13@14c; dark, buckwheat, etc., 8@12c, as to grade. Beeswax, 27@28c. BATTERSON & Co.

SAN FRANCISCO, Nov. 8.—White comb, 11 1/2@12 1/2c; amber, 8@10c. Extracted, white, 7 1/2@8c; light amber, 7@7 1/2c; amber, 5@5 1/2c; Beeswax, 26@27c.

BOSTON, Nov. 7.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

We are pleased to note that our market continues in splendid condition. While the supply is light, yet, owing to the high prices, it seems to be quite equal to the demand. Later on when the trade realizes the shortage more thoroly the demand undoubtedly will be much better. BLAKE, SCOTT & LEE.

ALBANY, Nov. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6 1/2@7c; dark, 6. Beeswax, 26@28c. MACDOUGAL & Co. Successors to Chas. McCulloch & Co.

OMAHA, Nov. 18.—The November trade has up to the present not been as good as was expected, and shows a falling off from October. It seems that the somewhat higher prices of this fall are affecting the consumptive demand to some extent, still the warm weather yet prevailing in this part of the country may also be partly responsible for it. While trade has been light, prices have been well maintained, nobody being burdened with stock to such an amount as to become oppressive. Fancy white still going at 14@14 1/2c, and light amber 1 cent less. Extracted, white, 8@8 1/2c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8 1/2c. Beeswax, 23@24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity. R. A. BURNETT & CO., 33A13t 163 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery. C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth, 40A1t 2140-48 Central Ave., Cincinnati, O.

No. 49.

CONTRIBUTED ARTICLES

A Nebraska Apiary and Its "Boss."

THE picture of my spairy sent herewith was taken last June. The "old man" in the foreground, with hat in one hand and smoker in the other, is the Boss (that's I). The corner of the building to the right is the corner of the shop and honey-house. The low shed building at the right in the background is where I store bees for winter. It fronts south, and holds one row of hives. I set the hives about three inches apart, and pack short hay or straw all around and over them. The front is closed, all except three inches at the bottom.

In preparing for winter I first take the sections out of the supers, and have boards cut to fit down on the brood-frames, nail cleats on the ends of the bottom for a bee-space above the frames, and bore 15 to 20 holes thru the board for ventilation, and for moisture to pass thru. I pack the super with a chaff-cushion, pieces of old quilts, or anything of the kind at hand, and have no trouble with bees freezing.

The trees shown are cherry, crab-apple and apricot. There is a large orchard west and north of the yard, and dwelling and other buildings south and east. The picture

does not show all the hives, several being hid by the shrub on the left.

My bees increase from 13 colonies, spring count, to 32, by natural swarming. During fruit-bloom and first crop of alfalfa they did well. The second crop of alfalfa was spoiled by the cabbage butterfly, and dry, windy weather almost ruined the fall pasture, so I will have but little honey to sell this year. It is selling at 12½ cents per section.

I should have stated that all but the hive in front stand in three rows, running north and south. The picture was taken from the southeast.

I hope for a better season next year, and the continued prosperity of the "Old Reliable." I. H. PAGE.

The Outdoor Wintering of Bees.

BY F. A. SNELL.

TO winter our bees with any great degree of certainty good protection must be given in our Northern States. In mild winters like we have had the few years past, bees will winter with some degree of success, but the wise bee-keeper will trust to no such way of doing business, as it is very risky, and more food will be consumed than when the bees are kept warm and comfortable at all times, which can only be the case when the bees are well packed with some warm material, as wheat, oat, buckwheat, or clover chaff, or planer-shavings. When thus packed with any of them on all sides, and on top, with a little upward ventilation given to the hives, the bees should winter well, where good stores are at hand, and a good supply of young bees

Mr. I. H. Page and his Apiary, in Thayer County, Nebraska.

are reared in the early fall so the colonies are composed largely of bees reared during September and early October.

For many years I have packed about 40 colonies each fall to winter out-of-doors. Of course, different methods have been tried with varied successes and failures. The new ways were tried with a few colonies only, as I have held fast in the main to that which had proven good, until I found something which proved better after a trial of at least three winters, knowing that one winter only is a very slight test of any method.

One experiment made some 25 years ago with three colonies proved a perfect failure, as the bees all perished before warm spring weather came.

It is said with much truth that we often learn more from our failures than from our successes. I know this was a good lesson to me, and has been kept well in my mind ever since.

I have a shed 80 feet in length, 2½ in width, and 2½ high at the eaves. Posts are set 8 feet apart, to which the front, back and roof joists are fastened. The front and back are of shiplap lumber, so fastened as to exclude all storms. The roof is made of wide boards of good quality, which should be kept well painted to exclude all storms. These roof-boards, as well as front and back boards, are 16 feet long, running lengthwise of the bee-shed or house, as one pleases to style it.

A rack made of 16 feet fence-boards with cross-pieces 4 feet apart, into which nails are driven thru the fence-boards, afford strong stands upon which the colonies stand during winter. During summer I have a row of hives standing about two feet from this shed and in front of it. The shed or bee-house faces the south, so the bees may get the benefit of the sun when flying from their hives during winter.

In placing the bees for winter, the front and roof are easily removed. The chaff packing is thrown over onto the roof at the north side of the shed. The hives are then set on the rack in the shed, a few at a time, or all, as preferred by the apiarist. I usually put in one length, and then fasten on the front to the shed; next pack the chaff in front, between, and at the back of the hives. A frame covered with wire-screen is placed on top of the brood-chamber over the top-bars, and chaff packed on top of the hives and solid up to the roof of the house, which is then placed on for winter, excluding all storms.

The next length of the house is then filled, setting the hives near the shed back of where they were during the summer, and bring other hives from any near-by part of the yard to fill up all the available space in the house. The work is continued until the space is filled, and closed up for winter.

A passage-way is given the bees over the top-bars, under the screen; the latter excludes all mice, and permits the moisture from the bees to pass off, leaving the hives and combs dry, and at the same time retaining the heat of the bees mostly within the hives. Too much importance cannot be put on keeping the bees, hives, combs and food dry and warm during winter.

An entrance-way is given the bees to and from the hive by placing a piece of ½ or 1 inch board the width of the hive in length, and 4 inches in width, nailed to ⅝-inch strips 4 inches long, and laying these pieces of boards flat at the hive-entrance with the cleats down. The packing at the front of the hives rests on top of these, and the bees pass under in going out or in.

The width of entrance to the hive can be varied to suit the wishes of each bee-keeper. I am not fully decided as to just what is the best width, but for strong colonies I think 6 to 8 inches in width by ⅝-inch deep is about right. I have tried widths from 1½ inches to full width of my hives, which is 15 inches in the clear.

Such a house as here described, with good, careful packing, I think can only be surpassed by a good, dry cellar, in any Northern winter or cold climate, for safe wintering of bees.

During winter at least, the hives should tip forward so as to run off the moisture if any accumulates on the hive-bottom.

The hive-covers are left off during winter with my methods of wintering bees, either in the cellar or out-of-doors.

There are some advantages that may accrue from wintering a part of our bees in the cellar and a part outside. Should our house burn down during winter, and our bees be all stored in the house-cellar, we would meet with the loss of all our bees, when, if a part are packed outside, they would probably be spared, and a nice start could be made

the following season, if it should prove a fair one. With 40 colonies in the spring, and a good season, the number could be increased to 80 or 100 by fall, and some little surplus honey secured, with good management.

During mild winters the flights had by the outdoor bees are pleasing, and, if the stores are not very good, quite beneficial.

I have used, on a small scale, chaff hives for wintering, but on the whole I do not like them. These hives are unhandy to work with in summer, and the packing becomes damp, and, too, seems to furnish a place for ants and their nests. However, I have not tried the later patterns or styles. Carroll Co., Ill.

"Hundred-Dollar Queens"—Historical.

BY HENRY DIDWELL.

ONE April day, some years ago, I sent Rev. L. L. Langstroth \$25 for one Italian queen, and while I was waiting for her arrival I removed a German queen from one of my strongest colonies, and the drone-comb from all the others, replacing it with worker-comb.

The queen arrived by express about May 10, costing \$3.75 for charges. I introduced her into the queenless colony, and in the course of one month her worker-brood appeared in great numbers, and some ten days later drones appeared—about the time I first found eggs in the queen-cells. These queen-cells I removed, replacing them with cup-cells from the other hives, and gave the cells with eggs in, one to each of the strongest colonies, first removing the queen the day before and subsequently destroying all the other cells. I also removed the drone-combs as fast as the queen laid in them, and put them into the strongest colonies to mature, replacing them with drone-comb. With all my care I found some drones of the brown variety in a number of hives, but I have this to relate, that the young queens were more apt to mate with a similar drone to those in her hive.

From the Langstroth queen I reared 302 queens, and sold her in August for \$20.

The yellow bees did twice as well as the brown ones on account of their superiority, which was principally due to their greater prolificness, the yellow queens laying 4,000 to 5,000 eggs a day in the working season, while the brown queens laid about 2,000; and I had to double the capacity of the hives the yellow queens were in by giving them an additional story, which they occupied with brood. This enabled the yellow bees to reproduce themselves so that the young queens were as good as the mother queen, and this is the secret of getting and preserving \$100 queens.

A mile south of where I lived was a long lake, ¼ mile wide, beyond which the brown bees could not be found, but the yellow bees flew across and brought back some 2,000 pounds of thistle honey the first season I got them, and I was satisfied that they doubled my yield of honey. To avoid in-breeding, I offered Mr. Langstroth \$100 for another queen as good as the one he had sent me, but I subsequently learned that Nature had provided a remedy to offset the evil effects of in-breeding, by feeding the males and females different kinds of food to grow them apart, so they could be bred together.

My yellow bees were very uniform in color, but I noticed an occasional bee more clear and transparent than the others, and it occurred to me that if I could get queens from these eggs they would be more yellow, and after three years of careful selection I got rid of the brown on the end of the queen, but, unfortunately, in wintering my bees in trenches, in Minnesota, a gopher got in and filled the trench with dirt, and I lost what I had gained there. I have been trying the same experiment here, and have succeeded in producing, the past season, three queens purely mated, all yellow. Sedgwick Co., Kan.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the new bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 758.]

INFLUENCE OF CLIMATE ON HONEY.

Pres. Whitcomb then gave the following explanation: "In some remarks made at the Omaha convention relative to the influence of climate on honey, I was slightly misquoted, as these remarks were only intended to compare the effects of climate on the kinds of honey produced in our own climate, and not to contrast our own honey with that produced in Texas, Florida, and other Southern States. I said that taking white clover, for instance, we were not able to compete in richness, density, and flavor with Minnesota, Wisconsin, northern New York and Canada. In our own State we have found that the best premiums are taken by the more northern counties, while in heartsease honey they were not able to compete with our own locality. I have been a newspaper man for more than 20 years, and know what a controversy thru the press means, and have foreborne making this explanation until this time in order to do full justice to the bee-keepers of the South, whose product I am little acquainted with, and whom I recognize as producing fine honey of their class, and which we could not hope to produce, or even make a comparison with any other produced anywhere. I am not at all surprised that these remarks, going out as they did, should be resented, but trust that my explanation will be received in the kindly spirit in which it is made."

The convention then adjourned until 1:30 p.m.

THIRD DAY—AFTERNOON SESSION.

The afternoon session was called to order by Pres. Whitcomb, and after singing the "Convention Song" and "The Hum of the Bees in the Apple-Tree Bloom," the discussion of Mr. Danzenbaker's paper was resumed.

THE HIVE DISCUSSION CONTINUED.

Dr. Miller—It is a little easy for us to make general statements that are hardly warranted. Mr. Abbott is generous with his ridicule. We want the masses, and I am of the mass. Perhaps it is a matter of locality. I have tried producing section honey without separators. I would like to dispense with the expense, but it costs too much to dispense with them. Mr. Danzenbaker says it is not wise to use hanging frames when we lose half the bees with them. I think sometimes it is a great advantage to have the hanging frames if we could use them without loss; but I cannot afford the loss. I don't lose half my bees, tho'. These separate statements about this case and that case do no good.

Mr. Danzenbaker—How many did you lose last winter?

Dr. Miller—About half. I have two Danzenbaker hives, and the rest have open-end frames; part of them are Hoffman frames, and I wish they were in other frames. The two colonies in Danzenbaker hives were strong.

Mr. Hershiser—I have had a little experience with the Danzenbaker hive, perhaps more than some of you. I lost more bees last winter in double-walled hives than in the Danzenbaker single-walled hive. The objection I have is the bother of tinkering hives.

Mr. Coggshall—I have no closed-end frames. They are all hanging frames.

Mr. Stone—I would like to ask Mr. Danzenbaker a question. I have never used closed-end frames, but in turning the hives, won't they all run out?

Mr. Danzenbaker—Just reverse the sections and leave them there until the honey is ripe, then turn them back again. Bees get ahead of us sometimes.

Mr. Cook—To manipulate bees to the best advantage, use the reversible frames. I like the reversible frames for honey production. The best way to stimulate brood-rearing is by reversing. The honey will not run out. In shipping

it is the jarring that breaks the comb. It is put in before it is ripe.

Mr. Stone—I am sure my honey was ripe, as some frames were put upside down, and the honey didn't run out. It moistens, or something.

Mr. Cook—I understand that if the bees put it there it won't run out.

Mr. Danzenbaker—Not if you turn it just a little.

Mr. Halman—I would like to ask Mr. Cook a question. We all know that bees build right side up. When we reverse doesn't it stand the brood on its head, so to speak?

Mr. Cook—When bees build cells they build them at right angles, or nearly so.

Dr. Miller—When you reverse that will it trouble the queen about brood-rearing with that slant to it?

Answer—No.

Pres. Whitcomb—I believe Mr. Danzenbaker's hive is as good as anybody's hive. I have no choice. I believe when Father Langstroth invented his hive it was as nearly perfect as could be.

Mr. Poppleton—We want a different hive. I understand that this discussion is limited to comb honey.

Dr. Miller—Do you mean to say that a hive that is used for comb honey is not as good for extracted honey?

Mr. Poppleton—I do. Anything that is manufactured for a special purpose is better for that purpose than what is made for general purposes. I also think that we have different temperaments, and can do best with different implements. My experience is, that the long hive, single-story, is the best.

Dr. Miller—I believe that, perhaps, is the thought of a good many, and I don't believe that we can impress that too strongly on our manufacturers. They tell us, "You want a hive that will do for extracted honey, for some time you may want to use it for extracted honey," and in that way they have held my nose down to the grindstone. I am glad Mr. Poppleton is here.

Mr. Best—Isn't there something in the bees? I have supers for comb honey and supers for extracted honey, and I could see no difference. Both hives were filled with honey.

Dr. Miller—What kind of honey was it?

Mr. Best—White.

Mr. Stone—Put on two section supers.

Dr. Miller—I don't believe he extracts from the brood-nest. There is just as much distinction between these sections even tho' they are up and down.

Jas. McNeill—How large are Mr. Poppleton's frames?

Mr. Poppleton—My frames are 12 inches square, inside measure; hives are 36 inches long, 13 deep, and 13¼ wide, all inside measure. This is the standard size I use, but have in use others of different lengths, both shorter and longer.

Mr. McNeill—Are they separated by a brood-chamber?

Mr. Poppleton—No. When I use a single super I can keep far better control over a colony than when working with the double brood-chamber. If they are rearing young queens I know it.

Mr. Coggshall—While that might do down South, it would not do everywhere.

Mr. Poppleton—I used it in Iowa 20 years.

Mr. Coggshall—With the double brood-chamber there is plenty of room for them to go down. I can tell by the looks of the extracting-combs if the colonies are queenless. The drone-comb will be more polished than when the colony has a queen. If there are little cups, and these are polished out, they are queenless.

Dr. Miller—There is a great deal in Mr. Coggshall's argument, but we must not forget that we are not all over the world. Mr. Poppleton stands almost alone; he is almost a crank; but if he were in Germany he would be doing like everybody else. It is all right for Mr. Poppleton, but it would be a bad plan for us.

Mr. Niver—Mr. Poppleton has 100 colonies, and he wants each one to do its best. Mr. Coggshall has 1,300, and he wants to get the most speed.

Mr. Danzenbaker—In Florida a double brood-chamber hive would be best on its side.

Mr. Stone—I believe locality makes no difference. I use 10-frame hives, and I notice that they don't have honey enough to fill the outside frames. If I should keep on extracting, I don't believe they would ever fill the hive. I don't keep bees to see how much I can get from them. I do it for fun.

Mr. Danzenbaker—Did I understand the member to say that he doesn't put the sections on until the brood-chambers are full?

Mr. Stone—No, I don't put them on.

Mr. Danzenbaker That is where you make a mistake. If you put your sections on the very day the swarm goes in, the same hour if possible, you will get more honey. Fifteen years ago I bought some honey for 50 cents, and paid 40 cents for some other. I get 20 cents now.

A paper by Mr. P. H. Elwood, of New York, was read next, entitled,

Can and Ought Bee-Keepers to Control the Honey Market?

It would seem to be an easy matter for bee-keepers to control the price of honey when nearly all the honey produced is sold by commission men. Each producer can easily instruct his merchant as to the price he wishes his goods sold at, but unless there be co-operation in fixing the price he will not be much benefited by so doing. If he alone attempts to fix a price above the average, his goods will remain unsold. If, however, all producers unite on a fix or uniform price, the result will be entirely different. It is this uniting that is the difficult part.

In nearly all kinds of business co-operation has been successful except among the agricultural classes. It is difficult to see why an intelligent class of men cannot figure out the cost of producing a pound of honey, and add a reasonable profit thereto for a selling price. We all know that a large crop can be produced more cheaply per pound than a small one, therefore the first step is to ascertain the amount produced and its location in the country. Then a committee of producers and middlemen can fix a price below which it is not desirable to sell.

Establishing the price of honey is now largely the work of a few individuals, and too little attention is paid to the size of the crop. I happen to know that the efforts of one man (Mr. Segelken) last fall very materially raised the price of fancy comb honey, which was scarce. It was not proposed that this scarcity should affect the opening prices of honey. By so doing the wholesaler would reap the principal profit of this scarcity, instead of the one legitimately entitled to it—the producer.

It may be said that it will be difficult to establish a price for the many sizes and styles of packages offered. A minimum price would strike an average grade, and no objection would be raised to an advanced price for a particularly desirable or fashionable package, of which the supply may not be equal to the present demand. It is safe to say, however, that with a full supply of the various shapes and styles of the one-pound package of comb honey, there will not be much difference in price when attractively put up.

I do not see what objection can be raised to an arrangement of the kind proposed which is wholly advisory and not compulsory. Its fairness and merits would secure its general adoption. While carrying with it the idea of giving a living profit to the producer, it would also benefit the consumer by some supervision over the distribution of the crop, thus preventing a glut in some markets, as at present, while a scarcity exists in others.

We can learn something from the fruit-growers as to organization, but the task before us is simple, as our goods are not perishable. The present crop will market itself, but with a full crop thru the country co-operation between bee-keepers and middlemen will become imperatively necessary in order to maintain living prices.

P. H. ELWOOD.

Mr. Selser—I am sorry that the paper is so short, for I thought it would be one of the most interesting. The great trouble in marketing honey is shipping honey to the commission man. Mr. Wood was here yesterday. Mr. Segelken was also here. There is one gentleman here that sold him part of his crop at a fair price, and it never went to New York, but to Pittsburg. When there is any fine honey around Philadelphia I hear of it, and I try to keep myself in touch with the honey market so that I can quote prices. I went down to the market and saw honey that had been sold for 10 cents that was worth 15 cents. The fact was that the commission man knew no more about honey than a cat. I want to emphasize this to every bee-man, *not* to ship honey on commission. I think there is no other one thing that does so much to bring down prices. They would not pay *my* price. It hurts me, of course, and it hurts the producer more than it does me.

Mr. Root I think Mr. Selser's mistake is that there are two classes of commission merchants. We do buy honey, but sometimes after we have bought honey it goes down in price, and we have it on our hands. If we had it on commission we would not have lost so much. It depends upon who the commission men are, and upon who the buyer is.

Mr. Poppleton—Mr. Root is right, but I sell to commission men when I can get more than in any other way. I sell both ways, in every way.

Mr. Selser—Does not the responsibility of the man make a difference? But some men worth half a million are not fit to sell honey.

Mr. Abbott—I am glad Mr. Selser has said what he has, for I think that the whole commission system is a humbug. He might as well ask you to loan him the goods as to ask you to send him the goods on commission. You cannot do for others as well as you can do for yourself. My wife and I never both leave home at the same time. She staid at home this time. A gentleman came into our place the other day and askt my wife what we paid for honey. She said "11½ cents." He said that the man across the street told him we paid only 9 cents. My wife is not given to ridicule as I am, but in this case she said the man across the street *lied*. The man came to me. He had left honey with this man, Mr. Willman, but he had plenty of honey on hand, and began to kick about the price. I didn't know the man, but I told him my price, and he told Mr. Willman the honey was sold, and I was glad to handle it, for there were men waiting to buy at 14 cents a pound. In this case the commission man lost money. It was a little batch, so he didn't lose much, perhaps \$2.00. I haven't sold the honey yet, for I believe it is best to hold onto honey, for honey will be honey before bees fly again. But it is a mistake to send honey to this, that and the other man. I pay people for honey before I see it, and sell goods for cash. I always get the money, or they don't get the goods. I do business on a cash basis.

Mr. Selser—There is only one trouble with Mr. Abbott; he lives in the West, and we want him in Philadelphia. Cannot you come on here?

Mr. Abbott—I would spoil your business. [Laughter.]

Mr. Selser—There is no demand for honey now. If those persons who are pushing honey on the market would wait 30 days, honey would advance. There is not very much call for honey in September, but if you will wait until October or November you will get better prices.

Mr. York—We have honey commission men in Chicago—not as many as we used to have, however—and I agree with Mr. Abbott in one thing, and that is, that I get cash and pay cash. I don't always pay when I get the honey, for people know that I will pay for it just as soon as it is sold. But the price is agreed upon before the honey is shipt to me, so there is never any trouble. A commission man said the price of honey was 13 cents per pound. When askt if he had honey, he said "No." There was no honey on the market. What did he know about the price? One of the Chicago commission men is in Colorado buying all the honey he can get his hands on. I knew of one place where there were five carloads that they were holding for better prices.

Dr. Miller—Before you hang all the commission men I want to say one word for them. I believe I have a right to hire a man to sell honey for me if I don't want to sell it myself. That is all there is to the commission business. The honey is mine until it is sold; if the commission man does not pay me, I can jail him for it. There have been years when I couldn't sell one pound of honey, and those were the years when I considered the commission man my friend. If you sell it to a rascal who cheats you out of your price, it is no worse than to sell to a man who will not pay after he has the honey. I remember one year, when honey was very scarce, the commission men bought it up and had it on their hands. But who sets the price? The commission men. They put the price in the bee-papers. They set the price for us, and I think we ought to say to the commission men, "You are wronging us." I have said it in papers, and *you* ought to say it at every opportunity. Suppose you sent honey to a commission merchant who quotes 8 cents a pound. When he sends returns he sends 9 cents. You are pleased, but his quotation has helped to lower the market. The commission men put honey down for one reason and another. Once in awhile one will put it away up. Quotations are not as they ought to be.

Mr. Selser—The price of honey is fixt by one thing—supply and demand.

Dr. Miller—Not always.

Mr. Selser—I quote Philadelphia and New York, for I think they are the biggest markets in the United States.

Dr. Miller—I have seen Mr. Selser's quotations, and I have thought, "Is that man a rascal?" His prices are nearly always above others.

Mr. Selser—You can watch my quotations. If honey is

16 cents I quote 15 cents. The one cent is allowed for commission, but I do not handle honey on commission.

Dr. Miller—That is the point upon which we need instruction. If honey is quoted 13 and 14 cents, I understand that that quotation means that we will get 13 and 14 cents, less the commission, freight, etc.

Pres. Whitcomb—Freight and cartage must come out, leaving about 10 cents. If what Mr. Selser says is true, then we have been fooling ourselves out of one cent a pound. The bee-men in the country don't know what they will get for their honey. There has been a good deal said about commission men. I have many friends among them, but they do not handle honey. If you go to a dollar-and-a-half hotel you don't expect to find a four-dollar hotel. If we want the best class of honey we go to the producer. The commission man never will do justice to honey, for he often handles a poor article.

Mr. Danzenbaker—I have been a farmer, and when I had anything to sell I had no trouble in getting a good price. I sent a sample of beeswax to a dealer, and he offered me 27½ cents per pound. I kept back ten pounds of the wax because I thought it was not good enough. He sent me 28 cents—one-half cent more than I expected. I know a commission man who bought comb honey, and as he didn't want to bother with it, it was allowed to get dusty, and a man came along and paid 8 cents for it. I sometimes let commission men sell honey for me. If I have honey that is a little "off" I don't want people to know it is mine, so I take it to a commission man and I set the price.

Mr. Hershiser—I think Mr. Danzenbaker is right. When I leave honey with a commission man I set the price. This year I left honey with a commission man, and he was offered 5 cents for it. I said I would not sell honey for 5 cents, so he gave the man my address and I sold it to him for 7 cents. The bee-keeper knows what the net price would be; it is only necessary for him to set the price.

Mr. York—One reason why I do not believe in the commission business is the great temptation to be dishonest when doing business that way. It is too great for many commission men to resist.

Mr. Niver—I was down on the Elk Street market in Buffalo, and I saw some very nice clover honey there. I ask the man in charge the price. He said "12 cents." I told him honey was scarce this year, and this was worth 15 cents. He said *no*, honey was not worth more than 12 cents. His name is Townsend, and he quotes prices in *Gleanings in Bee-Culture*.

Mr. Hershiser—I was down there on the market after Mr. Niver was there, and he was selling it for 12½ cents.

Mr. Root—There is one thing that the bee-papers can do—they can refuse to quote commission prices. We don't want to be hasty, but it will perhaps be best to limit quotations to a cash basis.

Mr. Niver—Mr. Townsend told me that it was none of my business.

Mr. Hershiser—Commission men are apt to speak a little short, especially to honey-men. I don't think we ought to be too hard on them if they show a disposition to be honest. In Pittsburg the markets are a little higher than anywhere else, because the honey-flora is scarce around there.

Dr. Mason—Is a man honest when he sells honey that Mr. Niver says is worth 15 cents for 12 cents?

Mr. Hershiser—I think so. I don't believe in assailing a man's honesty.

Mr. Niver—I don't wish to assail Mr. Townsend's honesty, for I know the man, but I thought he was a little short. He had no right to say it was none of my business.

Mr. York—Batterson & Co. were lately quoting beeswax at 30 cents a pound. I wrote them, offering them some fine wax at 28 cents; they then offered 26 cents delivered in Buffalo! Of course, I didn't ship any to them. This over-quoting of the market ought to be stopped; also the taking of over 10 percent commission.

Mr. Poppleton—I don't like Mr. Selser's quotations. He should quote the selling price.

Mr. Danzenbaker—I could sell honey to one man for only 15 cents, but quotations fix it at 16 cents. Whenever I have found a commission man that didn't know prices, I bought the honey he had, and kept up the price.

Dr. Mason—If I were selling honey thru commission men I'd like Mr. Selser's way. Then we know just what we will get.

Mr. Selser—In regard to these quotations, Mr. Poppleton has hinted at a very good point, and that is, that it costs a great deal more to send honey from Florida than from New York. Who fixes the price of honey? When I quote honey I don't go to commission men to find out prices. I

am governed by supply and demand. When I went to college my professor taught me that a thing was worth only what it would bring. If I start out and fix a price for comb honey, and I see that there is a great deal of comb honey in the market, and it will not bring what I have quoted it at, I offer it for a lower price.

Mr. Hutchinson—It seems to me that the simplest way is for the commission men to quote the price of honey. We know what freight will cost. How does he know just what it will bring?

Mr. Danzenbaker—When I see his quotation I know what he will pay.

Mr. Selser—Mr. Danzenbaker is correct, and yet he is not. I don't go to the commission man to buy honey. I get it from the producers.

Dr. Miller—I am inclined to believe that Mr. Selser is incorrect about what other firms' quotations mean. Some would make this mistake: There is no commission to come out of his, while with others there would be commission. There ought to be some way that we could be *sure*. I ought to know before I write what the commission is. Here are two points equally distant from me, and I ought to know if there is a difference in commission. I believe there often is.

Mr. Wander—Why would it not be a good idea to have a committee, and let that committee be the editors of honey quotations in the bee-papers; and knowing all about it they can influence prices.

Pres. Whitcomb—The scheme is to quote large prices.

Mr. Root—I think we as editors might do a great deal. A while ago I wrote an article about this, and if you noticed the price advanced in a very short time. In regard to commission, there was one time when commission men charged 10 percent.

Mr. Abbott—Did you ever have this trouble, where commission men quote prices when they have no honey?

Mr. York—A commission man in Chicago said that no man can do business there on a 5-percent commission.

Mr. Hutchinson—Do you suppose the 5-percent men would allow their names to be used?

Mr. York—I think not. Ten percent is about right.

F. G. Herman—Mr. York, can't they make a limit in the price of honey on commission?

Mr. York—Yes.

Mr. Root—We ought to know if honey is scarce.

Mr. Hershiser—It is about one-third of a crop this year.

At this point Mr. York proposed the following amendment to the constitution of the Association, and after thoro discussion it was recommended for adoption:

Whenever a local bee-keepers' association shall decide to unite with this association as a body, it will be received upon payment by the local secretary of 50 cents per member per annum, providing that the local association's membership dues are at least \$1.00.

Mr. Howe thought the local secretaries had enough to do without added work.

There was a rambling discussion as to the benefits of membership in this Association at this point that the reporter failed to get, but it was proven to the satisfaction of all present that membership in the Association is a practical benefit.

Dr. Miller—Membership is a practical benefit.

Mr. York—A year ago the Red Cross Society were doing relief work in Cuba. They wanted a dollar a piece from individuals to carry on their work. I paid my dollar. It didn't help *me*, but I was not sorry I paid the dollar, for it helped others. If membership in this Association helps to prevent adulteration, won't it pay? This world is awfully selfish. The average person, I am sorry to say, seems to want to get 75 cents worth for an investment of 25 cents.

[Continued next week.]

York's Honey Almanac is a neat little 32-page pamphlet especially gotten up with a view to create a demand for honey among should-be consumers. Aside from the Almanac pages, the forepart of the pamphlet was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample for a stamp; 25 copies for 40 cents; 50 for 70 cents; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

The Premiums offered on page 782 are well worth working for. Look at them.

THE AFTERTHOUGHT

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

THAT CITY-APIARY PICTURE.

And now we have a city apiary in which we can actually see some houses— which doesn't try to look like "a lodge in some vast wilderness" (lodge itself left out). Pleasant to see the skill with which Mr. Horstmann makes the best of his apiary. Capital idea is that of his to have something more esthetic than stones on his hives. Shade-boards must be weighted, and a big flower-pot has the requisite weight, sure enough. But in case very precious plants were so exposed, and in case a regular "jimmycane" should come along, might there not be a sad wreck, and lamentations from one side of the house? An army-pan full of dirt makes a good weight, and will not break—but I was disgusted to find I could not plant phloxes and things in them and have them thrive—too much oxide of iron soon permeates the soil. Page 673.

SULPHURING COMB HONEY FOR WAX-WORMS.

Mr. Doolittle is so eminent and excellent in almost all that pertains to apiculture that it is almost pleasant to be able to throw a stone at him once in awhile. His method of killing worms in section-honey, page 674—well, he makes it work, and others probably can if they're canny. But he surely could, if he tried, get up a less idiotic way of burning the sulphur. When a big lot of sulphur is dumped on some coals several things happen. A large fraction of the sulphur melts, runs down among the ashes, and thenceforth does neither good nor harm. Another large portion, instead of burning, changes to pure vapor of sulphur, rises, encounters cool air, and changes back to the solid form again as extremely minute particles of sulphur mixt in the air like smoke. This is capable of doing harm, and not capable of doing much good, I take it. Another portion of the sulphur is *imperfectly* burned, and becomes vapor of sulphurous acid. This is what we want; and if we only knew some way to get this and nothing else we'd be happy. Not quite positive, but I do not think this alone would damage the looks of comb honey, even if it was somewhat in excess.

Lastly, another portion of the sulphur is *perfectly* burned, and becomes vapor of sulphuric acid. Wish I was better posted as to the effect of sulphuric-acid vapor. My impression is that it does both good and harm pretty freely—that is, quite destructive to animal life, and also quite damaging to the appearance of surfaces with which it comes in contact. Hot fire and abundant supply of air are understood to favor the formation of this latter kind of vapor. Who'll help us out of the wilderness? If any of you has a honey-room 10x10 feet, and eight feet high, Mr. D's. formula would call for *eight pounds* of sulphur evidently enormously more than there is any sense in using. Say, try *one* pound of sulphur mixt with seven pounds of ashes, and burn it over a bellows draft.

DOES RHEUMATISM "ROOM" WITH HONEY-EATING PEOPLE?

"Rheumatism practically unknown among those who eat much honey," eh? I am not sure that I like such a flippant way of saying things which would be immensely important *if true*. I am heartily in favor of *finding out* about several such things; but proclaiming them in an unqualified way just now may impress the general public with the idea that we don't care very much what we say. Page 674.

THE SWEET-TOOTH MICE.

I think Mr. Dadant in error, page 675, where he says mice are very fond of honey—only try to eat it when very near starvation, would be the way I should say it. They are fond of *bees* and also gnaw combs because fond of gnawing things up on general principles. But then, besides the world's universal mouse, there are several American species more or less prevalent. Some of these latter may have a sweet tooth, for aught I know.

NOT "ROOTLESS" GUESSES ON APIARIAN STATISTICS.

Ernest Root gets to business well in his estimate of what we would be glad to know, the United States honey

statistics. Good thing to have one anchor to hold on to, in room of drifting on an endless sea of guesses. The fact that something over 50,000,000 sections per year are used on the average is the anchor—and the pseudo-statistics of the States and the nation are the "false lights on the shore." Coming down to guesses, his guess that 500,000 people own bees (one or more colonies), and that 200,000 people take some practical interest in their bees—this is a fair and luminous guess, and will do to lean on a little till we have something better.

TEMPTINGLY BEAUTIFUL GIRLS.

Now see the winter of our bachelors' discontent
Made worse by the plan of York.

Editorial note, page 680. He's just going to make the girls more beautiful and tempting than they are now by washing their faces with honey. Stop him, somebody? [If Mr. Hasty will just be slow about letting the girls in his neighborhood see that item on page 680, he'll not need to call for anybody to stop us. But perhaps Mr. H. is waiting for the perfectly beautiful girl. If so, he might furnish the honey to some nice girl neighbor, and try it on.—EDITOR.]

GETTING CRISSCROSS NEIGHBORS TO KEEP BEES.

Get your cross-grained neighbor to keep a few bees himself, and he'll cease to rage and pitch so against your bees. Page 680. Guess that's so—but it strikes one at first like the mouse-plan of putting a bell on the cat—rather difficult of execution. Still, perhaps with sufficient craft and patience it might be done. Inoculate him now and again with small doses of the wonders of bee-lore. By-and-by when a late after-swarm of very small value alights on his tree, tell him you'll give them to him, and also give them in a box or keg for him. If he takes this bait of yours, converse with him frequently about *his bees*. Got him sure, if he shows signs of wanting them fed up to winter over, instead of "taking them up" and realizing on their slender stock of honey. Even if he decides to take them up, you'll get him next year.

RAMBLER'S DIME SCALES.

Those scales of Rambler's, in which a common 10-cent spring balance is made to weigh the daily gains of a hive, is well worth remembering. (Balance the hive with pole and stones, and then attach the spring balance so as to take the *additional* weight of the day's gathering.) Page 683.

A GOOD BUSINESS NAME.

What a *friendly* face is that of William A. Selser, that opens in No. 44! And how suggestive the name is—"Sell, sir!" It's one-third of the business to produce honey, and two-thirds to sell it. This pleasant friend not only sells his own honey, but also that of a great many brethren who are a little lame on the mercantile two-thirds. Did you ever reflect what an amazing lot of people have names germane, somehow or other, to their business? Partly runs in the blood (names originally bestowed on account of business) and partly just the reverse (the suggestions of the name turning the bearer's thoughts in that direction) and partly, of course, by chance. This county has an undertaker named Coffin, and another and prominent one named Couldwell. The leading dynamite dealer (Toledo) is named Rummel. The Cincinnati mercantile firm of Ketchum & Cheatnam is oft bespoken as an example; and a multitude of illustrations meet us at every turn.

BEE-KEEPERS' EXCHANGES.

As to commenting on the paper "Why Bee-Keepers' Exchanges Fail," perhaps I might as well wait until I can comment on "Why Bee-Keepers' Exchanges Succeed." However, it seems that in some places they do succeed to a certain extent—very like the boy succeeded in catching the woodchuck, because they *must*; no one man being able to get just his own honey alone disposed of at the distant market without having charges eat it all up. Page 691.

THOSE BRAGGING HONEY-YIELD TABULATIONS.

The tabulation of the honey-brag, by Mr. Adrian Getaz, is a very unusual and remarkable paper. Better mark it and keep it where it can be got at for reference. But how are we going to manage it, anyhow, to believe that Dr. Gallup got 750 pounds, and Mr. Snyder 700, and Mr. Maley 718, and Mr. Doolittle 506—and still harbor a private notion that those Australians fib about their larger figures, running up to 1,250? Page 693.

"LIGHTNING HARRY" IN CUBA—HOW(E)'S THAT?

And so our lightning Harry Harry Howe—has got to Cuba and is running three apiaries there. And they have

"location" there allee same as here. His three apiaries do not run alike, tho on a line only 11 miles long. Page 694.

HONEY FROM WILD ROSES.

And the "upper ten" in Constantinople are pampered, it seems, with a honey gathered in a region of wild roses, and very conspicuously flavored therewith. Would like to be a "Constant 10" long enough to get one taste of that honey. Page 699.

FLOWERS WAITING FOR INSECT VISITS.

How curious are Nature's ways—in that flowers, effectively covered from insect visits, remain in bloom several days the longer for it, *waiting for them*. Hard to be an anti-bee skeptic in the face of such evidence as that; Page 700.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

A Beginner's Questions.

1. How can I start with queen-bees? Will I have to have other bees to feed them? I saw queens advertised in my paper at \$2.00 each. I am thinking of getting some.
2. Could I rear bees in the same neighborhood with other bee-keepers?
3. What is a nucleus? SUBSCRIBER.

ANSWERS.—1. A queen can start alone without any other bees, construct a nest and build up a colony, if she is a bumble-bee queen, but not if she is of the hive-bee sort. A queen of the latter kind is utterly worthless without a force of workers. So far as feeding is concerned, she might feed herself, altho that wouldn't do so well; but she wouldn't know a thing about building combs, she couldn't tend baby or clean house, and she would be chilled to death in a temperature that would be just comfortable with a family of workers around her. If you will watch the advertising pages of this journal, you will find queens advertised for less than \$2.00 in the spring, unless you want something special for a breeder.

2. Yes, you can rear bees in the same neighborhood in which other bees are kept, unless others already have all the bees the territory will bear, in which case it would be bad for them and you to add any more, and you ought to find some locality where there is less danger of overstocking.

3. There's about the same difference between a nucleus and a full colony as there is between a little boy and a full-grown man. With only bees enough for one or two combs, it's a nucleus. By all means get a good text-book on bee-keeping.

Proper Spacing of Brood-Frames.

If you were going to use the Quinby frame spaced with nails the same as you do your Langstroth frames, and winter the bees on the summer stands, which would you use, $1\frac{1}{8}$ or $1\frac{1}{2}$ inch spacing? I mean, of course, from center to center. Do you consider the $1\frac{1}{2}$ -inch spacing any better than the $1\frac{1}{8}$ for wintering out-of-doors? PENN.

ANSWER.—I would use the same distance from center to center, no matter what the means of spacing. But if you insist upon knowing whether $1\frac{1}{8}$ or $1\frac{1}{2}$ from center to center is best, I must confess I don't know. Nearly all hives made nowadays are made with measurements favoring the $1\frac{1}{8}$ spacing. Yet some whose opinions are entitled to respect refuse to follow the crowd, and stick to the $1\frac{1}{2}$ spacing. In favor of the $1\frac{1}{2}$ it is said that that is the measure-

ment bees use when left to themselves. Others say they use $1\frac{1}{8}$. In the cases I have examined, the bees seemed to have been impartial, sometimes using a spacing nearer one measurement, and sometimes nearer the other. But my observation has been somewhat limited. Counting brood-comb $7\frac{1}{2}$ -inch thick, the actual distance between two combs with $1\frac{1}{2}$ inch spacing would be about 25 percent more than with $1\frac{1}{8}$ spacing, and if the bees are packed just as densely in one case as in the other, a colony with bees enough to cover 7 combs with $1\frac{1}{2}$ spacing could cover 9 with $1\frac{1}{8}$ spacing. Very likely there is an advantage in that—at least at times. But it is just possible that in early spring it might be a disadvantage to have so few bees between two adjacent combs, for too few could not generate sufficient heat. On the whole, it is possible that one spacing may be about as good as the other.

Honey at the Cape of Good Hope.

Can you give me any statistics concerning the export or importation of honey at the Cape of Good Hope? If not, can you tell me where such information can be secured?

ROB ROY.

ANSWER.—I'm sorry to say I can neither give the information nor say where it can be secured. Possibly this may meet the eye of some one who can tell.

A "Guess" Wanted.

The question I am about to ask is one to which, it seems to me, you can very reasonably reply by saying, "I don't know." Nevertheless, I am going to ask you for your "guess," because I believe your guess will be worth more than mine.

Along towards the last of July I began feeding a strong colony of bees with a view to making it swarm, as I wanted a few queen-cells. On Aug. 6 I examined and found no cells started, so I took out the frame on which was the old queen, and continued the feeding. The colony swarmed Aug. 21, and, of course, the swarm had a virgin queen. It occurred to me along in September to examine the hive of the swarm, but I could find no evidences of the presence of a queen. I made a few more examinations during September, with the same result, and concluded that I should have to buy a queen for the swarm. Before doing this, I made another examination and found a queen on one of the combs, but there were no signs of brood to be seen. The last examination, I think, was in the early days of October.

It seems to me that the queen should have been fertilized before the end of August, and that she should have been laying early in September. There was no lack of drones, and the honey-flow was quite good all thru the last-named month. I am puzzled to know whether I have a fertile queen in the hive or not; and, if not, why not? IOWA.

ANSWER.—I "guess" that the queen is no good and never will be any better. I don't know why. Barely possible it is a physical deformity that is not discernible to the naked eye. On the other hand, it is possible that the queen is all right, especially if no honey was coming in after the time she ought to have been laying, say Sept. 1. Some queens stop laying early—much earlier than others—and the same thing that would make a young queen stop laying Sept. 1 might keep a young queen from beginning to lay.

By way of keeping up your hope till next spring, here are three cases given in a French bee-journal, L'Apiculteur:

1. July 26, 1897, I took the queen from nucleus No. 1. Altho I kept watch from Aug. 25, I found no laying till Sept. 13, when I found one egg. This single egg was destroyed, and the laying ceased. Jan. 20 I took away the queen, and the comb on which I found her had worker-brood in all stages.

2. July 29, 1897, I took the queen from nucleus No. 3. Kept watch from Aug. 28, but never saw any laying. Feb. 26, 1898, I visited this nucleus, and the first frame I took out had worker-brood of all ages.

3. July 27, 1897, I took the queen from nucleus No. 4. I found no eggs till Sept. 13, when I found about 60. Sept. 22 eggs were still present, more than one in some cells, but they never hatched, and were destroyed by the bees. Feb. 26, 1898, I took away the queen, and one comb had brood in all stages.

[Entered at the Post-Office at Chicago as Second-Class Mail Matter.]

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. DECEMBER 7, 1899. NO. 49.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

Improved Spelling seems to suit Dr. Mason. In his department, "Good Things from Other Journals," in the Bee-Keepers' Review, he says he is pleased to see the steady but sure advance it is making, and glad to note that some of the bee-papers are not behind. The "t" for "ed" in the American Bee Journal lookt odd to him for a time, but now he thoroly enjoys it, and hints that he is expecting the Review to help on the needed reform.

Inky Drops from the Smoker, their cause and cure, have been for years troublesome problems for many bee-keepers, and it is not to be regretted that Dr. Miller's attempt to give a cure in this journal was not a brilliant success, for it has had the effect of bringing the attention of a number to the question, and now we have satisfactory light as to these dark spots. F. L. Thompson says a freshly cleaned smoker drops worse; Critic Taylor says dry fuel is the remedy.

Now comes R. B. Chipman, in the Bee-Keepers' Review, and says: "The moisture produced by damp fuel is a trivial matter compared with the amount of steam produced by combustion." While all will admit that the steam from combustion is considerable, they will hardly admit that it is of more consequence than the item of which Mr. Taylor speaks—the moisture that may be expelled by drying. Even supposing that the excess of moisture in damp fuel may not be as great as the steam of combustion, the fact remains that *it is excess*, and that it may be removed, while the steam of combustion is a constant quantity, alike present in damp or dry fuel. It is the excess that (like the last

straw that breaks the camel's back), comes in to do most of the inky-drop business.

But Mr. Chipman agrees with what Dr. Miller said in this journal for Oct. 26, that the dropping is caused by the moisture condensing on the *cold* nozzle, and says, keep the smoker *hot*; while Editor Hutchinson agrees with Dr. Miller, that one part of the remedy is to keep a coating of soot on the nozzle so as to make it a non-conductor. Putting together all that has been said, if you don't want dirty drops on your nice, white sections, the way to prevent it is to have fuel that is thoroly dry, don't clean out the nozzle, but keep the lower part clean, especially the holes in the fire-pan, so as to keep up a brisk heat.

Barrels vs. Tin Cans for extracted honey seems to be one of the questions upon which there is undue positiveness on both sides. Editor Hutchinson had a long interview with the elder France at his home, and Mr. France felt indignant at the bitter objection to barrels. Having the barrels thoroly dried in advance, they have no trouble with leaking. Pointing to the door of the honey-house, Mr. France said:

"Don't you see that the floor is just the right height, so that when a wagon is backed up there the floor and the bottom of the wagon are on a level? All you have to do is simply to *roll* the barrel into the wagon. Tin cans you can't roll nor shove: you have got to pick them up and *carry* them. When you get to the railroad station, all you have to do is to back the wagon up to the platform and roll out the barrel."

Most of the extracted honey in Wisconsin is put up in barrels. Some bakers and other large manufacturers prefer not to pay for more expensive packages. Mr. Hutchinson says:

"There is no doubt whatever that the men who buy honey from every class of producers, and then re-sell it to a varied class of customers, such men as Mr. George W. York, or the Roots of Medina, find the tin can a more desirable package. They have had a lot of experience, and ought to know what suits *them*, but they must not forget that there are others."

Moral:—Use the kind of package preferred by those to whom you ship, but don't use barrels unless you know that *you* can use them without leaking.

Shipping Comb Honey to Market.—A short time ago a large honey-dealer on South Water street (this city) askt us to call and see a small shipment of comb honey that had been sent in by a bee-keeper in this State.

Before shipping the honey the producer wrote the dealer that it was all white clover and basswood honey, supposedly of best grade of white comb honey, and the price agreed upon was 13 cents a pound at the railroad station of the shipper.

The honey came in, and to say that the honey-dealer was surprised, when he saw it, is to say it very calmly. It was all colors, all kinds of filling of sections, besides being "spotted, ring-streak and speckled"—some of it sort of kaleidoscopic when held up to the light. Some of it could hardly pass as a good grade of amber honey.

The dealer wrote the producer, telling him that the honey was not as represented, that he would hold it subject to his order, or allow him 10 cents a pound for it—fully as much as we should think it worth—in fact, *we* wouldn't want to buy it at that price. Of course, the shipper thought that it was merely another case of the dealer trying to swindle him out of his honey, when the honey was not at all what it was expected to be.

We cannot understand why any bee-keeper should attempt to "work off" honey on a large dealer that knows many times as much about what various grades of honey

should be as does the producer, and also knows the market value of honey in his city.

We should say, never ship any but the finest grades of honey to a city market. Sell the inferior kinds at home, or give them away, but don't expect to get the price of the best for the poor grades. Or, first send a true sample of the honey you wish to sell.

When we examined the lot of honey referred to above, we really felt sorry for the dealer who had agreed to buy it. Some bee-keepers have much to learn yet about honey. What *they* think is the finest often turns out to be a very common or poor grade when compared with other shipments of honey. But the only way to learn some things is to get it by experience, even if it does seem to come high in that way.

Color of Honey.—Wm. Muth-Rasmussen complains in *Gleanings in Bee-Culture* that many bee-keepers do not classify their honey as to the color of the honey itself. A section of honey is judged merely by the outside appearance. In a room in which the light enters by only one window, hold the section up between the window and the eye, and thus looking *thru* the section you can classify it as to color. If the light enters at any other but the one place, the color of the honey can be seen only indistinctly. Mr. Muth-Rasmussen suggests having samples of various shades in small vials, these to be used as standards by which to classify honey. The editor thinks the candying would interfere with the usefulness of such samples, and hints that colored cards might be used instead, such cards not costing more than a cent apiece. It is earnestly to be hoped that Editor Root will not let the matter rest till such cards are produced. Even if they should not fully answer their purpose, it would be much to have *something* as a standard of color. At present, one man calls white what another calls amber, and perhaps the majority have no clearly defined idea as to different shades. By all means, Mr. Root, give us the color-cards.

To Our Foreign Subscribers. This paragraph is for those of our subscribers outside of the United States, Canada and Mexico. It ought not to be necessary to announce it, but it seems that we must again repeat that any offers we make anywhere, do not apply to bee-keepers located in any country outside of the three above named. This should be self-evident on account of the extra postage to foreign countries. Whenever we receive *any* money from foreign countries (except Canada and Mexico) we just apply it *all* on subscription, and will stop sending the *Bee Journal* to such when the time paid for expires.

We trust this notice will be read by those foreign subscribers who have sent us money on our offers of queens, books, etc., in connection with the *Bee Journal*. We simply mail the *Bee Journal* to such for the amount they send, and make no other response.

MR. CHAS. C. MILLER, son of Dr. C. C. Miller, has recently been promoted to be clerk of the Inspector General at Havana, Cuba. He was in the Government War office at Washington previous to the appointment to his new position in Cuba. We wish "Charlie" every success wherever he may be.

MR. WM. A. PRYAL, of San Francisco Co., Calif., wrote us as follows, Nov. 22, about a great rain California has just been blest with:

"We have just past thru a great rainstorm. While we were not in need of it, it has been of untold benefit, as it assures us of a sufficient rainfall for the remainder of the season. There is not the least doubt but we shall have plenty of rain at intervals during the winter and spring to

give us a great crop of grain, fruits, etc., next year. Of course the honey crop is not guaranteed altogether by the copiousness of the rainfall; the atmospheric condition of the weather at the time the flowers are in bloom has much to do with the flow of nectar. Then, if there should be foggy weather at such time, the amount of honey gathered will be materially affected thereby. But, as I have intimated, we are in a fair way to count on a big crop of honey throught the State the coming year."

MR. E. R. HARRIS, of Ontario, Canada, writing us Nov. 20, had this to say:

"In renewing my subscription to your estimable *American Bee Journal*, let me say that I have found great pleasure as well as profit in the perusal of its pages, and so long as I keep bees, and the *Bee Journal* maintains its present high standard of excellence, so long will I be a subscriber."

Thank you, Mr. Harris. We hope you will always keep bees.

EDITOR W. M. BARNUM, of *Barnum's Midland Farmer*, has this paragraph in a recent issue of his paper:

"The probability of the early adoption of the new phonetic method of spelling by the University of Chicago will, we are sure, meet with the hearty approval of Editor York, of the *American Bee Journal*. It is a move in the right direction, and we shall take it up ourselves at some future time."

We would like to suggest to Mr. Barnum that if the spelling reform "is a move in the right direction," he'd better not wait until "some future time" to get a "move on him" like that. "Now is the accepted time," etc.

THE MICHIGAN STATE CONVENTION.—We have received the following from Hon. Geo. E. Hilton, about the next meeting of the Michigan State Bee-Keepers' Association:

FRIEND YORK:—I have just returned from Thompsonville, Michigan, the place of holding the next State bee-keepers' convention, which occurs Jan. 1 and 2, 1900. This will give us the advantage of the holiday rates on all railroads, and I have secured a rate of 75 cents per day at all three of the hotels. We have the Maccabees hall free of charge. This bids fair to be the largest convention held in the State in many years. Either Mr. J. T. Calvert or Mr. Ernest R. Root will be there, and other noted bee-keepers.

Geo. E. Hilton, *Pres.*

We would like to urge every bee-keeper who can possibly attend this convention to be present. Michigan bee-keepers always have a good convention, whether the attendance be large or small. But the next meeting ought to be a big one.

NICOTINE POISON. Dr. Peiro, the experienced Chicago physician, writes us as follows:

"I am interested in Mr. A. I. Root's illustration regarding his friend's tobacco habit, as given on page 733. Mr. Herkner's experience is simply that of thousands of others who, thru ignorance or willfulness (generally the latter), persist in the use of one of our most virulent narcotic poisons.

"For twenty years, and more, I have urged upon patients the absolute necessity of permanently quitting the use of tobacco in any form, to maintain or recover their health. Most have an excuse, however, ready and potent to annihilate all arguments. The way some roll their eyes in abject consternation, and vow their utter inability to forego making smoke-stacks of themselves, with pipes or cigars, makes me blush for the sex I represent.

"Such utter despair at the very thought of really having to stop the use of the loud-smelling weed is indeed pitiful, as indicating the complete lack of manly determination. Young lads, barely entered apprentices in the noxious experiment, affect the most doleful sorrow at the suggested abstinence. They bewail the fate that requires so soul-torturing sacrifice! Indeed, life could be but an intolerable burden without tobacco. 'O no-o! I couldn't live without it; I'd die, doncherknow!'

"I wonder what the progeny of such weaklings will be? Or will Nature come to the rescue to prevent moral degeneracy? If not, the common clam will far eclipse them in intelligence."

Do you want a Good Market for your Crop of Honey, BOTH COMB AND EXTRACTED?

We are in position to handle any quantity, large or small, to better advantage than any other house, for the following reasons:

- We deal almost exclusively in honey, giving it our closest attention all the year round.
- We keep ourselves thoroly posted as to the result of the crops gathered in the honey-producing States.
- We are acquainted with the most desirable trade throout the country, and know exactly what they wants are.
- We know, thru our long experience, the different varieties and qualities of honey; therefore know what we are selling, and no fear of selling fancy stock at the price of a third grade.
- We handle by far the bulk of all the honey sent to New York, and our volume of business enables us to make the charges very reasonable.
- Why, then, should we not be able to handle your crop to advantage, and do you justice in every respect?
- We handle not only on commission, but **WE BUY OUTRIGHT** as well, from small lots to carloads, for spot cash.
- If you prefer to sell your product, write us, stating quantity you have, quality, and how put up, and we will make you our cash offer.
- We shall be glad to correspond with you in regard to your crop, and hope to have the pleasure of hearing from you soon.

HILDRETH & SEGELKEN,

120 and 122 West Broadway, NEW YORK CITY.

Glass Honey-Jars!

We have two sizes of clear flint-glass jars, No. 1 holding a scant pound of honey, with an opal or white top held on with a screw metal band under which is a rubber to prevent leakage. No. 2 is a rather tall flint-glass jar with tin screw-cap, holding 1/2 pound of honey. Both are excellent for retail honey-packages, and are put up in single gross lots. The prices are per gross, f.o.b. Chicago, for the No. 1 jars, \$5.25; for the No. 2, \$4.25.

We can fill orders promptly for these jars. They give excellent satisfaction, we know, for we have used the same jars for several years.

Supers for Winter.—"Australian Yankee" has for years, for wintering, tried, side by side with chaff hives and hives with cushions on, hives with supers left on, and the latter colonies come best thru the winter.—Australian Bee Bulletin.

The Importance of Young Queens is urged by Editor Simmins. He says Mr. Cowan was among the first to insist upon their necessity, his practice being to keep them two whole seasons. But Mr. Simmins has never seen the queen that under high pressure would do as good work the second as the first season. They both agree that home-reared queens are best. As Mr. Simmins is a queen-breeder, that probably means queens reared in England as against imported queens.—Bee-Chat.

Worms and Pollen in Sections.

—In my experience wax-moth will never touch comb unless pollen has been deposited in the cells at some time, and surely no bee-keeper would ever put on the market a section in which the queen has laid or pollen has been stored!—Australian Bee-Keeper. That may be all right in Australia, but on this side of the globe lots and lots of worms have been found in sections where no particle of pollen ever had been. Neither would a single cell of pollen disqualify a section for market if the section were all right in other respects.

Long Boiling of Foul-Broody Honey Not Necessary.—Harry S. Howe thinks there must have been some mistake made by scientists in demanding

SWEET CLOVER And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

| | 5lb | 10lb | 25lb | 50lb |
|----------------------|-----|--------|--------|--------|
| Sweet Clover (white) | 60c | \$1.00 | \$2.25 | \$4.00 |
| Alsike Clover | 70c | 1.25 | 3.00 | 5.75 |
| White Clover | 80c | 1.40 | 3.00 | 5.00 |

Bee-Keeping in Colorado.

It is generally conceded that Colorado is one of the leading honey-producing States, and the opinions of its bee-keepers should have weight alike with bee-editors and supply-dealers. Realizing this, Editor E. R. Root is now attending the annual Colorado Bee-Keepers' Convention, at Denver, to become better acquainted with the Western bee-keepers and their methods. The readers of Gleanings in Bee-Culture will get the benefit of this in forthcoming issues. He has with him, of course, his camera, so as to present to our subscribers views of the West as he saw them. The first installment of these writings may be expected in our Dec. 15th issue.

Other Leading Bee-Keepers.

Gleanings in Bee-Culture Oct. 15th contained a biographical sketch of the most extensive bee-keeper in the world, Capt. J. E. Hetherington. This is followed in Dec. 1st issue by biographical sketches, with portraits, of the Coggs-halls, David and W. L. In this article will be a discussion of the 4-frame non-reversible extractor, with which Mr. W. L. Coggs-hall and his "lightning operators" have made such phenomenal records. Special features of Dec. 15th issue will be given in this column next week.

Our rates for Gleanings in Bee-Culture are:

- 3 months' trial—new subscriber... \$.15
- " " " " " " " " " " " " " " " " " " .25
- 1 year—old or new subscriber... 1.00
- 1 " " with ABC of Bee-Culture... 1.75

Clubbing Rates.

As an inducement for our subscribers to renew before the expiration of their present subscription, which saves us considerable time, we offer the following rates for Gleanings one year and a year's subscription to any of the following papers at prices mentioned.

For One Dollar Only.

Gleanings and your choice of the following:

- American Agriculturist, with Almanac.
- Orange Judd Farmer, with Almanac.
- N. E. Home-stead, with Almanac.
- Northwestern Agriculturist.
- American Poultry Journal.
- Reliable Poultry Journal.
- Agricultural Epitomist.
- Farm and Fireside.
- Poultry Monthly.
- Farm Journal.
- Poultry Keeper.
- Farm Poultry.

For One Dollar and Ten Cents.

Gleanings and your choice of the following:

- Practical Farmer.
- Prairie Farmer.
- Michigan Farmer.
- Ohio Farmer.
- For \$1.25 Gleanings and Rural New Yorker.
- For \$1.30 Gleanings and National Stockman.
- For \$1.50 Gleanings and Cosmopolitan or McClure's Magazine or American Gardener.
- For \$2.00 Gleanings and Country Gentleman.
- For \$2.50 Gleanings and Review of Reviews.

New subscribers also are entitled to these rates.

THE A. I. ROOT CO.,
MEDINA, OHIO.

so long boiling. He made experiments under the eye of Dr. Moore, of Cornell University, one of the World's best authorities upon the colon group, and found that between 10 and 15 minutes of actual boiling killed the spores as well as the vegetation stage of *Bacillus albi*, and a temperature of 150° F. for several hours would kill them. Sunlight is almost surely fatal to all bacteria that do not normally live in it.—Bee-Keepers' Review.

How Does the Queen Get Water? seeing she never leaves the hive when mating or swarming, is askt in the Australian Bee-Bulletin. The answers are not of the most direct kind, but say, "Bees supply the queen's needs," or something to that effect, the one who most nearly meets the question squarely, saying, "The workers supply her with food and drink." If this Boiler might be allowed a guess at the answer, he would say that the queen is a total abstainer, never drinking even water, there being always enough water in the food given by the bees to avoid the necessity of taking water clear.

Heading Off Swarming.—O. J. Hetherington gives his plan in the Bee-Keepers' Review. When the swarming season arrives, he drives the bees from the hive, and hives them in a new hive on the old stand, putting on supers. The old hive is put on a new stand and given a queen-cell, or, preferably, a laying queen. Five such driven swarms last season gave him 60 pounds of honey each, while the old colonies gave 90, 60, and less. When the harvest is over, he puts a queen-excluder over the old hive, sets the driven swarm over it, leaves it two or three days, then smokes down most of the bees into the lower hive, and kills the upper queen. The plan saves watching for swarms, secures a good yield, and leaves the colonies with young queens.

Large vs. Small Colonies.—Critic Taylor comments in the Bee-Keepers' Review upon the article of Adrian Getaz, (American Bee Journal, page 562), and thinks Mr. Getaz in error in assuming that a colony in a 12-frame hive would average 50 percent stronger than one in an 8-frame hive. His experience teaches him that the smaller the hive, within reasonable bounds, the stronger the colony in proportion to the amount of room. He is especially surprised that Mr. Getaz should think there would be less swarming from the larger hives. He thinks it must inevitably be greater, as he counts a large population the principal factor in the production of swarms.

Editor Hutchinson thinks the article by Mr. Getaz is so "sensible and fair" that he copies it, reserving, however, the right to think that even if it be true that as much honey *per comb* can be secured with the larger hive, there are reasons why Northern bee-keepers might prefer the smaller hive, the system of management being such that a small, readily movable hive is desirable, such a hive being especially desirable for cellar-wintering.

Getting Bees Out of Sections.—The following from the National Stockman is good advice for those who have no Porter bee-escapes, or have not time to wait for it:

Take a piece of cotton cloth large enough to cover the super and hang down two or more inches on each of its four sides when finished. On two opposite sides nail pieces of lath about as long as the super, and in the hem of the other two sides put buckshot to weigh it down. You have now what is called a 'robber-cloth,' which is very convenient to cover up frames of honey or brood when robbers are troublesome, for you can take it off or throw it on with one hand while holding a frame of honey in the other. To complete it as a bee-escape, make a pyramidal wigwam of wire-cloth with a hole at the top big enough so you can thrust your finger into it, cut a three-cornered hole in the center of your robber-cloth and sew your wigwam onto it. A

A FREE BOOK on Feed Cooking.

We are sending out to all interested parties who ask for it, a very entertaining and instructive little book on this subject. It deals with all phases of the subject—the cost, advantages and profit of the practice. Incidentally it tells about the

ELECTRIC FEED COOKERS

which are made of best gray iron castings and lined with steel plates, with boilers of extra quality galvanized steel. So made they require less fuel and heat quicker than all others. Made in three styles and five sizes, from 25 to 100 gallons capacity. Heavy stock—can fill orders instantly. Write.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric

Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low-down wagon at a reasonable price.

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel bounds, etc.; guaranteed to carry 4,000 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired, and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will. Write for catalog of the full "Electric Line" to Electric Wheel Co., Box 16, Quincy, Ill. Mention the Bee Journal.

good size is to have the sides of your tent, that is from the lower corner to the top, 10 to 12 inches. From one of the three lower corners to the next will be the same measure. Pile your supers of sections one on top of the other, then throw the escape over the top, and the bees will be all out in 3 or 4 hours. It is best not to make the piles more than 10 supers high, altho 15 high works pretty well. Five is still better than ten. Of course, the larger part of the bees are smoked down into the hive before the supers are taken off."

GENERAL ITEMS

A Good Oregon Report.

Last spring I started with 12 colonies in poor condition, and we had a cold, wet spring. I had 22 swarms, lost 3, and increased to 24. I doubled up some, and got 920 pounds of comb honey, half white. One colony produced 142 pounds, and another 103. They are black bees, and didn't swarm. My bees are mostly blacks, and some crosses. Bees are in good condition. Our main crop is from poison-oak.

M. W. PRUNER,
Douglas Co., Oreg., Nov. 21.

A Very Poor Season.

I have 60 colonies of Italian bees, and in splendid condition for winter. My crop of honey was 1,000 pounds of comb honey. It was a very poor season, with a cold and wet spring. G. P. UTENDORFER,
Sibley Co., Minn., Nov. 23.

Likes the Golden Method.

Bees have done nicely this year. The Golden method is all right. Last fall I put 12 colonies in winter quarters. I sold 2 colonies last spring, and from the 10 remaining I secured 600 sections of nice honey which I sold at 12½ cents each. I increased to 19 colonies, holding back swarming as much as I could by the Heddon method. The only colony which I managed according to the Golden method filled 112 sections; and the best colony by the other method produced 72 sections. I think if a person can spend all his time with the bees, and does not care for increase, the Golden

method for producing comb honey is all right.

I have built a shed to hold 50 colonies, and moved all my bees into it. I have discovered that it is too wet in this part of Washington to keep the bees outside on the ground. **A. F. FLUCKIGER,** Lewis Co., Wash., Oct. 27.

Poor Year for Bees.

My bees did well the past season. I had 9 colonies in the spring and have 16 now. From five I took 35 gallons of white clover extracted honey, and when the season ended I reared queens and divided colonies, as I did not have a swarm during the season. It was a poor year for bees. Honey is scarce and no one has any to sell but myself. I am wintering half of my colonies on the summer stands and the rest in the cellar. **C. J. YOBER,** Wayne Co., Ohio, Nov. 7.

Shorter Crop than for Years.

The honey crop in this county is shorter than for many years. My 102 colonies stored a little over 4 tons of surplus, which I sold for 6 cents a pound, all in a lump. I look for a good honey crop next year. We have had 3 inches of rain in the last two months. Wild flowers are in bloom, and bees are gathering some honey. **DAN CLUBE,** Tulare Co., Calif., Nov. 17.

Favorable Conditions in Utah.

While we have had an off year in Utah this year, some bee-keepers' bees have fairly boomed, while others have done little or nothing. Personally, I cannot complain. We are having beautiful fall weather, and while some of the bees are weak the conditions as a whole appear to be favorable. **E. S. LOVESTY,** Salt Lake Co., Utah, Nov. 24.

Report from Southwestern Iowa.

I commenced the past season with 25 colonies, 24 being good ones, and one very weak. I increased to 39 colonies, partly by division and partly by natural swarming, and got an average of 50 pounds of comb honey per colony, spring count, which I have sold at home for 12½ cents a pound. I have never shipped any honey off to market; I peddle it in the towns, and get the cash for it; as honey is scarce there is no trouble to sell it.

I have my bees packed for winter, with plenty of stores. I always winter them outdoors packed in leaves and fine straw, and they winter safely. It is nice and warm here, and raining today. The clovers are nice and green, and plenty of them, too. We look for a crop next year. **JERRY SCOTT,** Page Co., Iowa, Nov. 22.

Cleaning Up Unfinished Sections.

On page 716 I noticed an item about getting bees to clean up unfinished sections by putting them in a single super. The writer wants to know if any one has been successful by so doing. I had some unfinished sections and put them in a super and then placed them on a hive, and the bees cleaned out part of the honey. Then I put them on another hive and they were soon finished, not leaving a single cell that was not cleaned out nicely, and it was not over a week in being done.

I have 10 colonies but got surplus honey from only four the past season. As the spring was late and dry I got but little white honey. The most of the honey was gathered in the fall. On account of much rainy weather during the season bees had a poor chance to gather honey, but all except two colonies seemed to have honey. I had so much to do that I could not give them necessary care.

I will winter my bees as I did last winter as it was very successful, even as cold as it was then. I will put the same boxes on. I

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a small quantity of the seed of the **YELLOW** variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

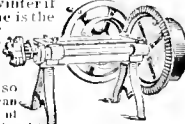

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us **ONE NEW** subscriber for the **American Bee Journal** for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

ESTABLISH A HOME OF YOUR OWN

Read "The Corn Belt," a handsome monthly paper, beautifully illustrated, containing exact and truthful information about farm lands in the West. Send 25 cents in postage stamps for a year's subscription to **THE CORN BELT,** 209 Adams St., Chicago.

read in an article that bees should not see sunlight in the winter; then my plan of last winter, of setting a wide board in front to keep snow from stopping the entrance, will answer two purposes—keep out the snow and also the sunshine.

I had only four swarms last season, and two of them left. That seemed to be the style around here, if the bee-keeper did not see them as soon as they came out; so I had an increase of only two colonies. I had made a number of hives last winter expecting to fill them with bees, so I will not need to make any this winter.

SARAH J. GRIFFITH,
Cumberland Co., N. J., Nov. 13.

A Short Experience with Bees.

I have been keeping bees about 3 years, beginning with blacks. Last spring I got a golden Italian queen and also two 5-banded queens, and they are all doing well. I now have 25 colonies in 8-frame hives. The weight of one frame of honey was 10 pounds, which would make 50 pounds to the colony, and this has been a bad season here for honey, altho this is the best country in the world for bees.

The way I manage swarming is to take the old hive away and put the new one in its place. I take one frame, with the queen, out of the old hive and put it into the new, letting the bees in the old hive rear a new queen. I think I can, from one good laying queen, rear a hundred during the season.

E. E. WILSON,
Swain Co., N. C., Oct. 12.

The Dead Bee.

Dead amid the dewy clover
Lies a bonny little rover,
Who could shape her course afar,
Without compass, without star.

Nevermore across the azure
Shall she sail in search of treasure;
Nevermore, when day is gone,
Home shall bide her galleon.

From the jonquil's golden chalice,
And the lily's ivory palace,
And the violets' divine
Cups of white and purple wine.

Smile, smile on, thou faithless summer,
To forget thine early comer.
Say, if thou hadst first departed,
Had she still been merry hearted?

On the boughs in rapture swinging
Gleefully the birds are singing.
I, who mourn thee, little bee,
Will pronounce thine elegy:

Be it meetness or unmeetness,
Thou didst garner up life's sweetness,
Wiser than the sages wist;
Earth has one less optimist.

—Alice Lena Cole, in Century.

[Mr. Peter Westrum, of Hamilton Co.,
Iowa, kindly sent us the above poem.—
EDITOR.]

Convention Notices.

New York.—The annual meeting of the Ontario County, N. Y., Bee-Keepers' Association will be held in Canandaigua, Dec. 14 and 15, 1899. All interested in bees or honey are invited to attend.
RUTH E. TAYLOR, Sec.
Bellona, N. Y.

Illinois.—The executive committee of the Illinois State Bee-Keepers' Association have changed the date of the ninth annual meeting to Dec. 26 and 27, 1899. It is understood that all the railroads will make half rates during the holidays. The State Horticultural Society and the State Teachers' Institute hold their annual meetings at the same time, and all at the State House, so that it will be a great inducement for a good attendance. We expect to have a fine program for the occasion, and a good time, as bee-keepers always do when they get together. Come, everybody!
JAS. A. STONE, Sec.
Bradford, Ill.

Vermont.—The Vermont Bee-Keepers' Association will meet in Burlington, Dec. 12 and 13.

Tuesday evening, Dec. 12, the program includes, "Bees, flowers and fruits," with stereopticon, by Prof. L. R. Jones, Vermont Experiment Station; "How to begin bee-keeping," by R. H. Holmes.

On Wednesday, Dec. 13, among the various numbers on the program are these: General discussion—"What have we learned the past season about bee-keeping?" "Most economical way to change queens, and best method of introducing them?" by W. G. Larrabee. "Are bees as capable of improvement as horses, cattle, or other animals or birds under domestication?" by J. E. Crane. "Is it desirable for honey-producers to adopt the Doolittle method of queen-rearing?" by R. H. Holmes. "Best method of building up colonies in the spring," by O. J. Lowrey. "Report on work done at Experiment Station apriary the past season," by Cassius R. Peck. "Best method of disposing of the honey crop in years of plenty," by Geo. W. Fassett. "Can the swarming impulse be bred out?" by H. L. Leonard.

There will be exhibits of fruit and of bee-products. These will be displayed in the assembly room, Experiment Station building, where the meetings are held. Everyone is strongly urged to bring something for these exhibits. The Central Vermont and the Rutland railroads have signified their willingness to grant the usual convention rates of one and one-third fare for round trip. Consult your station agent before buying your ticket. Burlington has several excellent hotels. Hotel headquarters will be at the Van Ness House, where the usual reduced rates will be granted. Everybody is cordially invited to attend. Ladies are especially welcome. It is believed that any one who will come will find the meetings interesting.
M. F. CRAM, Sec.
West Brookfield, Vt.

HATCHING CHICKENS—EASY JOB

when you know just how to proceed. When the courses are mapped out for you by others of experience. When you are told just what to do and how to do it and what not to do. All these things are completely covered by the master hand of experience in our

20th CENTURY POULTRY BOOK.

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 24.—There is a firm tone in all kinds of honey, even buckwheat sells easier than of yore. It is obtainable for the best white comb which we class as fancy, and 15c for No. 1 grade; stained and off grades of white, 13@14c; amber, 10@12c; and dark to buckwheat, 9@10c. Extracted white clover and basswood, 8@9c; amber, 7@8c; dark, 6@7c. Beeswax, 27c. R. A. BURNETT & CO.

CINCINNATI, Nov. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8½c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth

KANSAS CITY, Nov. 9.—We quote No. 1 white comb, 13½@14c; No. 2, 13@13½c; No. 1 amber, 13@13½c; No. 2, 12@13c. Extracted, white, 7½@8c; amber, 7@7½c; dark, 5½@6c. Beeswax, 26@27c. C. C. CLEMONS & CO.

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c gallon. Beeswax quiet at 26@27c. HILDRETH & SEGELKEN.

CLEVELAND, Dec. 1.—Fancy white, 16@17c; No. 1 white, 15@16c; No. 1 amber, 13@14c; No. 2 amber, 12@13c; buckwheat, 9@10c. White extracted, 8@9c. A. B. WILLIAMS & CO.

SAN FRANCISCO, Nov. 22.—White comb, 11½@12½c; amber, 8@10c. Extracted, white, 7½@8c; light amber, 7@7½c; amber, 5@5½c; Beeswax, 26@27c.

BOSTON, Nov. 7.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

We are pleased to note that our market continues in splendid condition. While the supply is light, yet, owing to the high prices, it seems to be quite equal to the demand. Later on when the trade realizes the shortage more thoroly the demand undoubtedly will be much better.

BLAKE, SCOTT & LEE.

ALBANY, Nov. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c.

MACDONALD & CO.

Successors to Chas. McCulloch & Co.

OMAHA, Nov. 18.—The November trade has up to the present not been as good as was expected, and shows a falling off from October. It seems that the somewhat higher prices this fall are affecting the consumptive demand to some extent, still the warm weather yet prevailing in this part of the country may also be partly responsible for it. While trade has been light, prices have been well maintained, nobody being burdened with stock to such an amount as to become oppressive.

Fancy white still going at 14@14½c, and light amber 1 cent less. Extracted, white, 8@8½c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8½c. Beeswax, 23@24c. M. H. BUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.
R. A. BURNETT & CO.,
33A20t 163 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected, delivered at Cincinnati. I pay spot cash on delivery.
C. H. W. WEBER,
Successor to Chas. Muth & Son and A. Muth.
40Atf 2146 48 Central Ave., Cincinnati, O.

CONTRIBUTED ARTICLES

Wild or Bee Aster and Some of Its Peculiarities.

BY JOHN R. SCHMIDT.

SEVERAL years ago, while studying the honey-producing plants of this section of Ohio, my attention was called to a plant which of late is rapidly forging its way to the front, and now promises to be quite a friend of the bee-keeper in this locality, especially with those who have colonies light in stores at the close of the main flow, which is derived from that well-known and much-abused sweet clover.

This plant, as will be seen from the photograph, is the wild or bee-aster, as it is sometimes called, and probably better known to some bee-keepers. At first it could only be seen in small patches scattered along the roadsides and waste lands, but now it can be found almost everywhere, more or less, and seems to be well established and spreading rapidly.

Wild aster begins to bloom late in August—about the same time as the goldenrod, but, unlike it, it continues to bloom until late in October, sometimes lasting until the middle of November, when it is usually killed by heavy frosts. At this writing (Nov. 15) there are still a few blossoms to be seen in the more sheltered localities.

Sweet clover and wild aster live and thrive on the same ground, and vigorous growths of each can often be seen intermixt, the wild aster starting to bloom when the last blossoms of the sweet clover fail, making a field of continuous bloom from June until the end of October.

Probably I would better explain more definitely as to the two plants growing on the same ground. I do not know how long they would prosper if sown together, or would I advise anyone to do such a thing, but this is just exactly what it amounts to here on the waste lands, both trying to crowd each other out, and each holding its own. The sweet clover being a biennial, gives the other an advantage in growth every other year, and probably this accounts for its rapid increase and steady encroach-

ment upon the clover-fields. Nothing but time will tell which one will survive.

Wild aster has several peculiarities which are worth mentioning, and one is very apt to deceive, making one think there are two varieties when in fact there is really only one. When the plant first begins to bloom the flowers are white, but after blooming for some time—I cannot tell how long, but probably depending upon the condition of the weather—the flowers change to a purple, which makes one think that there are two different varieties blooming together. This I thought was the case, but on closer investigation, when selecting specimens for my illustration, I found some plants with the two different colored flowers on the same stem, and when observing the same plants some time afterwards I found all the white flowers had disappeared, and the plants now had a profuse bloom of the purple flowers. This change became more rapid as the season advanced, and in a few weeks not a white flower could be seen.

Wild or Bee Aster.

As to the quality of the honey from wild aster, it is hard to say anything definite at present, but it seems to be of a rich, dark amber, and of very good flavor. When the honey is being ripened a very strong, peculiar odor is emitted from the hives, which can unquestionably be recognized at a great distance from them, on a calm, sultry day, usually within 300 feet of the hives. This odor makes its appearance at the very beginning of the bloom, almost before the presence of the flower is discovered, and lasts until it ceases to bloom. The flower itself is almost odorless, and entirely unlike that which is emitted from the hives. The bees work vigorously upon the blossoms, and even after being confined by cool weather they take to this plant as soon as the weather permits them to do so again.

Section honey will never be obtained here from this source, as the flow comes too late, and the weather is always against it. The growth of wild aster seems to depend very much upon the soil, as in some localities the plant is just the opposite from what it is in others.

Often it can be seen covering large stretches of land, with plants which are short and stubby, of a very uniform height, and rarely exceeding one foot; while in others this same plant often exceeds 5 feet in height, and has numerous small branches on the top of a tall, slender stem, very much like the golden-rod.

Hamilton Co., Ohio.

The Coal-Tar Products—Naphtha Beta, Etc.

BY PROF. A. J. COOK.

I HAVE received the following letter from the editor of the American Bee Journal, with request for a reply:

EDITOR YORK:—I am very much interested in all you can publish in regard to naphtha beta and naphthaline. Do you think if naphthaline were put into hives of healthy colonies in early spring, and kept there during the robbing season, that the germs of foul brood that would be brought from other infected hives would be kept from spreading in the healthy colonies until the bee-keeper would discover it, and have an opportunity to cure it while strong in bees?

If this drug will retard the disease so that it can be discovered and treated while a colony is strong, I can see how it can be of much service to those who produce honey in foul-brood localities.

Salt Lake Co., Utah.

GEO. E. DUDLEY.

The work of the German chemists in the last few years in developing or obtaining the great number of coal-tar products has been of great importance, and is far from the least of the invaluable services for which we are indebted to the savants of that great country.

Mr. Dudley wishes to know more of naphtha beta and naphthaline. These are carbonaceous substances, or hydrocarbons. The chemical formula is $C_{10}H_{8}OH$. This one is also known as naphtholium isonaphthol, and naphthol. The crystals are white, and are insoluble in water, but soluble in alcohol. They are derived from crude petroleum, and are most important in the arts.

The Tyrian purple used to be so expensive that only the richest could possess fabrics thus colored or dyed. Today the poorest can rejoice in the richest purple. The aniline dyes are so rich that their beauty is only matched by their cheapness. The variety of these colors is beyond belief. They are not only used to color various fabrics, as woolen, cotton and silk goods, but they are of extensive use in microscopic work. Various microbes are distinguished by their readiness to stain with these coal-tar products. Indeed, three of the most important stains used in studying bacteria are fuchsin, gentian violet and methylene blue. Another one, eosin, is used in histology as much as any stain, and is of inestimable value in developing cell-structure.

The coal-tar or petroleum products are also much used in the manufacture of perfumes. They are also used as antiseptics and disinfectants. Lest some may not fully understand the exact significance of these terms, I will define them.

A disinfectant kills or destroys the germs. It has been proven that disinfectants must come in contact with the bacteria to be effective.

An antiseptic prevents the development and growth of the germs. It may not destroy them. A disinfectant is of necessity an antiseptic. The reverse is, of course, not necessarily true.

A germicide is a substance that kills the germs—it is both a disinfectant and an antiseptic.

The naphthaline hydrocarbons are powerful disinfectants, and so are germicides, and of course antiseptics. Heat is one of the best germicides, and so of course a powerful disinfectant. Next to heat the substances in question rank high. They are among the carbolic-acid compounds, and are very much used.

As stated above, the disinfectant must come in immediate contact with the bacteria to be destroyed. It would seem, then, that the mere presence of naphthaline in the hive might not be enough. All these products are more or less volatile, and in case enough of the material volatilized to reach and kill all the germs, then the work would be done by placing the substance in the hives. But naphthaline is very obnoxious to insects. We use it to keep the dermestids and other cabinet pests from our collections of insects. I should fear that in case we placed enough in the hive so that the emanations were fatal to the foul-brood germs, we should drive the bees away, or, perchance, kill them. It would be more sure to give the bees the material in their food. This is the recommendation, as I understand it. It is found that enough may be fed to destroy the bacteria, and yet not injure the bees.

The old method to destroy this disease has been so thoroughly tried that we may rely on its virtue. In case foul brood is about us, and we fear the infection, then to feed beta naphthol in quantities harmless to the bees and yet sufficient to kill the bacilli, would doubtless be wise. If, as is claimed, 33 grains to 1,000 grains of liquid, or one in 3,000 is strong enough, surely it could not injure the bees. It is to be hoped that the spores are as susceptible as are the bacilli themselves. Thus, bee-keepers may well be interested in this beta naphthol. Stained by a related product

the bacillus of foul brood shows its presence, while the naphtholium itself is a germicide that bids fair to rid our apiaries of this worst malady that afflicts them.

THE DZIERZON THEORY.

The present outcry against the Dzierzon Theory makes me think of the once clamor regarding impregnation of the queen in confinement. So many had done it. They spoke positively, and no ifs were tolerated; but the most of us couldn't effect it. We did not believe they had. The outcry soon subsided. What bee-keeper of long experience had not had ample proof regarding this parthenogenesis in the production of male bees? Virgin layers, superannuated queens, laying workers, all speak authoritatively on the question. Drone-larvæ never develop into workers in my apiary, nor the reverse. Have they really in any apiary?

Los Angeles Co., Calif.

Queen-Excluders—Their Merits and Demerits.

BY H. H. HYDE.

I SEE that Mr. Doolittle advises the use of queen-excluders, on page 626; but I cannot agree with him. Their only merit is in queen-rearing, and here I find great use for them. Also, they are a good thing where the bee-keeper has only one flow of honey, but for the majority who have two or more flows queen-excluders are not only a nuisance, but reduce the crop of honey from one-third to one-half. My reasons are as follows:

1st. They retard brood-rearing. To gather honey it requires bees—the more in one hive the better the results. For instance, a queen-excluder is placed in the hive and the queen confined to one brood-chamber at the beginning of the honey-flow, as it was not needed before, as that hive did not need it because it did not have enough brood the season before.

But, to return the queen having only one story for brood, either comes out with (what I call) a small swarm, or remains to be crowded out. The colonies become weak and in no shape to get any flows of honey later; and right here let me say that many bee-keepers don't suppose they have a later crop of honey just because their bees are in no shape to gather it.

Now for the other side: Imagine a colony has been strong all the year, and is strong when it goes into winter quarters with plenty of honey and young bees. Such a colony comes thru in fine shape, and by March 1 brood-rearing commences in earnest, and by April 1 the bottom story is full of bees and brood; the bees and queen are allowed to occupy the next story for brood, it having been left on with honey in it all winter. Now, isn't it plain that these bees, reared now, are the ones to catch the honey-flow from May 1 to June 15? When this flow comes they go to piling in honey with a rush; the queen is allowed to go where she pleases, and honey is extracted wherever it is found. You may say this will result in a poor article of honey, but I say it will not, as it is not necessary to extract from combs containing young larvæ. (An expert can extract without injuring young larvæ.)

You may say this course will result in a lot of useless consumers. Not so. We wish brood-rearing pushed until Aug. 15, at least, to get the flow from July 15 until frost. With queen-excluders our colonies will be so weakened that they would not store any surplus during this last flow.

A Visit to a Cuban Apiary.

BY HARRY HOWE.

I AM just back from a visit which Walter Somerford, Fred Somerford, and myself, paid to a Cuban apiary. This is located two or three miles from the coast, and about 15 miles from Havana. About the time we turned off from the good stone road it began to rain. The red clay soil here makes the worst mud I ever tried to ride a wheel thru. It was not long before we left our wheels by the roadside and went on foot.

The apiary—when we got to it—was under the shade of a fine old grove of trees. Everything was as clean and neat around it as possible. The whole space occupied by the bees was kept clear of leaves and weeds. The whole aspect of the place showed that the owner was a man who tried to have things right.

The hives were about five feet long and one foot square,

open at both ends. They were laid very nearly level upon scantlings 18 inches from the ground. The posts which supported these frames were set in cement. This bed of cement was turned up in a ridge on the out edge, making a sort of basin a foot across, in the middle of which the post arose from an island of cement. The basin was filled with water. The frames for the support of the hives were all painted with tar.

The rows were perfectly straight and regular, and were exactly the same distance apart thru the apiary. One could sight over the corners of the hives in any direction and find them all in line. Take it all together, it was one of the handsomest apiaries I ever saw.

The owner, Senor Manuel Querido, said that he fixt them up so as to keep out the ants. He had lost a good many colonies lately, and thought the ants were to blame. Upon further enquiry it turned out that he had lost 125 colonies the past summer. Many of those left did not seem to be in good shape. They had an air of not caring what became of them. These and various other symptoms led us to ask the owner if he knew about foul brood, but he said he had never heard of it.

Of course we did not dig into the bees to see for ourselves, but later on, when we get a foul-brood inspector, he will.

There were about 200 colonies still in working order.

Senor Querido showed us his extractor, which was a sort of reversible affair, and took the honey out of the combs both sides at once. As the honey is taken from the hives it is placed in open baskets. These are set over a big trough made from a hollow tree and fixt so the honey will run into a big cask. Then the combs in the baskets are all masht fine with a big masher, and the honey allowed to drain out.

To get the honey out of the hive he uses a long iron rod with a sort of chisel on one end and a sharp-edged hook on the other.

The wax product in Cuba is large. One firm has a regular trade of 10,000 pounds a month.

One of the problems here for the foul-brood inspector will be how to treat the colonies in box-hives.

Province of Habana, Cuba, Nov. 10.

Straw Mats—How Made and Used.

BY C. P. DADANT.

ON page 743, I see that the question is askt as to how we can have ventilation in our hives if we pile them on top of one another in the cellar, with a straw mat between them. The question would naturally arise in the mind of any one who does not know how our hives are made, and Dr. Miller's explanation is not quite sufficient to remove the doubt.

The hives that we use are made with an extension downward on three sides of the bottom-board, that is, on all sides but the front, so that, when the bottom is removed, the hive extends about 1½ inches below the bottom of the frames. This extension is intended to shed all moisture on the back and sides, and to make a better joint of the body with the bottom.

As a matter of course, when our hives are piled in the cellar, on top of one another, this projection below gives a sufficient distance between the bottom of the frames and the straw mat of the next hive below to insure a very plentiful ventilation. But the straw mat itself is very porous, and a good ventilating implement, and I wish to say a few things in its favor. I do not know of any one outside of our own disciples, except the late Chas. F. Muth, who used the straw mat in this country. Yet it is the most unanimous verdict of all who have tried it that it is a very useful, a very inexpensive, and a very durable implement.

America is renowned for her enterprise, for the readiness with which she takes hold of any implement or any improvement which is brought to her by her many immigrants from all parts of the world, and it is held justly, I believe, that it is this readiness of adaptability, together with the many and various customs and ideas brought over from all parts of the world, which make America's progress so markt. Yet there are a few things in which America's progress has been slow. It took a quarter of a century to show our Western farmer, or business man, that his dyspeptic feeling was caused by the incessant repetition of fried bacon and hot biscuits three times per day. A good, palatable stew was despised, and pork, beef, mutton, chicken, rabbit, duck, etc., were fried, fried, fried—much to the dam-

age of the American stomach, and of the quality of some of the dishes. "You can't work your French dishes on me, Mr. Dadant," said a young Hoosier housekeeper to me; "I can't go your liver and kidneys, and cow-bag and tripe, and those little minnies with castor-oil on 'em" (French sardines). "No, sir-ree!"

Well, the world is moving, and we can now eat "canard aux navets" and "gigot à l'ail" in American homes, even here in the West, and the best of it is that the people think it is good.

Beg pardon, Mr. Editor, I did not mean to run off in this way. Let me see, it was straw mats I was talking about.

Well, I believe it ought to be with the straw mats as with the cooking, our Americans ought to try them, and I'll warrant they will think them good.

I call them *straw* mats, but we make them of slough-grass (put it "slu," Mr. Editor), because it is stronger and easier handled than straw; but I believe mats made of good rye-straw would be better.

The mat over the oilcloth in the summer keeps the heat off better than a two-inch plank. In the winter, if placed right over the bees, it absorbs moisture, allows it to pass thru without letting the heat escape. If it gets wet thru a leak in the hive-top it readily dries up, does not rot like the material of a chaff or sawdust cushion, and the bees do not eat any holes into it as they do in the material of which chaff cushion is made. Yet, I am free to acknowledge that the latter is a little better than the straw mat, fits better over the frames, and keeps the heat and the cold off in fully as good a fashion. But we have discarded the chaff and sawdust cushions for the very reason that, unless they were made of very heavy material, the bees would soon pick them full of holes and change them into a nuisance.

The only drawback I can see to the straw mat is the difficulty of fitting it over the frames when the hive is made, like many hives of the present day, with the super or cover fitting exactly over the body. Our hives are all made with a telescope cap, which gives us much more surface at the top, and the irregularities of a straw mat are not in the way.

Some of our old European bee-keepers use straw-mats, not only in the hive, but around it, as a winter shelter. An old French bee-keeper living but a few miles from us, who had been a market-gardener in the vicinity of Paris in his younger days, had made a number of straw mats two feet in width, and some 5 feet long, with which he wrapt each of his hives at the opening of winter, leaving but a narrow opening in front for air and sunshine. During the summer he kept the mats piled up in a shed with wood ashes sprinkled between them. He said that this kept out the mice, as the fine ash-dust was unpleasant to them.

In Europe they protect not only bees, but hothouse roofs, chicken-coops and trees in espaliers, early vegetables and hotbed plants, with straw mats of all sorts and sizes.

Hancock Co., Ill.

Success in Wintering Bees on Deep Frames.

BY EDWIN BEVINS.

MR. HASTY, in "The Afterthought," on page 647, seems to think that some of my success in wintering bees on frames deeper than the Langstroth may be due, or partly due, to the increase size of the brood-chambers instead of being altogether due to the increase depth of the frames. When I take into consideration the fact that I have used for several years quite a number of these hives with the deep frames, and that these hives have been of varying capacities—some taking 8, some 9, and some 10 frames—I think I can form a tolerably good judgment with regard to the cause for the better wintering of the bees. I use some hives 12 inches deep, taking 8 frames the same as the Langstroth-Simplicity and dove-tailed, and have never lost a colony that was wintered in one of them, on account of a deficiency of stores.

If any one has kept bees long in hives of this size, he cannot have failed to observe that there is always, at the approach of winter, a good deal more honey above the space in the combs devoted to brood-rearing than there is in combs of the Langstroth depth. While the space used for brood is about equal in both kinds of frames, the honey between the upper edges of the brood-cells and the top-bars of the frames will be about two inches wider in the deep frames than it will be found in the Langstroth frames.

It seems to me that this increase amount of honey cuts

more of a figure in the matter of successful wintering than does the little additional room in the brood-chamber.

The Langstroth hive is 9½ inches deep. The hives which I use, and which I am comparing with the Langstroth, are 12 inches deep, both taking 8 frames. The deeper hive has about 540 cubic inches of space more than the shallower one, and this space is largely taken up by the additional amount of honey which the hive contains above that which is contained in the smaller hives. Just how much credit is due the remaining additional space for the successful wintering of the bees I leave each one to judge for himself. I give the credit to the honey, and not to the space.

If added size of brood-chamber, aside from its use as storage-room for added stores, contributes anything to the successful wintering of bees, it seems that many who use deeper hives than the Langstroth have not found it out. Their practice is to contract the brood-chamber to correspond with the size of the brood-nest.

DeCATUR Co., Iowa, Oct. 31.

Why the Widely Differing Views of Apiarian Writers?

BY DR. C. C. MILLER.

PARTLY for lack of time, and partly because I wanted to make further investigation, I have not sooner replied to some things said some time ago by my good friend, G. M. Doolittle. A rather common question for beginners to ask is: "Why is it that such widely differing views are given in the bee-papers by different writers?" I think there are at least three reasons for difference of views: Difference in locality, difference in bees, and errors of opinion. I don't know just how much each of these figures in the differences between Mr. Doolittle and myself, but I am sure we are both after the truth.

RECEIVING CRITICISM KINDLY.

And that reminds me of a question Mr. Doolittle asks me on page 484:

"Does not the Master enjoin on his followers that they have grace given them from on high to receive kindly any criticism, or anything else, no matter whether given in the spirit of kindness or not.....?"

I don't know whether I can give the exactly correct answer to that question. My idea of receiving kindly is that when I receive anything kindly from any one I am thankful to him for it. If a man tries to kill me, I don't think I ought to try to kill him in return (unless it might be to save my own life), but I wouldn't feel under any special obligation to offer him a resolution of thanks for his murderous attempt. Neither do I think I am expected to have exactly the same feeling toward one who shows up my faults with the sole object of humiliating me, as toward one who with a spirit of kindness wants to show me the truth. At any rate, I hope there will never be anything but a spirit of kindness between us, Mr. Doolittle.

HIVING A SWARM WITH A NUCLEUS.

On page 371 Mr. Doolittle speaks of hiving a swarm with a nucleus, and says:

"There is only one way which I know of without having many bees killed and making a general 'muss' of it all around;" and that way is to have all the queens with clipped wings, and when a swarm issues to set the old hive in place of the nucleus, setting the nucleus on the old stand, after first smoking its bees so as to get them to fill themselves with honey; then when the swarm begins to return, to shake the bees and queen of the nucleus on the ground a foot to 18 inches from the hive, and all will unite peaceably. "If you do not take these precautions," says he, "the bees in the nucleus would kill the bees from the swarm as fast as they came back, in nine cases out of ten."

I read that with some degree of surprise, having many times united a swarm with a nucleus in a simpler manner, as follows: When a swarm issues, take the old hive from the stand, disposing of its queen in any way thought best; set the nucleus on the stand whence came the swarm, and let the bees do the rest. In other words, I did not take the precaution to shake the bees off the nucleus on the ground. Before moving the nucleus I always gave it a little smoke to keep the bees from stinging me. I had never noticed the bees fighting, but as I had not given the matter very close attention, and this was only June 15, I thought I would watch carefully, in case I had the opportunity, during the

rest of the season. I had the opportunity in four different cases in the month of July, but could see no fighting whatever. I do not understand why it is that in nine cases out of ten the entire swarm should be killed for Mr. Doolittle, and none at all for me. Hon. R. L. Taylor's experience agrees with mine.

METHODS OF MAKING NUCLEI.

On the same page (371) Mr. Doolittle says four quarts of bees will not make a good nucleus, that is, the bees will not stay unless precautions are taken, but that one quart will make a good nucleus if the bees are imprisoned 48 hours and fed, or if brought from an out-apiary and imprisoned 24 hours. If I should take four quarts of bees without any precaution, and put them on a frame of brood and one of honey, I think enough would remain to make a fair nucleus, but as I have not actually tried for years taking bees from a hive with a laying queen to form a nucleus, I am not positive about it. It may be that the kind of brood has something to do in the case. But I am very positive I would not take the trouble to imprison bees to form nuclei. If I take two frames of brood with adhering bees from a queenless colony and put them in an empty hive, plenty of bees will remain to make a good nucleus. I have formed nuclei by the hundred in this manner. If I have no queenless colony, it is easier to make one queenless than to imprison the bees. I think it is W. W. Somerford who says his bees will desert the nucleus, and he thinks the difference is in the kind of bees.

LOSING A QUEEN BY HIVING A SWARM WITH A NUCLEUS.

On page 484, Mr. Doolittle wants me to tell where I got from his article the idea that if "Iowa" hived a swarm with a nucleus, he would "lose a queen by the operation." Mr. Doolittle, I didn't get it from your article, and you would never have thought so if you had had time to give the matter proper attention. But you wrote it in July, when, no doubt, the bees were making heavy demands on your time. I had no reference to your plan. I was trying to show that he did not mean to hive a swarm in a nucleus, and said *if* he did so he would lose a queen, and we have no right to suppose he had your plan in mind, else why should you give him the plan afterward?

I think that very often such misunderstandings occur from the fact that one person has one thing strongly in mind, the other another, each supposing the other is looking from the same standpoint. You had your plan strongly in mind, and I was thinking only from "Iowa's" standpoint.
McHenry Co., Ill., Nov. 28.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 773.]

Sec. Mason then read the following paper by Mr. N. E. France, of Wisconsin, on

Foul Brood Its Detection and Eradication.

Most bee-keepers who care enough about the welfare of their bees to attend bee-keepers' conventions, and carefully study their books and publications on modern bee-culture, almost without exception know how to detect and eradicate this dreaded and contagious disease.

Often I find practical bee-keepers who are so busy with their many duties, and not having paid attention to the valuable articles written on foul brood in their papers on bee-culture, think their bees are all right, but because they did not do as well as in former years attribute it to bad luck or poor seasons. Upon my examination of such apiaries I find, to their surprise, foul brood in several hives.

Again, so often I am asked if foul brood is near their apiary, and if I answer no they release all care or fear, and do not inform themselves so as to be able to detect it should

N. E. France.

it ever appear. I have cured cases of foul brood in Wisconsin that were imported to our State from some of the most distant States in the Union.

While speaking on this subject I wish to call attention to the great need of national laws, or at least that each State have a law on this subject that will provide for its eradication. As Wisconsin State inspector of apiaries I feel as if I were, so to speak, one of the great United States colony of bee-keepers, and by the united efforts of my sister States, this disease could be stamp out. As it now is I often get discouraged when I find new cases that were just imported from other States.

For the health and prosperity of mankind we have laws in each State to quarantine and properly care for all contagious diseases; even laws to provide for experienced veterinary surgeons to examine any diseased farm stock, and prescribe what to do. If this is just and right, why not have laws that will protect our bees, the sales from which form the support of a multitude of people?

Many times have I found hives with diseased combs in them containing honey, the bees dead from foul brood, and bees from other apiaries taking home the disease. Now Wisconsin bee-keepers have legal protection, and compel such parties either to cure the disease or burn it. From the good that several State laws have done for bee-keepers is it not time we all join hands and secure such laws as will protect our life support?

Any one who has carefully read the many articles from Cowan's British Bee Journal, or even the many American writers, such as Dr. Howard's pamphlet, McEvoy's annual reports, and Mr. R. L. Taylor's experiments, will certainly know how to detect and eradicate foul brood.

N. E. FRANCE.

Dr. Mason—I have had a good deal of experience with foul brood. Twenty years ago the present month we moved from the southern part of Ohio to Toledo, and the following spring added to our apiary by buying eight or ten colonies of bees, and with them got foul brood in two or three colonies, as I afterwards learned to my sorrow. During the summer of 1880, I noticed when passing some of the hives, a peculiar odor, which I afterwards learned was foul brood. In the next three years the number of colonies had increased to about 80, with only three or four badly affected, and not until the winter of 1893-94 did I learn how to cure the disease. At the beginning of the next season I extracted the honey from all the combs that had no brood in them. I shook the bees from all the good colonies into clean hives and gave them starters. The combs with brood in them were given to weak colonies, adding one, two, or three stories, as seemed best. These storied colonies were made queenless and left 21 days for all the brood to hatch, then treated as the others had been, to clean hives with starters. Each of these colonies had reared a queen which commenced laying a few days after they were placed in the clean hives. I then extracted the honey from the brood-combs in the storied hives. As soon as I had extracted the honey from the first combs containing no brood, they were thrown, frames and all, into a caldron kettle of boiling water, and the frames were removed as soon as the comb was melted. The same treatment was given the frames and combs from the storied hives. All the hives were afterward boiled in the same kettle. The first honey extracted was boiled and fed back to the bees. The honey extracted from the combs in the storied hives was so thick with the foul brood matter as to make it ropy, so that when being poured from one receptacle to another it was difficult to keep it from all going together. This was also boiled,

strained, treated to a solution of salicylic acid, and fed to the bees, and there has not been a sign of foul brood in our apiary since. I don't believe the frames were in the boiling water (and wax) to exceed two or three minutes—just long enough for the combs to melt—and the hives were not boiled to exceed five minutes. In boiling the honey I took pains to have it *all* boil by dipping up the boiling honey and pouring it on the sides of the boiler, and so washing down into the boiling honey any that might be on the sides above that which was boiling; and this constant dipping kept the honey from boiling over. We see much in the bee-papers about boiling foul-broody honey for two or three hours, or even longer, and Dr. Miller, here, is one of those who advises long boiling. I believe the trouble comes from not being careful and particular enough in the boiling—perhaps paying no attention to that which may be on the sides of the boiler, above what is boiling. I believe that to *boil* foul-broody honey, *regardless of the time the boiling is continued*, will cure the disease. Some of my colonies were a rotten mass of foul brood, but my first attempt at curing it was a complete success. In boiling the hives and frames I took great pains when handling anything that was or might be foul-broody, not to touch anything with my hands, or anything else used in handling foul-broody things, until they had been disinfected with salicylic-acid solution. It seems to me that where there has been a failure when boiling has been resorted to, there must have been a lack of care somewhere. A careless person has no business to attempt to cure foul brood, for he will surely fail. With me a solution of salicylic acid and borax is as sure a cure for foul brood as is boiling. Mr. France, in his paper, advises burning as a cure, and within a few lines says, "I don't believe in burning honey." I am in full accord with his last statement. I don't believe it is *necessary* to burn anything in connection with curing the disease, and still I have no doubt but with some who keep bees, and have diseased honey and brood, the *safest* way is to make a bonfire of all contaminated things—bees, combs, honey and hives—and the best time to make the bonfire is at night, when the bees are at home.

Mr. Root—I would like to ask Dr. Mason how many colonies he treated at one time.

Dr. Mason—I think I was three days (having a boy to help) in treating about 80 colonies.

Mr. Root—How much honey did you boil?

Dr. Mason—I think about 50 gallons. The bees were in bad shape, some of the colonies having very little honey, and none of them very much.

Mr. Root—That might do for a small bee-keeper, but with a large apiary we recommend to burn the cases and burn the combs. Dr. Mason would likely be careful. There are two stages—the spore form and the bacilli. I don't know which form your bees had. If they had the spore form you could probably cure it by boiling.

Dr. Mason—I don't know the difference between spore and bacilli. Of course, we expect people will be thoro in this. I tried some experiments. Some one recommended spraying the combs with a salicylic-acid solution, but it proved a failure. When I was thru extracting that foul-broody honey I closed the extractor, and it was not opened again until last month, when being in need of an extra extractor I took that one to pieces as much as possible and gave it a thoro washing with salicylic-acid solution, and I have no fears of foul brood from using that extractor.

Dr. Miller—Dr. Mason has quoted me as saying that we should boil a long time. I am a mere parrot. Some say a long time; others, a short time; but to be safe I believe in doing it thoro. I am on the fence.

Mr. Root—I am clear off the fence.

Mr. Cook—Dr. Mason spoke of something being ropy. Does that affect the honey?

Dr. Mason—No.

Mr. Howe—I have been at work in this matter of dealing with foul-broody honey for months. I have boiled it long and short, but I have never had the spores grow after 15 minutes boiling. After 7 minutes boiling it may grow again. When I finally closed up my work in the laboratory I had a whole lot of all sorts of things, and put everything in the steam bath. Everything was dead; 15 minutes will kill the germs if boiled, or at boiling heat.

Pres. Whitcomb—I have not done much else this summer but hustle with foul brood. When I was absent it got started. We haven't lost a single case. It must be treated when other bees are not flying. We extracted the honey and put the frames in boilers and boiled them, then put them out to cool. In boiling honey I don't think any one will ever leave the cover on the boiler very long, for it will

boil over, and the more you stir it the more it will boil. The boiling point depends upon the altitude. We are 2,000 feet above the sea now, and the boiling point is not as high as in lower altitudes.

Mr. Howe—I took about 200 samples, but the lowest temperature was 225 degrees, the highest 235. Our altitude is about 900 feet.

Mr. Root—What was the temperature?

Mr. Howe—I think 228 degrees was the average. It is a good deal of fun to experiment.

Pres. Whitcomb—I tried boiling on the kitchen range. That is how I lost my hair. [Laughter.] Temperature has a good deal to do with it, but if it is thoroly done I don't think you will have any more trouble. When we left home our hives were full of honey.

Mr. Abbott—I would like to ask Mr. Whitcomb if he doesn't think there is danger of the foul brood appearing yet? Has a long enough time past to show?

Pres. Whitcomb—We have examined them very carefully, and there are no indications of any disease. I understand that foul brood grows very rapidly—will appear in a few hours after infection. But I find that in examining them closely young bees are hatching, and no signs of foul brood.

Mr. Abbott—The reason I askt the question was, I had never had much to do with foul brood, and I am glad of it. I knew a man whose bees were troubled with it, and he came to me for advice. I told him that the best thing he could do was to build a fire around the infected hives. But that lookt wasteful to him, and he came down several times and thought he had everything all right, but it would crop out again. It reminded me of a story of a Philadelphia doctor that my father used to tell about. He wanted to see a noted doctor, and said to a man, "Can you tell me where Dr. Jones lives?" "Ye-es-s-s-sir, he l-l-l-l-lives ri-right up there." "Is that the noted doctor who cures stuttering?" "Ye-ye-yes s-sir, he c-c-cu-cu-cured me!" [Laughter.] *Burning cures foul brood.*

Mr. Root—My experience is that a few bees will go back. I was speaking about it to Mr. Howe. He is too bashful to speak about it. Some will not be careful enough in treating the disease. The 15 minutes boiling is not too long. If the boiling is carried on carefully for 15 minutes perhaps that will be enough.

Pres. Whitcomb—Do you think the spores exist in wax?

Mr. Root—I don't know. We have since been sending out a circular recommending the McEvoy treatment. It requires very careful handling. Kerosene treatment is good, but the bees object to it.

Mr. Hutchinson—Did you ever try to put the bees on full sheets of foundation. Mr. Whitcomb?

Pres. Whitcomb—No.

Mr. Hershiser—How many batches did you treat at a time?

Pres. Whitcomb—Sometimes as many as 35. Some of the neighbors' bees had it, and we put them into our hives and brought them home and treated them there.

Dr. Mason—I found that I could treat foul brood and let the bees go into the fields at the same time. I have fed foul-broody honey that had been treated with salicylic acid and cured the disease. Mr. Howe says 15 minutes boiling is enough. He is a practical man. He does not sit down and let things run themselves.

Mr. Hershiser—I thought my bees had foul brood the past summer. It didn't prove to be foul brood, but I think that with care in treating it, it can be eradicated.

(Continued next week.)

Report of the Northern Illinois Bee-Keepers' Convention.

The annual meeting of the Northern Illinois Bee-Keepers' Association was held in Rockford, Oct. 17 and 18, 1899. The convention was called to order with about 25 members present, and the report showed 950 colonies of bees in the spring, with 1,150 colonies at the present time, and about 22,578 pounds of honey produced, most of which has been sold at 15 cents per pound for comb honey.

The program for the day opened by a song from the daughters of the president, Mr. S. H. Herrick, also one from Mr. N. E. France, of Wisconsin.

After the address by Pres. Herrick questions were in order, among those askt and answered being the following:

CAUSE OF WINTER LOSS OF BEES.

QUES.—What, in your opinion, was the cause of the mortality among bees last winter? ANS.—Poor grade of honey and the extreme cold.

Mr. Highbarger, who was successful in wintering, said: "Give plenty of ventilation, use loose-bottomed hives with cleats on the underside, which are reverst in winter to give more space at the entrance."

Mr. France extracts all dark honey, and feeds only white.

PLAIN SECTIONS AND FENCE SEPARATORS.

Some liked the plain sections and fence separators, while others were of the opinion that they were fads gotten up by dealers.

BEE-SMOKERS—GETTING RID OF ANTS.

QUES.—Which is the best smoker?

Mr. Highbarger said the Bingham. Mr. France thinks the Crane the best, but as it is pretty expensive he recommends the Corneil. He also cautioned against the use of tobacco in the smoker, as it has been known to taint the honey.

QUES.—What is the best method of getting rid of ants in the apiary? ANS.—Kerosene or camphor rubbed around the edge of the hives, or bi-sulphide of carbon put in their nests.

BEE-STING REMEDY—OWNERSHIP OF ABSCONDING SWARMS—TAXING BEES.

QUES.—What is the best remedy for bee-stings? ANS.—Whiskey, in severe cases.

QUES.—If a swarm leaves your premises and alights in an adjoining lot, can you remove your bees? ANS.—Agreed that you could.

QUES.—Are bees taxed in Illinois? ANS.—Not generally, but most thought it a question which the assessor in each town decided for himself.

EXHIBIT OF APIARIAN PHOTOGRAPHS.

Mr. France showed several hundred photographs of prominent bee-keepers of Wisconsin, among them several ladies. Miss Candler and Mrs. Pickard were both successful in the business, and Mrs. Pickard had about 50,000 pounds of extracted honey last year. He also showed a sample of foul-brood comb. Mr. France has treated 4,000 colonies for this disease in the three years he has been State inspector of apiaries.

A resolution was unanimously adopted recommending to bee-keepers Geo. R. McCartney's combined foundation fastener and section press.

The following officers were elected, and the meeting adjourned till next year:

President, S. H. Herrick; vice-president, J. Stewart; secretary, B. Kennedy; and treasurer, O. J. Cummings.

B. KENNEDY, Sec.

PEPE—"No, ma'am, I don't like bees. Nearly got killed by one once."
MISS ABBEY—"What! a honey-bee?"
PEPE—"No. Lynching bee."—Collier's Weekly.

The Premiums offered on page 796 are well worth working for. Look at them.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Trouble with Wood Splints in Foundation.

I tried a few frames with wood splints to prevent sagging of foundation. In some of the frames, especially some shallow extracting-frames, the foundation bulged out between the splints. It did this before being put on the hive. It did not seem to sag, but to swell out as a piece of wood would do when wet. I had the foundation cold when putting it in the frames in order to handle it more easily, and warm weather may have caused it to expand. Can you tell me how to prevent this trouble? I like the plan with this exception.

NORTH CAROLINA.

ANSWER.—Your question beats me. I hardly think that foundation expands sufficiently to be noticed when it is heated. It may, of course, stretch, but in that case it doesn't shrink back again when it gets cold. You say the expanding was greater in the shallow frames, and one would have expected the opposite. Possibly some one else can help out.

Red Cedar for Hive-Making.

Would you advise using Washington red cedar as a material for hive-making? Without considering the cost, do you think it would in any way prevent moths? Of course, I know there is no excuse for a practical bee-keeper having moths in his apiary. I am a young bee-keeper, 17 years of age, and this is my second year. I have 34 colonies. Last winter was very severe, but I did not lose a colony. I got about 300 pounds of comb honey this season, which was poor for the number of colonies.

WASH.

ANSWER.—If I am not mistaken, Washington red cedar is the same lumber as that of which shingles are made and brought to this part of the country, and I know of no reason why it would not be all right for bee-hives. I know nothing as to its efficacy in keeping out moths, but I should have no faith in it. There is a popular notion that furs and woollens put in cedar chests are safe from clothes moths, but bee-moths are not the same, and it is doubtful whether cedar wood is any better than other wood for keeping out any kind of moths. Any chest will keep out moths if it is moth-tight and the stuffs are put in free from moths.

Questions on Wintering Bees.

1. A friend of mine says he heard you say at a bee-convention that you used a two-inch rim made of 7/8-inch lumber under each hive for dead bees and rubbish to fall into during the winter months. Do you still consider it a good thing for either the cellar or out-door wintering?

2. I use the Dadant hive, and my bees are in extra-line condition at present. The tops of the brood-frames are covered with old carpet nicely fitted on and glued tight with propolis. I expect to winter them on the summer stands. I live in a sheltered place, but will set a row of corn-fodder on the north side. Do you advise any change? If so, in what way? Would it be better to leave the hive-entrance open, or partly closed? The entrances to the hives are 8x3/8 inches.

ILLINOIS.

ANSWERS.—1. Most decidedly. I think it a good thing in the cellar to have a two-inch space under the bottom-bars. Perhaps it would not be so good out-doors. If the bees wouldn't build down into it, I'd be glad to leave the two-inch space summer as well as winter. But they will build into that space, so I have practiced reversing the bottom-boards for summer. The latest plan, however,

is to leave the bottom-board the year round with the deep side uppermost, and in summer put in a sort of false bottom to fill up the space. After trying some of these for two years, I feel quite favorably inclined toward them.

2. Perhaps you will do well to make no change in your plans, especially if those same plans have been successful in previous winters. I think I would leave the entire 8x3/8 entrance open.

House-Apiaries.

1. Are house-apiaries any better than out-door apiaries?
2. Would it do to have bees in an upper story of a building when the lower part is used for something else?
3. How do you arrange for the entrances? Mo.

ANSWERS. 1. There are a few bee-keepers who value house-apiaries highly and are successful with them. Others prefer hives in the open air.

2. Bees may be kept successfully in the upper story of a building while the lower story is occupied. That is, they may be successfully kept thru the summer, but in most cases the wintering would not be so successful.

3. A canal of any kind may be made that will allow the bees to pass freely from the hive to the outer air, but will not allow any bees to get from the hive inside the building.

Starting in Bee-Keeping.

As I intend to start in the bee-business some time between now and next spring, I would like to ask a few questions, as I have had no experience with bees as yet. I wish to produce comb honey exclusively.

1. What kind of bees should I get?
2. Where are the best places to get them?
3. How many colonies should I get to start with?
4. Would I better get them now, or wait till spring?
5. What kind of hives would I better get?

I have lived here about a month; my home is on the banks of the Black River. I know of no one near here who keeps bees, and I think from the surrounding orchards and timber lands that it would be a good place for them.

MICHIGAN.

ANSWERS.—1. Probably nothing will be better than to get Italians. If black bees are plenty around you, you will be likely in a short time to have mostly crosses or hybrids, but they will render a good account of themselves.

2. Before time to get them, you will find plenty of reliable dealers represented in the advertising columns of this journal. If you already have bees and desire to get a queen or queens to improve your stock, then it doesn't matter much whether you get from near or far, the postage being the same, altho the preference should be given to one not too far off. But if you want to get a full colony of bees, then it makes a great difference, for express charges are enormous when bees are shipped a great distance, so, other things being equal, the nearest place is the best.

3. Better not start with more than two.

4. Don't think of getting them before spring. The risk of wintering will then be over.

5. Perhaps the 8 or 10 frame dovetailed; not because necessarily better than everything else, but because good, and, being among the most common in use, easily obtained.

When is it Best to Move Queen-Cells?

When is the best time to move a queen-cell so as not to injure the queen?

WISCONSIN.

ANSWER.—Your question probably refers to the age of the occupant of the cell, for the time of day makes no difference, except that the cell should not be handled at a time when there is danger of chilling the young queen. With sufficiently careful handling there is no danger at any stage of the queen's growth, but if the cell should be dropt at a certain stage there might be a deficient leg or wing. The worst time would probably be soon after sealing, and the nearer maturity after that time the less danger.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. DECEMBER 14, 1899. NO. 50.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

What this Journal Stands For.—We think we are not often given to self-flattery, nor to praising unduly the qualities of the American Bee Journal. We always prefer to allow others to extol our virtues and those of this journal, if there are any such that deserve mention.

In the first place, we want this journal to stand for the right and against the wrong, all the time. It is here, also, to represent the interests of the great industry of bee-keeping. It does not push any particular bee-supply business, but gives to each and every dealer and manufacturer who patronizes its advertising columns a free and fair field. Its publishers do not, thru its columns, enter into competition with those bee-supply dealers who pay their money for advertising space. Hence, the American Bee Journal is not a "house-organ"—used to boom the sale of bee-keepers' supplies in the interest of its publishers, as do some papers—but it endeavors to give, every week, lots of the best information obtainable for the advancement of practical and profitable bee-culture.

We say the foregoing because we know better than any one else the motives back of the printed pages of the American Bee Journal, and we believe that we need only to remind bee-keepers thruout the land that this journal stands for their interests, when they will continue to give it their loyal support. Not only will they do that, but we believe they will do what they can to extend its circulation, and thus aid in greatly widening its usefulness and helpfulness among the bee-keeping fraternity.

The time for renewing subscriptions for another year is

now here. We want to invite every one of our present subscribers to go on with us in 1900, and also suggests they get their bee-keeping friends and neighbors to "enlist" with them.

Remember, you will receive 52 copies of the old American Bee Journal for only one dollar. While nearly everything else is going up in price these days, this journal for 1900 will be mailed for the usual low amount—a dollar bill.

We are hoping that by another spring it will have the largest circulation of any bee-paper on earth. It now stands second, we believe. We think its readers feel it should stand at the head in circulation, as well as in age. It can easily be done, if only each of our present subscribers would send just one new subscriber. Why not do it before Jan. 1st?

Honey-Dew for Winter Stores.—For the second time in more than 25 years, F. Greiner says they have had a big flow of honey-dew in his part of New York, and he seems anxious as to its effects upon wintering. He says in *Gleanings in Bee-Culture*:

"Honey-dew is rather unreliable winter food for bees, to judge from experience. Colonies provisioned with such are not in good condition to be taken into cellars, unless they are taken out several times during the winter and given flights, and then the result might be questionable.

"Should the winter turn out to be a mild one, or should there be a number of warm days or spells at intervals of three or four weeks, everything will probably work well with out-door wintered stock, for I do believe that, aside from the food question, our bees will be in excellent condition. They will start into winter with many young bees, breeding having been kept up to a later date than usual."

The other time they had honey-dew some seven or eight years ago, the following winter was open, giving frequent flights. Bees wintered out-doors came thru in the very best condition. Those in cellar that were put out in February were all right, those brought out later were the worse for the longer confinement. This time he didn't intend to take any chances, and was going to take away what he could of the honey-dew and feed sugar syrup.

Selling Honey.—W. O. Victor, a Texas bee-keeper who has had as many as 600 colonies at one time, and who has sold 50,000 pounds of honey in a single season, says in the *Bee-Keepers' Review* that he thinks the commission man a necessity for the beginner. When his crop first exceeded the local demand, he found the commission man very convenient. In the past 15 years he has sold hundreds of tons of honey, and thinks \$150 would cover his total loss.

In one instance he shipped to a commission firm, and received returns at \$1.00 per case of 12 sections. Seeking the customer who bought the honey, he found it had been sold for \$1.50 per case. Instead of quitting the commission firm he went to them and told them that thereafter he would name the price and they should sell at that or hold the honey subject to his order, and they had since sold hundreds of dollars worth of honey for him.

In another case he shipped 60 buckets of chunk honey to a firm. Calling at the place incognito, he found the buckets market $1\frac{1}{2}$ to 4 pounds more than the actual weight, and an enterprising salesman told him the honey was from California, and only 50 buckets were left out of 500 received the week before! Then Mr. Victor drew from his pocket the letter acknowledging the receipt of the honey. Tableau!

Bees and the Pollenization of Fruits.—In a new periodical, called the *Poultryman and Pomologist*, we find the following item on the pollenization of fruits, giving particular credit to the bees in this important work:

"The pollenization of fruits is a subject to which fruit-growers should give more attention. Last year, on a large

field of strawberry-plants, I grew only buttons, and my loss on the crop was several hundred dollars. During the blossoming period it rained most of the time, so there were only a few days of sunshine when the bees could work in them. There were no bees kept very near the field, and I have reason to believe that the cause of the imperfect pollenization of the blossoms was that there were not enough bees to do the work in the few days that the sun shone when the plants were in blossom. It is evident that twice the number of bees would have fertilized twice the number of blossoms in the same time, and therefore it would have been profitable for me to have had more bees in the field. I made the mistake of depending upon the bees kept by a neighbor living a considerable distance from me, when I should have kept a few hives on my farm. More bees would have been working in the field, more blossoms would have been pollenized, and the result would have been larger berries.

Experiments have shown that if the blossoms of pistillate varieties are covered so that bees or insects cannot get to them, they will bear no fruit. From the experience of a rainy season we learn the importance of having plenty of bees close at hand to do as much as possible when the sun shines. Last year some orchards on farms where there was a large apiary, bore good crops of fruit, and other orchards in the vicinity bore no fruit, which seems to prove that the bees are needed for the orchard as well as for the strawberries.—W. H. JENKINS."

Bee-Journals for Bee-Keepers.—In the Canadian Bee Journal Mr. J. D. Evans gives his ideas as to what a good bee-journal should be. Three specifications:

1. "It should strictly exclude from its columns all reports of big crops; they are seldom true, and always misleading." (Rather tough on the veracity of bee-keepers.)

2. "It should honestly publish failures." (Is the truth to be told when one has a failure, and suppress when one has success?)

3. Reports of conventions "should not be printed in full, but only a synopsis containing the practical points brought out." (But "there are others," Mr. Evans, who consider the *very best* feature of the Canadian Bee Journal its full convention reports.)

Mr. Evans further says: "I know of no journal published entirely in our interests. If the publishers of newspapers are not induced to boom the profession in order to have more customers to whom they may sell supplies, or from whom they may buy cheap honey, the desire for a larger field from which they may secure subscribers produces the same result, but would we be any better if the Canadian Bee Journal came under the control of the Ontario Bee-Keepers' Association? I am afraid not. I doubt whether we could agree as to what should be inserted therein."

In Germany, where a large proportion of the bee-journals are run by bee-keepers' associations, they do not seem to differ from the bee-journals of this country in this regard, unless it be that they do a little more toward urging bee-keeping for all. Whether the climate of Canada differs greatly from that of Germany in this respect may never be certainly known, unless the Ontario association should become the publisher of a bee-journal.

Start the Children in Bee-Keeping.—In the Country Gentleman of recent date we find the following paragraphs written by L. W. Lighty, of Adams Co., Pa., which we particularly wish parents to read:

Parents make a big mistake when they keep their children dependent until they are full grown. Give that 10-year-old boy a pen of pure-bred fowls, and the 13-year-old girl two colonies of pure Italian bees, and buy the products at market price and pay them in cash. Sell them the feed and supplies, and you will be astonished at the business talent they will develop. Nearly always one member of the family will take a delight in the bees, and undertake to manage them.

Many farmers have a pleasant little home at one end

of the farm for their hired man. He generally has a garden and lot, and if the proprietor does not wish to keep bees, it might be quite an incentive to the hired man if he or his family were allowed to make some money from a small number of colonies. The bees would be a benefit to the land-owner, especially if he were growing fruit.

Start with one or two good colonies, but do not have scrubs or cross, malicious hybrids. Good, thoroughbred stock pays just as well in the bee-yard as in the poultry-yard or cow-stable.

We want to emphasize the suggestion that the children be encouraged to "take to bees." Many of them will be wonderfully pleased to have one or more colonies all their own, and manage them alone as far as possible. It will pay to interest the children in a way that will help to keep them in the country, instead of their crowding into the unhealthy cities with their awful competition in all lines of work and business.

Begin this winter to interest the boys and the girls in bees, and when spring comes again, give each a colony of bees, or something else, to manage as their own, and thus let them learn how to plan and carry on business early in life. Of course, they will often need your helpful counsel and wise advice, and you will greatly enjoy giving them all they may require.

We believe fully in the boys and girls, and want to enter a strong plea that they be started in business for themselves while under the care and direction of blessed home influences.

A Record for Extracting is given by Harry Howe in Gleanings in Bee-Culture. He and three others of W. L. Coggshall's hands (one of them Mr. Coggshall's youngest son, weighing 70 pounds) extracted 1,400 pounds in 75 minutes—more than 1,100 pounds an hour. At another time a boy and a man extracted 2,500 pounds in a day. But the best record is 900 pounds an hour for two men.

HON. EUGENE SECOR, of Winnebago Co., Iowa, reported "the first snow of the season" Nov. 30—Thanksgiving day.

"SHORTER SPELLING."—Stenog says in Gleanings in Bee-Culture:

"Dr. Mason favors a shorter spelling, but adds: 'If I were to try this new-fangled way I'm sure I'd make a failure of it.' He calls it 'od.' But that spells *oad*. He means *ahd*!"

That those two men cannot agree as to the spelling of "odd" seems odd. Must be a matter of locality!

MR. G. M. DOOLITTLE, of Onondago Co., N. Y., wrote us as follows Dec. 4:

"I have been badly crippled with rheumatism for the last three or four weeks, so I have not been able to take the intended rest by hunting and tramping. Then a week or 10 days ago I threw my left shoulder out of joint, and have what the doctor calls a 'dislocated shoulder.' He comforts me by saying 'it is nothing serious, but may be quite annoying.' But the annoying part *feels* quite serious at times."

Mr. Doolittle seems to have been somewhat unfortunate with his bones the past year. We believe he broke one or two ribs awhile ago, and now he has been "striking out" too hard, we presume, "over the left," and has to suffer the consequences. It seems to us that a "big, fat boy" like Mr. Doolittle, ought to go slow, and take better care of himself.

BEST WHITE ALFALFA HONEY

In 60-pound Tin Cans.

WE have been able to secure a quantity of WHITE ALFALFA EXTRACTED HONEY which we offer for the present at these prices, on board cars here in Chicago: Sample by mail 10 cents; 2 60-pound cans, in a box, 9½ cents a pound; 4 or more cans, 9 cents a pound. Cash with order in all cases. Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

BUY THE BEST.

If you want the best low-down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad-tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and

ELECTRIC

rear hounds are made from the best angle steel, which is neater, stronger and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4,000 pounds anywhere. Write the Electric Wheel Co., Box 16, Quincy, Ill., for their new catalog, which fully describes this wagon, their famous Electric Wheels, and Electric Feed Cookers. Please mention the Bee Journal.

None Better
Everything new-say to make a good incubator is put into the new
None Better INCUBATOR.

Works made. The most perfectly. Built to last. Lowest priced good machine on the market. Send 2c. stamp for catalogue. Hawkeye Incubator Co., Box A, Newton, Ia.

Glass Honey-Jars!

We have two sizes of clear flint-glass Jars, No. 1 holding a scant pound of honey, with an opal or white top held on with a screw metal band under which is a rubber to prevent leakage. No. 2 is a rather tall flint-glass jar with tin screw-cap, holding ½ pound of honey. Both are excellent for retail honey-packages, and are put up in single gross lots. The prices are per gross, f.o.b. Chicago, for the No. 1 jars, \$5.25; for the No. 2, \$4.25.

We can fill orders promptly for these jars. They give excellent satisfaction, we know, for we have used the same jars for several years.

GEORGE W. YORK & CO.
118 Michigan Street, CHICAGO, ILL.

DON'T TAKE CHANCES!

Buy no incubator and pay for it before giving it a trial. The firm who will not sell on trial have no faith in their machines. We sell the celebrated **PREMIER INCUBATOR ON TRIAL.** Also sole manufacturers of **Simplex**, Catalogue and Poultry Helps, &c.

Columbia Incubator Co., 5 Adams St., Delaware City, Del.

Don't Put Oil Putting Bees in the cellar, says Editor Hutchinson. Leaving the bees out till severe weather, is far from desirable. For several years he has celled his bees about Nov. 20. This year he put eight colonies in a clamp the 2nd of November, and promises to tell how they come out next spring. If they all die, Mr. Hutchinson, it will hardly prove that Nov. 2 is too early, for some very warm weather has been since that date this year, and a long spell of warm weather may be harder on them than freezing weather.

Queen-Traps are strongly commended in Bee-Keepers' Review by W. E. Flower, the man who gave the magic-lantern lecture at the Philadelphia convention. Especially does he think them desirable for that large class of bee-keepers, lawyers, ministers, doctors, merchants and mechanics whose occupations will not permit them to be at home when the bees swarm. With the trap the bee-keeper easily finds the queen of the colony that has swarmed, and he knows *whence she came.* By the use of traps he has not lost a swarm or a queen in ten years.

To Start Bees in Sections in desperate cases, some might like to try the plan given by A. J. Wright, in *Gleanings in Bee-Culture*.

"When you are ready for section work, cage the queen, giving enough 'Good' candy to last two or three days. Put on your super of sections with bait, if convenient. On top of this super place an empty one, in which put the caged queen. The bees will begin work in the sections at once, and will keep at it as long as there is nectar coming in. The empty super and cage should, of course, be removed as soon as the queen is liberated."

Localities Differ as to Pollen.—R. C. Aikin says in the *Progressive Bee-Keeper*:

"Alfalfa yields almost no pollen whatever, and during the honey-flows here there is very little pollen gathered or to be had. To have combs overloaded with pollen is a thing I have never known in my present field. I sometimes think I would have much more rapid breeding in the spring if

BIG MONEY IN POULTRY

If you have the right kind and know how to handle it. The best kind and the best way to make money with them is told in our fully illustrated **Poultry Guide**, in our Mammoth Annual. Tells all about 20 varieties of fowls, and their treatment in health and disease; plans for poultry houses, recipes treating all diseases, etc. Gives lowest prices on stock. Sent for 15c.

John Bauscher, Jr., Box 94, Freeport, Ill.

24E13t Mention the American Bee Journal.

BEE-SUPPLIES
Root's Goods at Root's Prices. **POUDER'S HONEY-JARS** and everything used by bee-keepers. Prompt Service—low freight rate. Catalog free. **WALTER S. POWDER,** 512 Mass. Ave., INDIANAPOLIS, IND.

How Would You Like

to have a farm fence that would turn ALL KINDS of stock? Try ours. Send for Catalogue. **PAGE WOVEN WIRE FENCE CO., ADRIAN, MICH.** Please mention Bee Journal when writing.

Root's Column

Bee-Keeping in Colorado.

The editor of Gleanings in Bee-Culture, Mr. E. R. Root, has just returned from the Denver Bee-Keepers' Convention, and reports that he has secured some 50 views of Colorado scenes, apiaries, homes of the bee-keepers, etc. Many of these will find place on the pages of Gleanings in Bee-Culture during the coming year.

Prize Pictures.

In Gleanings of Dec. 15 we expect to give pictures of the two best-looking editors in all beedom. (Gleanings representatives will not be in it, of course.) Good looking girls will vie with them in good looks, on other pages.

Clubbing Rates.

AS AN inducement for our subscribers to renew before the expiration of their present subscription, which saves us considerable time, we offer the following rates for Gleanings one year and a year's subscription to any of the following papers at prices mentioned.

For One Dollar Only.

Gleanings and your choice of the following:

- | | |
|---------------------------------------|---------------|
| American Agriculturist, with Almanac. | |
| Orange Judd Farmer, with Almanac. | |
| N. E. Homestead, with Almanac. | |
| Northwestern Agriculturist. | |
| American Poultry Journal. | |
| Reliable Poultry Journal. | |
| Agricultural Epitomist. | |
| Farm and Fireside. | |
| Poultry Monthly. | Farm Journal. |
| Poultry Keeper. | Farm Poultry. |

For One Dollar and Ten Cents.

Gleanings and your choice of the following:

- | | |
|-------------------|-----------------|
| Practical Farmer. | Prairie Farmer. |
| Michigan Farmer. | Ohio Farmer. |

For \$1.25—Gleanings and Rural New Yorker.
\$1.30—Gleanings and National Stockman.

For \$1.50—Gleanings and Cosmopolitan or McClure's Magazine or American Garden.

For \$2.00—Gleanings and Country Gentleman.
For \$2.50—Gleanings and Review of Reviews.

New subscribers also are entitled to these rates.

there was more pollen in the hives. I have seen many a colony that did not seem to have an available cell of pollen. I feed much 'chop' to my bees every spring—in Iowa they would not be coaxed to use it. In my location pollen-bearing plants are scarce, pollen in sections is never thought of, and does not occur. The flora is changing, and what applied a few years ago does not now."

Small vs. Large Hives for Comb Honey.—In Gleanings in Bee-Culture D. N. Ritchey, of Licking Co., Ohio, makes a strong plea for small hives. He cites the case of a man who has very large hives, and they swarm and give surplus only once in 5 or 6 years. Only once in 15 years have the large swarms from these hives gathered enough stores to last them thru the winter. In a foot-note the editor says:

"In a word, the size of the brood-chamber depends largely upon the locality, and, secondarily, upon the bee-keeper's peculiar notions. From the mass of evidence that has been produced, I believe large hives are not practical in some localities, in the same way that small ones are not adapted for others. Manufacturers might as well give up the notion that bee-keepers can be driven like a flock of sheep over one road—the road denominated the 8-frame Langstroth hive pure and simple. The proof of the pudding is in the eating; and where large hives give big results in dollars and cents, it is folly to talk small hives; but when the small hives will outstrip the big ones, as seems to be the case in your locality, it is penny wise and pound foolish to discard small for large hives."

Are Robber-Bees Robbers for Life?—The general belief is that when a bee once becomes a robber it never returns to honest ways. Harry Howe, in Gleanings in Bee-Culture, is inclined to discredit this general belief. On his late arrival in Cuba he saw robbers thicker and more aggressive than he had ever seen them at the North. In the hot afternoons, about the only bees to be seen flying were those shiny black fellows—perhaps professional robbers. A walk thru the fields showed but few bees on the blossoms, but of those that were there a good many were those identical "robbers," with their shiny black dress. Pretty strong proof that they were willing to work for a living if they could get a job. He further says:

"Another point I should like the advocates of the 'once a robber always a robber' idea to explain. What becomes of them when a honey-flow commences suddenly, as it often does, from basswood, for instance? One day the robbers may follow one around the apiary by the hundred, pitching into every hive that is opened. In a day or two basswood is out, and one can leave honey any where in the yard, and not a bee will look at it."

The New York Bee-Disease, or the disease now prevailing among the bees of that State, is thus clearly described by the bee-inspector, N. D. West, in Gleanings in Bee-Culture:

"We have, I think, more than one kind of disease on the ground, and yet there seems to be a tracing from what I have called pickled brood, all the way along from bad to worse, and in different stages, until at last it so closely resembles foul brood that it is difficult to draw the line between this and the genuine foul brood, although some of the dead brood will be found at times to be flattened down into the cell, and will be about the color of white glue, and will, when a toothpick is placed in it, draw out from its cell from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch. But you have to hold the toothpick with an object in view, and try to get it to string out or it will not follow the toothpick at all. Some of this becomes coffee-colored, and is rotten in the cell, and will string out some, but it will not break and spring back like rubber; neither do the combs, when held close to the nose, give off that offensive and sickening odor that I get from what I call the old-time foul brood.

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a small quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old, personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it post-paid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

The hive, when opened, or a comb held close to one's nose, will give a kind of sour smell, or odor; but one of these coffee-colored, rotten brood, when removed from the cell and held close to the nose, will have a sort of rotten smell only. But take a hive full of brood, three-fourths of it good brood and one-fourth of it bad brood, as described above, and place it on top of a pretty good swarm to hatch; place a queen-excluding zinc between the hives, and keep the queen below, and in due time the brood above the excluder will all be hatcht out, and all of the bad brood will be cleaned out of the combs, and no more trace of the bad brood is seen in these hives that season. This has been my own experience in my own apiaries this season, and these colonies in the lower hives were slightly affected, as well as the brood placed on top of the colonies."

Conditions Favoring Cure of Foul Brood.

Inspector West, of New York State, is puzzled to know whether the disease that is making so much trouble, resulting already in the destruction of hundreds of colonies, is one disease in various degrees of severity, or several diseases. There is no doubt that foul brood does not in all cases show the same degree of virulence, and the belief has been advanced that where the disease has prevailed for some time the bees acquire a certain degree of immunity. In any case, some remarks that Mr. West makes in Gleanings in Bee-Culture, about the disease that is troubling New Yorkers, seem to apply equally well to foul brood. A strong colony, especially one strong with young bees, makes a better stand against the disease than a weak one. The flow of honey is important. The disease seems, to a certain extent, to ebb and flow with the flow of honey. A good flow of honey seems to lessen the amount of diseased brood, which again becomes more plentiful when the flow is over. There seems to be an advantage in large hives with an extra supply of honey always in sight.

Mr. West says: "I do have some fears that this malady may clean us all out of bees; but I have faith, and hope that, if we reach a good honey season, this dreaded disease may practically disappear."

Editor Root makes out a pretty clear case that the New York disease is not foul brood.

Results of the Past Season.

I commenced the summer of 1899 with 35 colonies in good shape, and one a little on the weak list. We had no frost after April 17, and everything seemed to bloom profusely, but the bees didn't seem to accumulate as they should, so they didn't begin to swarm until July 1, and I didn't get but 4 swarms, making an even 40 colonies. I obtained 987 very well filled sections, or 26 per colony, spring count, which I sold readily at home for 12 1/2 cents per section. They were well filled, many weighing one pound and one or two ounces. I think the whole crop would hold out to one pound to the section. **IRA SHOCKEY,**
Randolph Co., W. Va., Dec. 1.

A Kansas Report.

I send you a photograph of my apiary. You will notice that part of the hives are under a shed, packed for winter. All the hives face the south. I have 22 colonies. I leave the super on with the quilt on top of the brood frames, then a chaff cushion over the quilt. At the back of the hives is a space of one foot packed firmly with fine hay; also packed the same between the hives. On top of the hives I have large

chaff cushions; later on I will put hay on top of the cushions.

My bees did well for this part of the country, considering the season. I sold about 700 pounds of comb honey near home at 12 1/2 cents per pound, leaving a balance of 75 pounds for home use. I used both the tall and the square plain sections with fence separators.

I came to Kansas two years ago from Nebraska, having sold all my bees before leaving. I purchased four colonies here, and increased by natural swarming to 10. Last winter being pretty severe on the bees, I lost five colonies. I now have 22 colonies. A short distance south of my bee-yard is a field of 100 acres of alfalfa; west are 80 acres more. I have also some of the Rocky Mountain bee-plant near, and many fruit-trees set out in the yard, such as cherries, apples, pears, peaches and apricots, and along the west side currant bushes.

I wish to say that if I had not read the American Bee Journal long before I kept bees I do not know that I should have handled or kept them at all.

C. H. PETTENGELL.

Phillips Co., Kans., Nov. 9.

[The photograph of Mr. Pettengell's apiary was received, but it was not clear enough to make a good engraving.—ED.]

Report for the Past Season.

I came thru last winter with 27 colonies, having lost but one; these increased to 35, besides producing over 3 000 pounds of surplus honey.

O. F. BEARDSLEY.

Polk Co., Oreg., Nov. 22.

Buckwheat Helps Him Out.

This has been one of the worst years for bees in Vermont that I ever knew, but buckwheat came to my rescue, and the bees have plenty to winter on, and gave me 3,500 pounds of honey from 144 colonies, spring count.

A. W. DARBY.

Graud Isle Co., Vt., Nov. 24.

Results of the Past Season.

My eight colonies of bees, spring count, increased to 16, and I extracted 250 pounds of honey of a dark color.

I like the Bee Journal and take the time to read all of it.

F. B. WEDEL.

McPherson Co., Kan., Nov. 22.

What About Mesquite?

Will some southwestern subscriber tell us thru the American Bee Journal all about the mesquite as a honey-plant, time of blooming, duration of flow, and amount of honey per colony an apiary will average from it, in an ordinary season?

JOHN LEFLER.

San Bernardino Co., Calif.

Bees Did Little This Year.

Bees did little the past season in this part of the country, and I fear they have gone into winter quarters rather poor.

Polk Co., Tenn., Nov. 23. M. T. FOUTS.

His Colonies Surprised Him.

This is my second year of bee-keeping. Last year I had to feed 3 colonies out of 4. Last spring I started with 4, and one cast a large swarm July 19. I lost the old colony thru a misbred queen, but the 3 colonies surprised me, for I got 90 pounds of white and about 170 pounds of amber honey from them, and 10 to 12 pounds from the new swarm; besides this the brood-chambers were entirely filled.

Rock Co., Wis.

CUAS. LUEBKE.

A Fairly Good Season.

This has been a fairly good year for bee-keepers in Missouri. I had some over 3,000 pounds of honey the past season—

A GOOD WATCH

for only \$3.50

Free for 8 New Subscribers

The watch offered here is a splendid time-keeper, and warranted to give excellent satisfaction. It is an open-face, stem wind and stem set, NEW YORK STANDARD MOVEMENT, in a silverine case with screw front and back, and of good weight, thus making a perfect, dust-proof watch.

We offer this watch, prepaid, for only \$3.50; or we club it with the Bee Journal for one year—both for \$4; or we will send it FREE as a premium for only 8 NEW subscribers to the Bee Journal for a year (with \$8.00). This is indeed a bargain. The watch would make a fine gift.

Page & Lyon Mfg. Co.

NEW LONDON, WIS.,

Operates two Sawmills that cut, annually, eight million feet of lumber, thus securing the best lumber at the lowest price for the manufacture of ... Bee-Keepers' Supplies...

They have also one of the LARGEST FACTORIES and the latest and most improved machinery for the manufacture of Bee-Hives, Sections, &c., that there is in the State. The material is cut from patterns, by machinery, and is absolutely accurate. For Sections, the clearest and whitest Basswood is used, and they are polished on both sides. Nearness to Pine and Basswood forests, and possession of mills and factory equip with best machinery, all combine to enable this firm to furnish the BEST GOODS AT THE LOWEST PRICES.

Send for Circular and see the prices on a full line of Supplies.

Don't fail to mention the Bee Journal when writing advertisers.

mostly white clover—2,000 pounds of comb and the balance extracted. The demand has been good, and so the honey is mostly sold. I have 55 colonies in good condition on the summer stands. I have lost only two colonies in nine years in wintering.

I want to thank you for the American Bee Journal. May it live long to do good.

H. C. MIDDLETON.

DeKalb Co., Mo., Nov. 22.

Another Poor Honey-Year.

This has been another poor year with the bee-keepers in this part of the State, as bees have not accumulated enough to eat since June 3, and the loss in queens has been quite heavy. I lost 17 in swarming-time, and bought only 7. I have 42 colonies, and bought one barrel of sugar weighing 370 pounds, paying \$19.73, and in 10 days three-fourths was carried into the brood-chambers.

J. H. ALLEN.

Nansmond Co., Va., Nov. 29.

A Good Year for Bees.

This was a very good year for bees here. I had 53 colonies, spring count, increase to 60 colonies, and got 1,000 pounds of comb honey and 2,000 pounds of extracted. I sold all of my honey in the home market—comb at 10 and 12½ cents per pound, and extracted, 9 and 10 cents. I will send a photograph of my apple-orchard apiary of 60 colonies, showing about two-thirds of the colonies.

JOHN N. MICHAEL.

Caldwell Co., Mo., Dec. 1.

[Mr. Michael has a very nice apiary, but the photograph was not clear enough to make a good engraving, else we would reproduce it.—EDITOR.]

Poor Year But Fair Crop.

This year has been poor for honey. Some of the bee-keepers got none, but I got 700 pounds of nice comb honey from 15 colonies, spring count, and 5 prime swarms, by what I learned from the Bee Journal.

O. F. ARNOLD.

Chenango Co., N. Y., Dec. 4.

The Bee Journal Suits Him.

I am more than pleased with the American Bee Journal. I cannot do without it, and I can't see how any other bee-keeper can deny himself so much good bee-reading and valuable information, when it is so

cheap—only one dollar. I have 300 colonies of bees. The American Bee Journal is my teacher, and the main cause of my success in bee-keeping.

ISAAC HAYS.

Yakima Co., Wash., Nov. 29.

Has Been Successful.

I have been a bee-keeper for 10 years, starting with two colonies of bees, and now I have 55. I have had splendid success.

WM. DECKER.

Nodaway Co., Mo., Nov. 26.

Too Much Rain for Bees.

I have received but little honey from my bees this year—about 1,000 pounds from 100 colonies, and stores enough for winter. We have had too much rain nearly all spring, summer and fall.

T. H. WAALÉ.

Clarke Co., Wash., Nov. 29.

Bees Hardly Paid this Year.

Bees have hardly paid this year. I have handled bees for the last 30 years, but this has been the poorest year for honey I ever had. I handled this year about 160 colonies of bees, and got about 3,000 pounds of extracted and about 500 of comb honey. I had only four new swarms this year. My bees are all pakt for winter, and have plenty of honey to winter on, altho they are very light in bees, not having bred up in the fall.

W. W. TAYLOR.

Ottawa Co., Ohio, Dec. 4.

His Bees Did Fairly Well.

We are having Florida weather now, and the bees are enjoying it. Yesterday they carried pollen. My bees are in good shape for winter. I have them on the summer stands. We had a short honey harvest last summer, altho I did fairly well. I got 1,000 pounds of comb honey and over 600 pounds of extracted, from 43 colonies, and have it all sold at 15 and 16 cents per pound, in Washington, D. C.

L. A. HAMMOND.

Washington Co., Md., Dec. 4.

The Des Moines Incubator Co.—As an evidence of the universal interest taken in artificial incubation, and the confidence which the whole world places in American-made incubators, we refer to an order recently received by the Des Moines Incubator Co., of Des Moines, Iowa, thru their New York agents, for a shipment of 14 machines to go to parties in Sydney, Australia. Better send to them for their attractive catalog, and see the good things they have to offer. Always mention the American Bee Journal when writing, please.

The Hawkeye Incubator Co., of Newton, Iowa, is one of the younger concerns, full of vim and enterprise, manufacturing incubators. They make very broad claims for their None Better Incubator, claims which we believe the machine and the company can make good. They are making a special claim for simplicity and durability—points which every purchaser will readily appreciate. They send their catalog free. Write them for it, and say you saw their advertisement in the American Bee Journal.

Illinois.—The executive committee of the Illinois State Bee-Keepers' Association have changed the date of the ninth annual meeting to Dec. 26 and 27, 1899. It is understood that all the railroads will make half rates during the holidays. The State Horticultural Society and the State Teachers' Institute hold their annual meetings at the same time, and all at the State House, so that it will be a great inducement for a good attendance. We expect to have a fine program for the occasion, and a good time, as bee-keepers always do when they get together. Come, everybody!

LATER.—Since the insertion of the previous notice the railroads, thru the Western Passenger Association, have refused to make a single fare rate for the round trip, but made the rate of one fare and a third for the round trip. If any one when purchasing a ticket is refused the one-third rate for the round trip, he must demand a certificate showing that he paid full fare coming, and together with the Horticultural Society we expect to have much more than 100 in attendance, and thereby get the above-named rate.

Bradfordton, Ill. JAS. A. STONE, Sec.

Michigan.—The annual meeting of the Michigan State Bee-Keepers' Association will be held at Thompsonville, Benzie Co., Jan. 1 and 2, 1900. There will be reduced rates on all railroads, and a special rate has been secured at all the hotels there at 75 cents per day. There will be an exhibition of the famous willow-herb honey, also of all the leading supplies used in the apiary, and latest improved implements. At least two, and perhaps three, of the A. I. Root family will be present, and other noted men. Everything indicates the largest meeting held in years. The subjects discuss will be those nearest the heart of the bee-keeper, so come prepared to give your views, in exchange for the views of others. It will more than repay you for all the time and expense to attend.

Fremont, Mich. GEO. E. HILTON, Pres.

New York.—The 34th semi-annual meeting of the Seneca County Bee-Keepers' Association will be held in K. O. T. M. Hall, at Romulus, N. Y., on Tuesday, Dec. 19, 1899, at 10 o'clock a.m. Among the subjects, and those to discuss them are these: "Comb vs. Extracted Honey for Profit," J. C. Howard, followed by H. L. Lyke, "Why I Quit the Bee-Business," B. D. Scott, Fred S. Emens, J. F. Hunt and Natt Sutton. Prospects for next season, H. McLellan.

Frank Benton, of Washington, D. C., Assistant Entomologist U. S. Department of Agriculture, will be present and address the meeting at this time, and take part in the discussions.

Romulus, N. Y. C. B. HOWARD, Sec.

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Nov. 24.—There is a firm tone in all kinds of honey, even buckwheat sells easier than of yore. 10c is obtainable for the best white comb which we class as fancy, and 15c for No. 1 grade; stained and off grades of white, 13@14c; amber, 10@12c; and dark to buckwheat, 9@10c. Extracted white clover and basswood, 8@9c; amber, 7@8c; dark, 6@7c. Beeswax, 27c. R. A. BURNETT & Co.

CINCINNATI, Nov. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8½c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth

KANSAS CITY, Nov. 9.—We quote No. 1 white comb, 13½@14c; No. 2, 13@13½c; No. 1 amber, 13@13½c; No. 2, 12@13c. Extracted, white, 7½@8c; amber, 7@7½c; dark, 5½@6c. Beeswax, 26@22c. C. C. CLEMONS & Co.

NEW YORK, Oct. 20.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote: Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7c to 7½c gallon. Beeswax quiet at 26@27c. HILDRETH & SEGELKEN.

CLEVELAND, Dec. 1.—Fancy white, 16@17c; No. 1 white, 15@16c; No. 1 amber, 13@14c; No. 2 amber, 12@13c; buckwheat, 9@10c. White extracted, 8@9c. A. B. WILLIAMS & Co.

SAN FRANCISCO, Nov. 22.—White comb, 11½@12½c; amber, 8@10c. Extracted, white, 7½@8c; light amber, 7@7½c; amber, 5@5½c. Beeswax, 26@27c.

BOSTON, Dec. 8.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

There is very little now to report in the line of our honey market. The retail trade are loath to pay the higher prices and are buying in a very small way, still the demand is fully equal to the supply. BLAKE, SCOTT & LEE.

ALBANY, Nov. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c. MACDONALD & Co. Successors to Chas. McCulloch & Co.

OMAHA, Nov. 18.—The November trade has up to the present not been as good as was expected, and shows a falling off from October. It seems that the somewhat higher prices this fall are affecting the consumptive demand to some extent, still the warm weather yet prevailing in this part of the country may also be partly responsible for it. While trade has been light, prices have been well maintained, nobody being burdened with stock to such an amount as to become oppressive.

Fancy white still going at 14@14½c, and light amber 1 cent less. Extracted, white, 8@8½c. PEYCKE BROS.

DETROIT, Oct. 18.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8½c. Beeswax, 23@24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity. R. A. BURNETT & CO., 33A 2nd 165 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery. C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth, 40A 1st 2146 45 Central Ave., Cincinnati, O.

Wanted! Your HONEY We will buy it, no matter where you are. Address, giving description and price. 34A 1st THOS. C. STANLEY & SON, Fairfield, Ill.

A LITERARY GEM THE MOST ENGAGING BOOK EVER WRITTEN

BY IAN MACLAREN
REV. H. M. WHARTON, D.D.
J. WILLIAM BUEL, Ph.D.

"The Golden Morning"

A BOOK FOR WHICH THE WORLD HAS WAITED

ITS PLACE IS IN EVERY CHRISTIAN HOME

IT WILL BIND THE BIBLE CLOSER TO THE PEOPLE

IT IS SURE TO EXERT A POWERFUL INFLUENCE FOR GOOD

NOTHING LIKE IT EVER BEFORE WRITTEN

NOT TO BE HAD - IN - BOOK STORES

NEWS AND GOSSIP OF A NEW BOOK ON THE BIBLE have been current in book and Christian circles everywhere for some months. In its authorship was to be combined the superb talents and literary abilities of three of the greatest lights in the world of religious literature.

The book is about to appear and on its title page in collaboration as authors are found the names of that most popular of all writers, IAN MACLAREN (Rev. John Watson), together with H. M. WHARTON, D.D., the great Evangelist, and J. WILLIAM BUEL, Ph.D., one of the most prominent and popular writers on Biblical subjects. A MASTERPIECE INDEED must be the book which calls to its creation such a combination of unmatched talents. IT IS A MASTERPIECE—and it is good omen we bring our readers when we tell them that after the most persistent endeavor and the most industrious and earnest negotiations with the Publishers, this paper is one of a syndicate which has secured the entire first edition for distribution among their subscribers, not as a means of winning profits, but to encourage the people to become regular readers, because of the unusual privileges which are offered regular patrons.

The book is entitled "THE GOLDEN MORNING," and while it was intended to be a \$5.00 book, and has everything about it—authorship, illustrations, paper, printing and binding—to warrant that price, we have, after many objections and refusals, made terms whereby WE ARE IN POSITION TO OFFER IT TO OUR READERS AT A GREAT REDUCTION. It contains nearly 800 pages and over 500 superb illustrations. It is printed with clear type on coated paper, and is bound in beautifully illuminated covers, with gold and colored stamping.

IT IS IN REALITY THE BIBLE IN STORY FORM arranged so as to assure a perfect understanding of THE GREATEST OF ALL BOOKS even by little children. All ambiguous and obscure phrases and descriptions have been put into language which makes them clear as noon-day. The historic events have been arranged in their proper order, and the story is made continuous and of absorbing interest throughout. Poetical description so freely used in the Bible, and the many Parables, have all received analysis and now appear as plainly told tales which need no interpreter or explanation.

Hundreds of artistic and accurate pictures have been used to embellish its pages and fix in the mind of reader or student the scenes so graphically described. No book of a religious nature has ever been so sumptuously illustrated. This feature alone costing an enormous sum of money, as every drawing was made especially for this work.

It will be of highest value to the young, as from a few readings, they will get such an understanding of Bible truths and promises from this book, that it would require years for them to gather through Bible reading or study. Indeed, one of the chief claims of "THE GOLDEN MORNING" to universal popularity, is that the children will learn to reverence and love the Bible and to accept its teachings through reading this charmingly written story.

WE ARE READY TO DISTRIBUTE THIS ORNATE BOOK AMONG OUR READERS who should order at once, as our portion of the introductory edition is limited. The prices are as follows, WITH POSTAGE PREPAID:

BOUND IN EXTRA FINE CLOTH, BEAUTIFUL GOLD AND COLORED STAMPING \$2.75
SUPERB HALF MOROCCO, WITH BURNISHED RED EDGES \$3.75

THE BOOK WILL NOT BE ON SALE IN BOOK-STORES, AND SHOULD BE ORDERED FROM THE OFFICE OF THIS PUBLICATION. EACH ORDER WILL BE PLACED ON FILE ON ITS ARRIVAL AND FILLED IN THE ORDER RECEIVED, BECAUSE OF THE EXTREMELY NARROW MARGIN OF PROFIT, CASH WILL BE EXPECTED WITH EACH ORDER. SHOULD THE BOOK BE UNSATISFACTORY WHEN RECEIVED AND EXAMINED, IT MAY BE RETURNED AND THE MONEY WILL BE CHEERFULLY REFUNDED.

A Bee-Fever that Resulted in Two Apiaries.

BY W. H. HEIM.

I FIND apiculture a very pleasant and instructive as well as profitable business in connection with my other duties, as I am employed by a candy manufacturing company. It may seem very strange to get the bee-fever in a candy factory, but it is a fact, and I am going to tell how it happened. June 20, 1894, there came a run-a-way swarm of bees to our candy factory. A large walnut tree is standing in front of the building, on which clustered this swarm of bees. It was about 4 o'clock in the afternoon, and at 5 o'clock the factory whistle blew—not to give an alarm of fire, but simply to quit work. I then got a small box ready, and up the walnut tree I went 35 feet after that swarm of bees, without bee-veil or gloves; and with a pocket-knife I cut off the limb on which the swarm of bees had clustered, put the bees into the box, and took it to my home. The next day out came the swarm, not being satisfied with the small box. I then got a Simplicity hive from a bee-keeper, and successfully hived them.

Then followed what you may call a genuine case of bee-fever, and I am sorry to say that the fever is as bad as ever.

Picture No. 1 shows what is now my

home apiary of 22 colonies in the back of my lot, which is very small—only 50 by 90 feet—yet I think that 30 colonies could be managed on this small space of ground. My apiary is located on the west and north sides; on the south (which is not shown) is my poultry-yard, where I keep several varieties of poultry, as bees and poultry are my pleasure. Here I spend all my leisure time in looking after them.

My home apiary is chiefly managed for rearing queens and producing comb honey. The past season I tried the plain sections, also the 3 $\frac{1}{2}$ x 5 x 1 $\frac{1}{2}$, or the Ideal super, and find a good sale for honey in these sections. My honey crop was very light, as it was a very poor season in this vicinity.

My out-apiary is located about 8 miles from here—on my father's farm. It has 32 colonies, and is managed for both comb and extracted honey. My father, who has been a bee-keeper for about 40 years, is still interested in bee-keeping. I am sorry that he was not working in the apiary when I took this picture. I give him the credit for man-

No. 2—Mr. W. H. Heim's Out-Apiary.

No. 1.—Home Apiary of Mr. W. H. Heim, of Lycoming Co., Pa.

aging it for me. It faces the south, near an apple orchard—a splendid locality to build up a large apiary.

Lycoming Co., Pa.

**No. 1.—The Bee-Hive.
 How to Get the Most Out of It.**

BY "OLD GRIMES."

A BEE-HIVE under the popular understanding of the term, is a box made of boards, the dimensions, size and shape, are according to the fancy, genius or peculiar ideas of the builder. The common box-hive had its day, and tho' there are but few of them

now in use, they are in evidence in some portions of the country.

To get the most out of a hive of whatever construction, it is necessary to select for it good material, and the chief factors are durability, saving in strength in handling, and time in manipulation. In the portion of the country where the writer lives, pine is the best lumber for the purpose, but it seems to me that cedar would be an excellent lumber on account of its lightness, but, whatever lumber is used, that which is light, free from knots, easily worked, and not easy to split or warp, should be selected. Inch lumber should be used, or inch lumber dressed on both sides.

I have seen hives made of one-half inch lumber, but they cannot be durable on account of the small holding-place for the nails; so to get the most out of a hive it should be strongly put together. The dovetailed feature of late years seems to be superseding all other methods of manufacture, and the chief recommendation is strength of corner. That is all very true, but it requires special machinery to manufacture them, and the feature is very good for the manufacturers of supplies, for it throws the trade all upon their special machinery; but a hive quite as good can be made on a common circular saw by halving out the ends of the side-pieces and setting the ends into the rabbet so made, and nailing both ways. A hive made in this way will stand the stress of hard usage and inclement weather quite as well as the dovetailed hive. I have seen quite as many corners of the dovetailed hive warped out of place as I have the halved corner; but then, the dovetailed hive has come to stay, and I am not disposed to find fault with it.

If the outside of the hive is well made, the interior should receive the same attention. I have seen many hives made with very flimsy frames, altho when the comb is built in the frame it has a certain strength, but will hold its shape better when being filled if made strong.

In nailing a hive there is a mistake many times made in being careless in the driving of the nails. Nails should be driven more or less "toeing," for a nail driven in with the grain of the wood will draw out more easily than if put in a little across the grain. Then, a careless driving of the nail will result sometimes in its breaking out at the point, splitting a portion off the board and weakening that portion of the hive. An inexperienced person should not be allowed to nail hives; it is better to pay a little extra and have the work well done.

Then, to get the most out of a hive with comfort and profit to the operator, it should have as few parts as possible. There is a positive loss where a number of parts have to be removed in order to get into the interior of the hive. Some even go so far as to claim the manipulation of hives instead of frames. There may be some advantages in that plan, but it is largely a matter of education, and in accordance with the tastes of the operator.

To get the most out of a bee-hive it should have a well-made telescoping cover, and sitting over at least three inches. It makes but little difference whether the top is gable or flat, provided the roof is not too steep. This cover should telescope not only over the super, but over any portion of the hive.

As to the matter of hand-holes or cleats for the handling of hives, that is a mere matter of taste. Something should be provided, but the simplest and the most out-of-the-way is the hand-hole.

To get the most out of the bottom of the hive it should be elevated a little from the ground, and about as simple and effective a stand as can be made is a half brick edgewise under each corner, and as a preventive of moisture and rot the grass and weeds should be kept down; sprinkling with strong brine is a very good remedy.

To get years of service out of a hive it should be painted. I am aware that in some quarters the contrary is advised, but the parties who advise are so much in the minority that their views are worth but little attention. The experience of a great number for many years is the safest to follow, and that is overwhelmingly in favor of paint. If it is a good thing for the dwelling, and the barn, and the pig-sty, it is as good for the hive. To be sure, a nail now and then in a warped corner of the hive will tide it along, so a nail in a warped clapboard on the house will save paint. From experience I know that a continued nailing of the corners will result in split corners, for an unpainted board falls into the habit of checking more than half-way thru the surface. By all means paint your hives, then you can get something out of the hive in making it please the eye. White paint and a white hive amid the foliage of the grounds is one of the pleasures that will follow many a youth when he leaves the home.

Questions on the Dickel Theory Answered

BY C. THEILMANN.

I HAVE received the following letter from Editor York, with the request that I answer it:

MR. EDITOR:—I would like to ask Mr. Theilmann a question or two about that Dickel Theory. I know nothing about it, and am asking for information.

Does Mr. Theilmann claim that the queen lays but one kind of eggs, and the bees make whatever sex they desire therefrom? If so, how is it they cannot hatch a queen from eggs in drone-comb, or from a drone-laying queen or laying-worker eggs? How does he account for a queen turning drone-layer as some do in old age?

The fact that he thought those eggs he gave to the queenless swarms were all what were called "worker" eggs, because he had worker-comb, does not prove to my mind that they were all fertilized or worker eggs. My bees often rear drones in cells built out from worker foundation, if there is no regular drone-comb in the hives. With me, new swarms often rear drones almost, if not quite, as plentifully as before swarming.

I am asking for information, not trying to "argue," so turn on a little more light, please.
E. S. MILES.
Crawford Co., Iowa.

The experiments made last July are described on pages 500 and 643. Mr. Miles and those who are interested can there find the information asked, and thus save reprinting the main points about the Dickel-Dzierzon Theory, which, with me, is no more theory, but solid facts proven by actual experiments.

Mr. Miles asks if I "claim the queen lays but one kind of eggs, and the bees make whatever sex they desire therefrom? If so, how is it they cannot hatch a queen from eggs in drone-comb, or from drone-laying-worker eggs? How does he account for queens turning drone-layers, as some do in old age"? Then Mr. M. says: "The fact that he thought those eggs he gave to the queenless swarms were all what are commonly called worker-eggs, because he had worker-comb, does not prove that they were all fertilized or worker eggs," etc.

I will answer the last first by saying that the vitality of old queens is exhausted, and some of the eggs do not contain the generating fluid or sperm in sufficient quantity to generate, and therefore are superseded by the workers.

Young drone-laying queens are not fertilized, and therefore lay unfertilized eggs which produce drones only; the same is true of laying-workers, but neither of the two has any generative power—their eggs will produce drones, but such drones will produce nothing. We have a similar case in the mule, which you all know.

I claim that all the higher class of animals have to be mated in order to have, or receive by that, the generating power. Is it not absurd to claim that drone-eggs (so-called) have no sperm, nevertheless the bee is one of the most intelligent animals we have? My experiments prove clearly that bees can make either sex from what are called worker-eggs, laid by a normal queen, and Prof. Dickel's experiments show that he produced workers and queens from what are called drone-eggs, taken from drone-combs. Who can dispute his claims?

What is a normal queen? It is a queen which is perfectly mated, and can perform all the duties ascribed to her with perfect offspring.

Mr. Miles says that his swarms often rear drones almost, if not quite, as plentifully as before swarming. I have experimented with the same thing, but I never saw a swarm yet, of the many hundreds which I have examined, that reared drones from eggs laid the first five or six days after swarming, even with queens three to four years old; and if any bee-keeper did see such I would like to have him report it.

One of the two stock colonies from which the swarms were supplied did not build any drone-comb at all, and the other built a small batch about two weeks after swarming, but the queen did not lay any eggs in it, and it was partly filled with honey. Both queens were from last year's rearing, prolific and apparently perfect.

Wabasha Co., Minn.

[The following article is from a practical bee-keeper and writer on bee-topics from Texas—Mr. L. Stachelhausen.—EDITOR.]

DZIERZON VS. DICKEL.

On page 643 my old friend, Mr. C. Theilmann, tells of some observations and experiments which he thinks can prove that Dzierzon's Theory is not correct, while Mr. Dickel's is. Observations like those described by Mr. Theilmann I made many times, and many years ago, but they do not prove anything against Dzierzon's Theory.

If we look at the photograph on page 644, we will see

that many empty cells are between the capt brood. This is always a sign that something is wrong. Probably the queen that laid the eggs was worn out, and in this condition laid some unimpregnated eggs in worker-cells. Many times we see on a brood-comb a few cells with higher capings containing drone-pupæ. I always note these colonies for changing the queen as soon as possible. Sometimes even young queens will lay some drone-eggs in worker-cells at first, and will get all right afterwards. All this was known long ago, and Herr von Berlepsch mentioned it in his book, second edition, page 98, about 30 years ago. Besides this, laying workers cause many mistakes in this respect, especially in Egyptian and Cyprian colonies we can observe that a fertile queen and laying-workers are in the same hive at the same time. So we see these observations can be explained without difficulty.

About the many experiments Mr. Dickel made and recommended, it must be said that they do not prove anything. Scientific authorities have lately proven that Mr. Dickel's theory is a fallacy and not Mr. Dzierzon's.

Fleischman, professor of zoology at the University of Erlangen, says it is simply impossible that a worker-larva can be changed to a drone—something Mr. Dickel asserts—because drone and worker larvæ can be easily distinguished by microscopic analyses as soon as they leave the eggs. Prof. Blochmann has analyzed, by the aid of modern technic, drone and worker eggs, and proven that, without doubt, the latter is impregnated while the first is not.

Against the scientific proof nothing can be said, and nobody would mention Dickel's theory any more if Mr. Dickel were not the editor of a bee-paper, and does most of the talking himself.

D. STACHELHAUSEN.

Bexar Co., Tex.

[So far as the American Bee Journal is concerned this will close the discussion of the Dickel Theory for the present.—EDITOR.]

Larvæ for Queen-Rearing—For What Age Do the Bees Show a Preference?

BY DR. C. C. MILLER.

ON page 725 of Gleanings in Bee-Culture for 1898 I expressed the belief that the common notion that, when a queen was suddenly removed from a colony, the bees were in such haste to rear a successor that they would select larvæ too old, was a mistaken notion. Earnest protests came from those whose opinions were entitled to respect, and some views were attributed to me that I did not hold. On page 427 of this year I defined my position more explicitly, and on page 494 said: "Please watch what bees do when the queen is taken away, and see if they make the mistake of choosing larvæ more than three days old, for queen-rearing." I made the same request publicly and privately elsewhere. I don't know that any one paid any attention to it, and I don't know that I blame such; for, so far as I know, I stood alone in opposing a view in which all the rest were agreed.

Upon one point in dispute, however, I did not stand entirely alone. I said queenless bees start queen-cells when first made queenless, and continue to start queen-cells for several days. Mr. Hutchinson said his bees started all their cells at nearly the same time, and so nearly of an age that the young queens emerged not more than two days apart. Henry Alley said his experience agreed with mine upon this point.

Having asked others to make fresh observations, it was only fair that I should do so myself. It might be I had not been careful enough in previous observations. So I took the matter in dispute to the bees, and took careful notes of their testimony. The important thing was to know somewhat positively the age of the eggs or larvæ used, and the time at which the queen-cells were started.

To No. 84 I gave successively frames of empty comb, noting the time at which a comb was given as well as the time it was taken away. I was not as successful as I should have liked in getting the queen to lay promptly in the combs given. In one case no eggs were laid in the prescribed comb after 24 hours' waiting. The probability is, that in all cases the eggs were laid in the last rather than the first part of the time in which the queen had the comb. That is, if I gave the comb on one day at noon and took it away the next day at noon, very likely most or all the eggs were laid during the latter half of the 24 hours. The crowd of other work upon me will account for the irregular hours at which the work was done.

Allow me to name the different combs by the first five letters of the alphabet. They were given to and taken from No. 84 as follows:

Comb *a*, given June 28, 10 a.m.; taken June 29, 12 m.

Comb *b*, given June 29, 12 m.; taken June 30, 2 p.m.

Comb *c*, given July 1, 4 p.m.; taken July 3, 10 a.m.

Comb *d*, given July 3, 10 a.m.; taken July 4, 10 a.m.

Comb *e*, given July 4, 10 a.m.; taken July 5, 10 a.m.

Each of these combs, when it was taken from No. 84, was put in an upper story of No. 54 over an excluder. No. 54 was a tolerably strong colony with a laying queen. The combs were merely put in this upper story for safe-keeping, the bees taking good care of the eggs and larvæ.

July 5, at 4 p.m., I took from No. 54 its queen and all its combs of brood except the five combs for experiment.

July 6, at 10:30 a.m., I examined to see if any progress had been made. The colony had now been queenless 18 hours 30 minutes, and I found queen-cells started, but not entirely where I expected.

Comb *a* had no queen-cell, neither were any started on it later. Counting that the egg hatches three days after it is laid, the youngest larva in comb *a* must have been at this time about 3 days 22½ hours old, or 22½ hours too old for a good queen, if the scientists are right in telling us that the worker-larvæ are weaned at three days old.

Comb *b* had two queen-cells started on it. The oldest larva in this comb must have been not more than 3 days 22½ hours old, and the youngest not less than 2 days 20½ hours old.

Comb *c* had eight queen-cells. Two of them had hoods built over them, the rest only showed the cells enlarged and an extra amount of pap. No larva in this comb could have been more than one day 18½ hours old. The youngest were probably not more than 24½ hours old.

On the other combs I found no queen-cells.

I very much regret that nothing more precise can be said about the cells on comb *b*. I cannot prove positively that the two cells started on it may not have contained larvæ 3 days 22½ hours old. To make this possible, however, the queen must have commenced laying in this comb the minute it was put in hive 84, while the probability is that she did not begin laying there for some hours afterwards. Moreover, the cells were started at least some little time before the observation was made, so something must be deducted from their age at starting, on that score. Besides, the fact that four times as many cells were started on comb *c* as on comb *b*, the larvæ in *c* being less than two days old, hardly looks as if they would prefer the oldest larvæ in *b* while at the same time they preferred anything so much younger as the larvæ in *c*. But I must leave others to form their own judgment.

If the bees had asked my advice in the matter they probably would have done somewhat differently. I should have said to them, "So long as a larva is only three days old, it's all right for a queen; and as you're in a hurry for another queen you'd better start all your cells on comb *b*." But they didn't ask my advice.

July 7, 4 p.m. Three more queen-cells on comb *b*. These were started from larvæ 2 days 20½ hours old, or older. No cells were started on comb *b* at any later time.

Comb *c* has 16 cells, two of them being emptied of their contents. No larva in this comb could have been more than three days old at the time of this observation.

No queen-cells on combs *d* and *e*.

July 8, 4 p.m. Comb *c* has another cell, making 15 on it (not counting the two that were emptied).

Comb *d* has its first cell started over a larva that was less than 2 days 6 hours old.

July 10, 11:30 a.m. No additional cells on comb *c*.

Comb *d* three has additional cells, these having been started over larvæ less than 4 days 1½ hours old, and they might have been not more than 30 hours old.

July 11, 8 a.m. Comb *c* has 17 cells. If there is no mistake in previous observations, the two additional cells on this comb must have been built over larvæ at least 4 days 1½ hours old. That would surely be taking too old larvæ when younger were present. There is a bare possibility that these two cells were overlooked before, and were now more easily seen when sealed. But I give it just as I find it in the notes taken more than two months ago.

Comb *d* has six cells, the last two started over larvæ less than 4 days 22 hours old, and possibly not more than 3 days 1½ hours old.

July 12, 9 a.m. Comb *d* has 8 cells, the last two started over larvæ less than 5 days 23 hours old, and possibly not more than 3 days 22 hours old.

Comb *e* has three cells, the first it has had. These cells

were started over larvæ less than 4 days 23 hours old, and possibly not more than 2 days 22 hours old.

July 13, 6 a.m. No additional cells on any but comb c, which has now 6 cells, the last three being started over larvæ less than 5 days 20 hours old, and possibly not more than 3 days 23 hours old.

This closes the testimony of the bees, no cells being started later. In some respects it is not exactly what I desired and intended the bees should give, but they are to blame for that and not I. I know very well that this is only a single case, and that the next case might be different, for "bees never do any thing invariably;" but let us see what conclusions may be reached from the testimony given.

In the first place, it certainly is *not* proven by the testimony given that bees made queenless are in such haste to rear a queen that they at once select larvæ too old for the purpose. Moreover, I have had the matter in mind throught the season, and in every case the cells first started were over larvæ that were very small. If any one has accepted the challenge thrown out by me to prove that bees at once selected too old larvæ, I hope he will report at once.

It is certainly very clear that in this case, at least, the bees did not start all their cells within about 48 hours' time, as Mr. Hutchinson says his do. The first cells were started before July 6, 10:30 a.m. The last cells were started after July 12, 9 a.m. From that it is easily seen that the time from the first to the last cells started was six days lacking 1½ hours. It was that much at least, and it may have been more. Henry Alley's experience agrees in this.

While the bees at first select larvæ sufficiently young for good queens, they afterward use some that are too old, continuing to start cells when larvæ of proper age are no longer present. Editor Hutchinson says his bees build cells that he calls "fool-cells," because they are so insignificant and poor, and he does not know how to account for them. If he will observe with sufficient care, I think he will find that they are nothing more nor less than cells started over too old larvæ, probably after larvæ of proper age were no longer present.

I must not evade the observation that, something more than 5½ days after the removal of the queen, the bees started cells over too old larvæ when younger larvæ were present. I might say that sometimes bees hold eggs without hatching for more than three days (Dzierzon says two weeks), but I will not press that.

Until some one brings forward some proof to the contrary, I feel safe in saying that when bees are made queenless they are *not* in such haste to rear a new queen that they select too old larvæ, and that there is no error in selecting during the first five days of queenlessness. If the combs with the cells be taken within the first five days, and put in the upper story of a colony having a laying queen there will be no too old larvæ in the case. If left with the queenless bees till larvæ of proper age are no longer present, they will build cells over too old larvæ—what Mr. Hutchinson calls "fool-cells." McHenry Co., Ill., Sept 29.

[This discussion started originally from my saying, or from some one else saying, that Doolittle-reared queens were to be preferred, because if the bees were left to themselves they would take larvæ too old; and hence queens reared by Nature's method would not average as well as those reared by the Doolittle plan. While I still believe the statement is correct, yet the main prop to support it has been knocked out.

I am always open to conviction; and when any one produces evidence of this kind right from the hive, I cannot see it is any weakness or lowering of dignity to acknowledge my error. It appears then, that if bees have a choice between old and young larvæ, they will select not those which are three days old, as is generally supposed, but those which are just hatched out, or somewhere about 24 hours old. By the Doolittle method it has been our custom generally to select just-hatched larvæ; and in so doing we have been in exact accord with Nature; for the bees seem to say, if their preference is any gauge, that the one-day limit is the best.

I have read over the experiments very carefully, and if the Doctor conducted them exactly as he says (and we have no reason for doubting his statement), then he has a pretty strong clincher on his opponents. Until I received this communication I was inclined to believe he was worsted in the argument; but, thanks to his persistency (a quality that seems to be very markt in his make-up), he has not only proved himself right, but has given queen-breeders a valuable pointer as to the proper age of larvæ to be preferred for queen-rearing.

But I said that I still believe that the bees left to themselves would not rear for the queen-breeder as good queens as when reared by the Doolittle method. By the latter a decided preference is given by Doolittle and his followers for the rearing of cells under the swarming or supersedure impulse. Under such circumstances, the cells are more lavishly supplied with the royal food than queens reared from the cells made by the bees.

Referring to Mr. Hutchinson's statement that bees build most of their cells within 48 hours' time, my experience says there is a great difference in bees. Holy Lands and Syrians will start 25 to 30 cells within a few hours; and after once being started they seem disinclined to start other cells on succeeding days. Black bees will do most of their cell-starting within 48 hours, and Italians and hybrids, especially the former, will extend the period almost up to the limit of available larvæ that can be *possibly* used for the rearing of queens.

There will be very markt exceptions to the statement above; but when I was doing all the queen-rearing myself I was impressed over and over with the general truth of it.—EDITOR.]—Gleanings in Bee-Culture.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 790.]

Mr. W. L. Coggshall, of New York, then read the following paper on

Out-Apiaries for Extracted Honey.

By mistake this paper was announced as relating to comb honey. As a matter of fact I produce but little comb honey, only part of two apiaries being run for it. My opinion is that to produce comb honey to the best advantage it is necessary to see the bees oftener than I can see my out-apiaries.

My first out-apiary was established in 1878. Now I have 14 ranging from one-half mile to 20 miles from home, the average distance being 10 miles.

This season my help consisted of Harry Howe, when he was not looking after his own bees, Harry Bever, and one man during the extracting season only, with my own two boys, 12 and 15 years old.

My loss was rather heavy last winter, which leaves me about 1,300 colonies in the 14 apiaries. These apiaries are scattered irregularly around, south, east and west of home; my brother with his 600 colonies and several smaller lots occupying the remaining territory.

My apiaries are located with more regard to pasturage from buckwheat than from any other consideration.

My system of operation is to make just as few motions as possible; to do just as little teaming as possible; in short, to have as little friction as possible. Each operation has been studied carefully to see how to do it with the least motions, while the existing conditions of each location have been worked out with equal care to reduce the work to the lowest limit consistent with the best results. Nothing is done for the looks of it, or because others do it that way. Utility not looks, honey not fun, results not theory, is the plan. It takes time to have the hives in straight rows, and the bees gather no more honey in that way. It takes money to have the latest thing in hives and fixtures, and there is nothing but satisfaction to be gotten out of them.

The extracting season is not the time that the work is done that secures the results. That is only the harvest; the time to begin to prepare for a crop is at the last emptying in the fall, when one must see that there are plenty of stores to last until honey comes again. Then careful packing, and all that is implied in the wintering problem, comes in.

The amount of bees and their distance from home com-

pels outdoor wintering. Then the spring work, making increase, keeping down the swarming-fever, all require careful treatment.

The honey crop is gathered first. It is for this work that it is necessary to employ skilled and experienced help. Almost any one can work the extractor; not at record speed, perhaps, but fast enough; while only an experienced man can tell at a glance what to do with a case of swarming-fever, or, in fact, even to recognize the symptoms.

Speaking of help, I have about stopt employing local help. No sooner do such get to be good for something than they start in the bee-business for themselves, and my territory is already badly overstockt, there being about 2,000 colonies of bees in the Fall Creek valley, where my best apiaries are located.

Now as to management: In the spring I usually go around and clean out the hive-entrances and take out dead colonies. The entrances are contracted to one inch at this time; this is usually about the time of the first flight in the spring.

Then about May 1 I go around and put out a little honey from the dead colonies to one side of the apiary. The next visit would be to put out the bees about the last of fruit-bloom. At this time the bur-combs are scraped off the top-bars and enameled cloth put on in place of the carpets.

About ten days later start queen-cells for increase. The nuclei which are made at this time are each supplied with a capt queen-cell. From this time on I visit the bees every 8 or 10 days to give the nuclei brood from strong colonies, until the increase is in good condition for the white honey harvest, which begins with us about July 4, and lasts two weeks.

Buckwheat commences to yield about Aug. 5, and lasts until Sept. 1.

The extracting-combs are then stored in the honey-house and spaced loosely, so that the bees can get in to clean them out.

I begin to pack the bees about Oct. 1. It usually takes two men 10 or 12 days to put up the 1,300 colonies. My bees are all packed in sawdust, and about 700 are in sawdust packing or chaff hives.

Each apiary has a bee-house 12x16 feet, extractor and smoker, store-combs for honey, hives—in fact, everything that is needed in any apiary, even to matches.

W. L. COGGSHALL.

Mr. Selser—I would like to ask Mr. Coggshall if he winters his bees outdoors.

Mr. Coggshall—Always.

Mr. Selser—What do you do when snow is 10 feet high?

Mr. Coggshall—The bees are all right.

Dr. Mason—Does the color of combs have any influence on the color of honey?

Answer by some one—I don't see any difference I have combs that I have used several years for extracting.

Pres. Whitcomb—Doctor, do you wish to establish that wax is soluble in water?

Dr. Mason—I am not trying to establish anything; I am trying to learn something. I have been so convinced the past season that the color of the comb does have something to do with the color of honey, that I think I shall use only such combs in the future for producing extracted honey as have not had brood reared in them.

Pres. Whitcomb—Mr. Coggshall, how do you clean out the combs after you get thru extracting?

Mr. Coggshall—Let the bees do the cleaning. I generally come away. [Laughter.]

Pres. Whitcomb—Is it not a better time to go visiting than to receive visitors?

Mr. Hershiser—I understand that you lost bees last winter. Last winter I had bees under snow-drifts. In another place I had 50 colonies. My experience is that snow-drifts, if too deep, are destructive.

Mr. Coggshall—They cannot get a cleansing flight when covered with snow.

Mr. Hershiser—There is a difference in colonies. I had some in Chautauqua hives, and I packed them in sawdust, packed them in so I knew they would winter, but they didn't.

D. H. Coggshall—I had colonies in two-story hives, one below and one above. Those were what I lost. The others went thru all right.

J. H. M. Cook—In small hives will there not be some nuclei?

Dr. Mason—Not necessarily.

Mr. Cook—How late will bees lay in the fall?

Mr. Coggshall—They are laying now. [Sept. 7.]

Mr. Cook—But how late will they lay?

Mr. Coggshall—After September.

Dr. Mason—We have got into this matter of wintering. Last winter my bees were well supplied with what I thought was a poor grade of honey-dew, and I was afraid of heavy loss in wintering, but I never had better success.

Mr. Coggshall—Did they have cleansing flights?

Dr. Mason—No; they wintered in the cellar.

D. H. Coggshall—I had old combs. One man who worked for me thinks just as Dr. Mason does, that old combs color honey, but I never saw any trouble.

Dr. Mason—My experience is that where honey is extracted from combs where brood has been reared several or many times, the honey will be slightly colored.

A sample of honey was shown by Dr. Mason.

Mr. Stone—I had an experience that proved to my satisfaction that dust will discolor honey.

Dr. Mason—Our dust is light-colored.

Mr. Stone—Can you tell by the color about honey-dew?

Dr. Mason—No; for sometimes honey-dew is of a light color and of rather pleasant flavor; at other times it has a very dark color, and of such bad flavor that no one can eat it.

HONEY FROM SWEET CLOVER.

Some extracted sweet clover honey was on exhibition by Dr. Mason, and Pres. Whitcomb said, "I would like to wager my reputation as a bee-keeper that that honey is 40 percent white clover."

Dr. Mason—I won't bet with you for so small a wager. That sample is almost pure sweet clover honey.

Mr. Abbott—There is not any clear sweet clover honey gathered in Nebraska, and that is why Mr. Whitcomb has never seen it.

Dr. Mason—I have sweet clover honey at home that is just as clear and nice as any honey can be, and I have another like this sample that is a little colored by a mixture of dark honey.

Mr. Selser—I would like to substantiate the president's statement that there is 40 percent of something else in that honey. I have tasted the honey. I have written an article and sent it to the bee-papers about it, and that was the last I have heard of it. I think sweet clover is a curse. I have written to all the farmers and told them to root it up.

Mr. Abbott—Why is it a curse?

Mr. Selser—Because the honey is enough to make a dog sick.

Mr. Abbott—You mean it makes *you* sick.

Dr. Mason—I don't care what Mr. Selser thinks, any more than he cares what I think. I *know* that sweet clover honey is a first-class honey, if properly ripened. I am a judge of sweet clover honey; my bees are within reach of acres and acres of sweet clover, and I get more honey from it than from all other sources put together, but enough dark honey is sometimes gathered at the same time to color it. I know enough about sweet clover to know it is *not* a curse, either for honey or by the roadside. It is a blessing to the farmer.

Mr. Abbott—I can go to any market in the United States and get as much for sweet clover honey as for any kind.

Mr. Selser—Not in Philadelphia.

Mr. Abbott—Yes, sir, in Philadelphia and New York. The trouble with me is that I don't get enough of it.

Dr. Mason—Just a few days ago a lady friend was at our house to dinner. We hardly ever put comb honey on the table, but seldom have a meal without having extracted honey, but that day we had a section of pure sweet clover honey on the table, and she said it was as nice honey as she had ever eaten, and we all said it was nice.

Mr. Selser—What I said was a little strong, for I wanted to get up a discussion; but to me it is "off." It is a delicate grade of honey. There is a class of people that cannot eat anything strong, and they will throw it back again. If there is any strong taste they will throw it back to me. Sweet clover has been a curse to me, and I have tried to have it pulled up.

Dr. Mason—Were you speaking of extracted honey or comb honey?

Mr. Selser—Extracted.

Dr. Mason—It probably was not ripe, and when un-ripened it has a strange, green, unpleasant flavor, and that is probably the kind Mr. Selser has been getting, and when in that condition it is not fit to eat.

The convention then adjourned until 7:30 p.m.

Concluded next week.

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

STOP EXTRACTING UNCAPT HONEY.

No doubt there is *some* uncap honey that is sound and will keep—and certainly there is *some* cap honey that will ferment and spoil—but not enough in volume of either kind that it ought to prevent a pretty strict enforcement of the general rules. The man who says some unsealed honey is ripe is simply pushing a special plea to excuse himself in doing wrong. Some farmers are willing to have their hickory-nuts taken without asking. Some ladies do not object to having tobacco-smoke drifted in their faces. Some individuals will not take a contagious disease, no matter how carelessly the germs are scattered around. The point is, that decent and well-meaning people do not act upon these exceptional cases, but upon the general rules. And the general rule is (and this general is a senior Major General, too) that uncap honey is not fit to put on the market. Immense damage is done the honey market, and great wrong is done the honest producer, by those who cheaply produce tons of half-ripened stuff not fit to be sold at all. They want the price set by the man who put in the work necessary to produce a good article, and then they want to float their article off without putting in the work. By the way, is there any one who will *knowingly* buy a barrel of this unripe stuff *except the man who intends to mix two-thirds glucose with it*, and so make it keep? The convention, as reported on page 709, did something in the way of rebuking this evil, but they were not half hot enough.

GETTING THE AMOUNT OF WINTER STORES.

Mr. Doolittle, in his excellent wintering article, page 709, gets after one plan with a sharp stick, which rather seems to me to be good enough—the plan, not the stick—no, plan good enough, and stick too good. This refers to the plan of weighing each hive in the gross, first knowing what the weight of empty hive, combs and bees ought to be. Is there much more danger of figuring wrongly by this plan than there is of guessing too large by the plan which he recommends? Anent the matter of how much winter stores is really on hand, I think a great lot of bee-folks say, "My bees have 20 pounds" (or more) when really they have only 14. In fact, an 8-frame brood-nest containing 14 pounds of actual honey looks pretty well filled. Frames in the brood-chamber don't hold like those in the super; and empty combs from the super don't weigh like those from the brood-chamber.

DROWNING WAX-WORMS IN COMBS.

Wax-worms, when they get big, are very hard to kill by the ordinary method. For a small number of combs I judge that Mr. Glasspole's method, given on page 714, would be excellent. Drown them—drown them thoroly, till they are dead, dead, dead. Then throw out the water with the extractor, and dry the combs in warm air. Who knows how long combs can be kept full of water without damage, as a preventive against eggs hatching?

THAT CELLULOID VEIL.

Rambler's celluloid veil (page 715)—well, I opine it will have quite a tussle of it to get general recognition and currency. Nevertheless, perhaps it may have a legitimate place.

SEXTUPLETS—A "NO NONSENSE" APIARY.

Do they have sextuplets in place of twins in old Clearfield County? Looks like it in that apiary picture on page 721. Perhaps the arrangement and a slight lack of clearness in the half-tone is responsible for that impression. And the apiary? Why, that seems to be the ordinary apiary of the "no nonsense" sort—unless you call comfortable shade for the heated bee-man to work in, a variety of "nonsense."

SOME ENDURING POETRY.

Almost afraid I shall not do justice to Mr. Secor's poem, page 722. It is a good one. As a poet he knows unusually well how to avoid the two opposite evils of too much dignity

and too little dignity in a paper of this kind. (Coals of fire on his head, for putting us critics among the humbugs.) And some of his couplets have a force and inclination to stick which seem to speak of permanence—*c. g.*:

"With a silvery tongue which for smoothness
Beats lightning and tallow combined."

Or this one—

"Would you get the most eggs from a turkey,
Just humor her whims, in the main."

BAD BUSINESS GROUNDWORK—PORTO RICAN HONEY.

What a sad sentence is that of W. A. Selser, on page 724: "Misrepresentation and falsehood are the groundwork upon which a large percentage of salesmen try to build up their business." And the pity of it is that no man can deny it. If it were only untrue how pleasant it would be for a critic to cuff his ears.

Mr. Selser gives a portentous fact where he tells us that Porto Rico is already shipping us honey, and that the bakers have already found out that it decidedly excels all American extracted in power to keep a cake moist. Now I have a sneaking suspicion that all there is to that alleged fact is that the Porto Rican producer *cannot* (owing to the tropical climate) extract his honey unripe, and get it to the United States market without having it spoil on his hands. If that's it, it may be decidedly a blessing in disguise to us to have some of our heavy fellows rudely kicked out of their bad habits by competition from our new island.

THAT NEW "NEW YORK BEE-DISEASE."

And so it is the *New York* bee-disease that we are to make room for next. Can hardly say, "Thanks," or even "Thanks awfully." The genesis of new diseases, affecting man and beast and plant and insect, is one of the wonderful things of this wonderful universe we live in. These troublesome novelties seem to come around very much more frequently than they used to. It is even soberly suggested that germs come to us as dust from the planetary spaces which develop on reaching earth, and go into business each according to his kind. On the whole, I'd sooner lay it to the *transportation* of germs from one part of the world to another—said transportation stirring up variation, and variation enabling them to take a new habitat, and open up a new business—to-wit, a new disease. Dr. Howard is good authority; and if he says the new nephitis the York-Staters have under the floor of their back shed is not pickled-brood, probably it's so. Page 732.

SOMETHING FOR QUEEN-BREEDERS.

An enormous bug in the ear, W. C. Gathright proceeds to give the queen-breeders, page 731. I'm not a queen-breeder, and not qualified to pronounce judgment, but if it is true that bees always remove all the royal jelly given to selected larvae, the professionals ought to have found it out long ago. If the bees do this they most likely do it *roughly*, doing the tender queen-elect no particular good in the process.

CHEAP GERMAN BEES AND QUEENS.

Those mentioned on page 730 are not so very far away from what we would be willing to duplicate, after all. The time of the year, and the hit-or-miss kind of stock that they are, are facts to be considered. Fall swarms, such as would require three united to be first-class for wintering, are not so very cheap at 63 cents (no combs or stores probably), and the two extra queens, which we usually waste, can be found and caged for 25 cents each.

CARLOAD OF HONEY AT 27 CENTS A POUND.

A carload of honey sold in Chicago for 27 cents a pound wholesale! Suited to make a fellow feel like Virgil's hungry wolf listening to the bleat of lambs. And it was only a matter of 20 years ago. Page 726.

WHY DIFFERENCE IN GOOD COLONIES?

Dr. Miller, having but one question to answer, page 727, gives us an excellent and pretty exhaustive view of the reasons why one colony gives surplus and another none—to the puzzlement of the beginner. In my apiary I pretty nearly always assume that a swarm escaped when I didn't see them, if a colony fails to store when other similar ones give surplus.

RAINY OCTOBER IN CALIFORNIA.

Perhaps my nose for superlatives is longer than it ought to be—at any rate I see with interest that California has just had the rainiest October of its history. Not very common to have *any* rain in October, I take it. Page 729.

CONDUCTED BY
DR. C. C. MILLER, Marengo, Ill.

White Coating on Comb Honey.

I have been keeping bees for two years, and have lots to learn yet. I notice now that my comb honey has a white coating on the surface, that is, on the capping. Is it mold or anything that would be injurious to the health of one eating it?
PENNSYLVANIA.

ANSWER.—I'm in the same boat with you in having lots to learn yet, and I suspect we'll keep company for some years to come. But I've learned not to have any fear of that whitish substance that comes upon the surface of comb honey. It looks a little like mold, and possibly is somewhat in that line, but it doesn't seem to affect the taste, and I never knew it to hurt the honey for the use of either man or bee.

Management of Swarms.

I practice natural swarming, hiving the swarm back on the old stand, moving the parent colony to a new location, and sometimes give the swarm part of the brood from the parent colony, sometimes not. The reason for giving part of the brood is to keep the colony strong until they have time to rear field-workers. Do you think giving part of the brood is a good plan? What age brood, and how much, would you use?
KANSAS.

ANSWER.—Now look here, don't you think it's a little rough in you to ask me how a thing will turn out in which you have had direct experience yourself? Instead of your asking me, I ought to ask you about it, for you've had more experience than I in that line. Practice is better than theory, and my opinion would be largely theoretical. But if you'll promise to tell how you come out, I'll agree to do my best at theorizing. You promise, do you? All right, then here's what I think:

In this region, and in any region where the bulk of the surplus is gained in a comparatively short time somewhat early in the season, a colony that will be content to store honey without ever thinking of swarming at all is the one that gives the best yields. Swarming divides the forces, and that is just the thing we don't want. When a colony swarms, if you give it back all its brood, that will leave it stronger for the future than if you give it no brood. But if you give back its brood it will keep on swarming, so that will not do. The question is, how much can you give back without having it swarm? Perhaps you can tell something about that from your past experience. Try two or three frames, and if they don't offer to swarm you can try more with the next swarm. Take off queen-cells from the frames you give. The older the brood the sooner the help gained, so it will be well to give combs consisting as much as possible of sealed brood. In actual practice this may not turn out to be as good as it looks on paper, so watch closely and report results.

About Wintering Bees.

I have had bees for 4 years, and have not been successful with them. When I examine them in the spring, the comb is moldy at the bottom, and has lots of dead bees. It takes them till about July 1 to recruit up again. I put into winter quarters last fall 29 colonies, and came out with 28 in the spring, and there were so few bees that they dwindled down to almost nothing in the spring, which caused me to double up all I could, and left me, with the increase, only 26 colonies at this time, and they are good and strong, with plenty of stores.

I go a good deal by the bee-books and bee-papers, and my own judgment, according to my locality. I wintered them last winter against a hillside, in a shed three sides

under the ground. The south side was a double wall with dirt between the walls, and about a foot apart. I kept an oil stove in it the coldest spells, and aimed to keep it at about 45 degrees. My hive bottom-boards were on tight, with the entrance space wide open. My hives are the improved Langstroth with loose bottoms, with an inch block under each corner.

I have changed my house so it is good and dry, and can not freeze, with an underground spout 36 feet long and 6 inches square, with a couple of elbows and a 6-inch pipe overhead, and 18 inches of fine, dry manure mixt with a little dry earth. If I don't have success in wintering this time, I will have to give up, which I don't like to do, as I have many fixtures, and would like to try to make a success of bee-keeping, as I am the only man this side of Fargo that has bees, that I know of now. NORTH DAKOTA.

ANSWER.—Unless there is a chimney of some kind directly over the blaze to carry off the smoke and foul gases, an oil-stove should never be allowed in a place where bees are confined. The impurities contaminating the air may be worse than the cold.

With good stores in a dry place at about 45 degrees, there ought to be no such trouble as you mention, unless the entrances of the hives become clogged, or unless the fumes of the oil-stove make trouble. With an inch block under each corner it seems there ought to be no trouble about clogging, still it may be well to keep the matter in mind and make sure that there is abundant space for the air to get into the hive. One place, however, you say the bottoms were on tight, and it is quite possible the entrances were clogged.

Extractors and Extracting-Frames.

1. Does the Cowan extractor take combs of different sizes?
2. Would you advise using the full-depth Langstroth frames, or the shallow extracting-frames, for extracting?
3. Should the shallow extracting-frame be wired?

SOUTH CAROLINA.

ANSWERS.—1. The Cowan extractor is made with pockets of different sizes: for Langstroth frames, comb-pockets 9 $\frac{3}{8}$ inches; another with pockets for frames not more than 11 inches deep; and another for larger frames. Of course, any of these would take frames of smaller size.

2. The Dadants and others who produce extracted honey in large quantities think it desirable to have shallow frames for extracting. Other advantages more than balance the advantage the larger frames have in being used sometimes in the brood-chamber.

3. They are stronger when wired; an especial advantage while new.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the new bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

GEORGE W. YORK, Editor.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY,

United States Bee-Keepers' Association.

Organized to advance the pursuit of Apiculture; to promote the interests of bee-keepers; to protect its members; to prevent the adulteration of honey; and to prosecute the dishonest honey-commission men.

Membership Fee—\$1.00 per Annum.

EXECUTIVE COMMITTEE—Pres., E. Whitcomb; Vice-Pres., C. A. Hatch; Secretary, Dr. A. B. Mason, Station B, Toledo, Ohio.

BOARD OF DIRECTORS—E. R. Root; E. Whitcomb; E. T. Abbott; C. P. Dadant; W. Z. Hutchinson; Dr. C. C. Miller.

GEN'L MANAGER AND TREASURER—Eugene Secor, Forest City, Iowa.

VOL. 39. DECEMBER 21, 1899. NO. 51.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "q" or "ed" final to "i" when so pronounced, except when the "e" affects a preceding sound.

The Merriest Christmas of your life we wish to each and every one of our readers—and many returns of the merry day to all.

"Old Grimes is dead." So said the old poem, but by referring to page 801 it will be seen that another "Old Grimes" has taken his place. Probably the latter is a son or grandson of the former. But no matter, the present "Old Grimes" is a bee-keeper, and a good one, too. He proposes to tell in ten or more articles "How to Get the Best Out of"—the hive, a colony of bees, an apiary, a smoker, a honey-house, a honey-extractor, a honey-knife, a queen-excluding honey-board, and our helpers.

Possibly there may be more than the ten articles. There are two on "How to Get the Most Out of an Apiary." This series of articles will be worth many times a single year's subscription to the American Bee Journal. The first one of the series, which appears this week, will be followed by the others in regular weekly succession. Don't fail to read them carefully.

Comb Honey in Cold Weather is the heading of a timely item in *Gleanings in Bee-Culture*, which reads as follows:

"Be sure to warn the groceryman, or any one else who handles your honey, to keep that in the comb, at least, in warm, dry rooms. A room subject to freezing temperature should never be used for the storage of comb honey. Freezing cracks the cappings, and when the room warms up again it will sweat like a pitcher of cold water on a summer's day. Unsealed comb honey receiving such treatment

will also be ruined. The 'sweat' will mingle with the honey, thinning it so it will sour. The commission man is supposed to know all this, while your local grocer may be utterly ignorant of it."

As we read the above paragraph we were reminded that several years ago one of our local grocers, in the summer-time, told us that the comb honey he had was leaking, or the honey was running out of the comb, terribly. When we askt him where he kept it, he replied, "In the refrigerator, of course, for it would melt if outside, these warm days."

How ignorant grocers are about the goods they handle. And yet, we can hardly blame them much for not knowing better concerning honey. They need to be *told* many things, and will always receive it kindly, when it is done in the right way. Of course, the grocer referred to above never will put honey into a refrigerator again. He knows better now.

Australian Honey-Yields.—The Australasian Bee-Keeper reports that in 1898 Frank Curr's bees began storing in August, and continued seven months until March, 1899 (remember that their summer is at the same time as our winter). He started with 120 colonies, increased to 145, and took 47,000 pounds of honey—nearly 400 pounds per colony.

How Many Hours a Day Do Bees Work?—Perhaps a goodly number would answer, that in a busy season a bee works about 24 hours a day. If Prof. C. F. Hodge has made no mistake in his observations, reported in *Gleanings in Bee-Culture*, bees—at least some of them—don't even work on the eight-hour system. He markt bees with colors, watcht them from daylight to dark, and says, "No single bee that I watcht ever workt more than 3½ hours a day." In one case he saw a worker crawl into a cell and watcht her remain there lying quietly on her back for nearly five hours, and asks whether she was asleep or resting.

The Honey-Bee in American History.—The earliest mention of honey in America, so far as considerable research discloses to the writer, is in Irving's account of De-Soto's wanderings. While the adventurer was at the village of Ichicha, in June, 1540, his men found a quantity of bears' grease preserved in pods, likewise oil made from the walnut, and a pot of honey. The latter they had not before seen, nor did they ever again meet with it during their wanderings.

Some have inferred from this that the honey-bee was in Florida at this period, and that it was indigenous to America. But this does not follow; first, because the village in which the honey was found was located in the country since known as northern Georgia, or perhaps northern Alabama, and not in Florida; second, the honey mentioned was very possibly the product of the bumble-bee, which was a native, and very widely scattered.

Nevertheless, the honey-bee was probably introduced by the Spanish settlers in Florida at least at a later period, says the Scientific American, for Bartram, who explored the country in 1773, mentions honey and beeswax as articles of barter among the Indians. He speaks of honey in so many places in his book that it must have been quite common, and therefore could not have been the product of the bumble-bee, whose store of honey is very scant. Bartram was told by a physician that there were few or no bees west of the peninsula of Florida, and but one hive in Mobile, which latter had been brought from Europe. Traders had also informed him that there were none in west Florida.

At this period the honey-bee was common all along the eastern shore of the country, from Nova Scotia southward.

The fact that it was not found in the interior is good evidence that the insect was not a native of America. Otherwise, natural swarming would have distributed it thruout the land long before the arrival of the white man.

Jonathan Carver, an Englishman, explored Wisconsin and the adjacent territory in 1766-67, and in his book published soon after he mentions the common insects. The honey-bee is not among them, but the bumble-bee is referred to as follows: "The bees of America principally lodge their honey in the earth, to secure it from the ravages of the bears, who are remarkably fond of it."

The honey-bee was first noticed by white men in Kentucky in 1780, in New York in 1793, and west of the Mississippi in 1787.

Again the "Sting-Trowel Theory."—Mr. J. J. Ochsen, of Sauk Co., Wis., when renewing his subscription for 1900, enclosed the following which he clipped from the October number of the Normal Instructor—a teacher's paper published in the State of New York:

THE STING IS USEFUL.

What seems to us only harmful and disagreeable may sometimes prove to have uses of which we know nothing.

It will be a surprise to many to learn that, after all, the most important function of the bee's sting is not its stinging. I have long been convinced that the bees put the finishing touches on their cell-work by the dextrous use of their stings; and during this final finishing stage of the process of honey-making the bees inject a minute portion of formic acid into the honey. This is in reality the poison of their sting. This formic acid gives to the honey its peculiar flavor, and also imparts to it its keeping qualities. The sting is really an exquisitely-contrived little trowel, with which the bee finishes off and caps the cells when they are filled brimful with honey. While doing this the formic acid passes from the poison-bag, exudes, drop by drop, from the point of the sting, and the beautiful work is finished.

May it not be, perhaps, that one of the purposes of life's stings is to give a greater zest and flavor to its honey?

Altho no quotation marks appear in the clipping as it appears in the Normal Instructor, those who are familiar with the literature of a few years ago will recognize the second and larger paragraph as something very like the words of the Rev. W. F. Clarke. Probably no wilder theory as to bees was ever imagined, nor one with less foundation. The only reason for the belief of Mr. Clarke that the sting of the bee was used as a trowel, and that poison was dropt from the bee's sting into the honey, was the one given in the clipping, "I have long been convinced." What convinced him he never divulged. Many a bee-keeper has watcht bees working wax, but no one has ever said he saw the sting used for that purpose. No one ever said he saw poison drop from the sting into the honey. Mr. Clarke never said he had seen such a thing; he only said he was "convinced." It would be to his credit if he should now say he had no foundation for his conviction, seeing that the sting-trowel theory seems again coming to light.

Naptha Beta and Napthaline for Foul Brood.—On page 786 appeared a reply to the following from Mr. Dudley. We should also have published at the same time the opinions of Thos. Wm. Cowan, editor of the British Bee Journal, and Hon. R. L. Taylor, both of whom were kind enough to respond to our request, but their replies were overlooked and found too late to appear with Prof. Cook's. Here is Mr. Dudley's question:

EDITOR YORK:—I am very much interested in all you can publish in regard to naphtha beta and naphthaline. Do you think if naphthaline were put into hives of healthy colonies in early spring, and kept there during the robbing season, that the germs of foul brood that would be brought from other infected hives would be kept from spreading in the healthy colonies until the bee-keeper would discover it, and have an opportunity to cure it while strong in bees?

If this drug will retard the disease so that it can be discovered and

treated while a colony is strong, I can see how it can be of much service to those who produce honey in foul-brood localities.

Salt Lake Co., Utah. GEO. E. DUDLEY.

ANSWER.—During the time that naphthaline is in a hive the vapor given off, while not killing the bacilli, arrests their increase of growth; therefore, as suggested, it would prevent the infection from spreading in healthy colonies. It is, however, safer to have a couple of balls of naphthaline split in halves in the hives at all times.

Monterey Co., Calif.,

THOS. WM. COWAN.

ANSWER.—I have never tried the drugs mentioned above, but from considerable experience with the use of salicylic and carbolic acids I should not rely on the plan proposed. Syrup medicated with salicylic acid fed to the bees of any infected colony will prevent the spread of the disease (not cure it) in that colony, as well as to healthy colonies from diseased ones so fed. Possibly the drugs mentioned might do so, too, but as I have tried the other I should prefer that if I were in a case where I wish to prevent the development of the disease for the time being at every cost, feeding during "the robbing season." But the development of the disease is not usually so rapid that one who is acquainted with its characteristics will not discover it before the colony becomes weak, if he is on the lookout for it, going thru each colony three or four times during the season.

Lapeer Co., Mich.

R. L. TAYLOR.

MR. CHAS. DADANT, writing us Dec. 12, reported the illness of his son C. P., who was suffering with bronchitis. We hope he is all right again now.

THE CANADIAN BEE JOURNAL FOR DECEMBER is a pictorial number, containing 16 pictures of leading Canadian bee-keepers, chiefly officers and directors of the Ontario Bee-Keepers' Association. It is very pleasant to look upon the faces of those whose names are familiar to all who read the Canadian Bee Journal.

MR. T. F. BINGHAM, of Clare Co., Mich., wrote us as follows, Dec. 13:

"Everything looks well for a great honey-year. Today is almost the only freezing daylight we have had. My bees don't know that the wind blew yesterday, or that the air is freezing. No snow."

MR. S. A. NIVER—the New York State bee-keeper and honey-salesman who it was said had a tongue that workt on a central pivot—dropt in very unexpectedly to see us one day last week. He's a "jolly boy," even if he has a daughter somewhere near a quarter of a century of age. By the way, the daughter is to be wedded this very week, we believe. (Congratulations all around.) Mr. Niver lived in Chicago the five years just preceding 1890.

ERNEST WYNNE BOYDEN is the name of the latest arrival among the A. I. Root Co. Master Ernest Wynne was born to Mr. and Mrs. A. L. Boyden, Nov. 2, 1899. Editor Hutchinson, when announcing the event, said:

"Mr. Boyden is the Michigan young man who went down to Medina a few years ago, became one of the business managers for the A. I. Root Co., won the heart and hand of Constance Root, or 'Blue Eyes,' as Mr. Root used to call her, has since become one of the partners in the company—and now has a boy, as well as the rest of them."

We extend our congratulations to Mr. and Mrs. Boyden, as well as to all the rest of the "Rootvillians," upon the arrival of "Ernest No. 2." May he emulate the "E(a)rnestness" and other virtues of his honored uncle.

The Premiums offered on page 814 are well worth working for. Look at them.

"Poultry Raising on the Farm"

"Poultry and Incubators on the Farm," "Feeding Specially for Bees," "Raising Broilers for Market," "Success in Egg Farming," "Apions for Profit," "The Pekin Duck Industry," &c., are a few of the many good things contained in our

20TH CENTURY POULTRY BOOK.

It is undeniably the best work of its character ever published. Among other things it treats of the latest improvements in the world famous Reliable Incubators and Brooders which are used all over the United States and in 51 foreign countries. Sent anywhere on receipt of 10c for postage. Reliable Incub. & Brooder Co., Box 12 Quincy, Ill.

Queen - Cells Between Sealed Brood are better cared for than between two combs of unsealed brood, and more bees are found clustered over sealed than unsealed brood.—Bee-Keepers' Review.

Doolittle's Division - Board Feeder is enthusiastically endorsed for stimulative feeding by the two leading bee-keepers where Gleanings in Bee-Culture is manufactured. Simple to use, gets the heat of the cluster so that bees will use it any time, and its use does not start robbing.

Losing Queens in Supers.—Wm. Muth-Rasmussen, in Gleanings in Bee-Culture, says that altho he finds no brood in his sections it is not uncommon to find a queen in the supers. As a result, when a super is taken from a hive there is danger that a queen may be lost. So when he removes a super he tacks on it a piece of section with the number of the colony on it. If he finds a queen in the super, the number tells him where to return the queen.

Golden and Five-Banded Bees.—G. M. Doolittle says in Gleanings in Bee-Culture that some of the very yellow bees in this country are of Cyprian origin, but nearly all the very yellow bees of Italian blood came originally from Joseph M. Brooks, of Indiana. By some the word "golden" is applied to bees a little yellower than the five-banded, but the two terms "golden" and "five-banded" are in general used indiscriminately. Altho Mr. Doolittle does not say so, he has probably done more than anyone else to disseminate a strain of golden Italians combining beauty with other good qualities.

Wax - Worms Eating Dried Apples.—The report of the Secretary of Agriculture, Western Australia, includes a report from the biologist, R. Helms, says the Australian Bee-Bulletin. "Mr. Helms' report speaks of the increasing number of wax-moths in apiaries where bees are kept in unsuitable boxes. Speaking of the small wax-moth, he says 'It does not entirely depend upon wax-comb for its propagation, which, however, it prefers to anything else. Its larvæ can also develop upon dried fruits and milling refuse. Dried apples are also invaded by these larvæ.' Foul brood is very common in Western Australia. Bee-paralysis is also met with."

To Prevent Bees Gnawing Quilts.—A writer in Gleanings in Bee-Culture says:

"For years past I have used waxed cloths over brood-frames. The bees propolize the spaces between the frames quite liberally, and oftentimes manage to insert a good deal of the stuff between the cloth and the top-bars. Once in a while I remove the cloths and run a hot laundry-iron over them, thus diffusing the propolis over and thru them. Prior to this operation the bees are somewhat disposed to gnaw the cloth, but never after. Now, I have a number of these cloths that have been in use several years. They are as dark or black as any brood-comb I ever saw."

Introducing Queens by Caging Against the Side of a Comb was recommended by Editor Hutchinson. R. A. Lapsley complained in Gleanings in Bee-Culture that the plan had failed with him. Mr. Hutchinson says in the Bee-Keepers' Review that he sent out several hundred queens with instruction for that sort of introduction, and almost without exception the failures were like that of Mr.

Best White **Alfalfa Honey**
In 60-pound Tin Cans.

We have been able to secure a quantity of White Alfalfa Extracted Honey which we offer for the present at these prices, on board cars here in Chicago: Sample by mail, 10 cents; two 60-pound cans, in a box, 95 cents a pound; four or more cans, 9 cents a pound. Cash with order in all cases.

Owing to our limited supply of this fine honey, those desiring it should order promptly. Address,

GEORGE W. YORK & CO. 118 MICHIGAN ST., CHICAGO, ILL.

The Midland Farmer

(SEMI-MONTHLY)

The representative modern Farm Paper of the Central and Southern Mississippi Valley. Page departments to every branch of Farming and Stock-Raising. Plain and Practical—Seasonable and Sensible. Send 25 cents, silver or two-cent stamps, and a list of your neighbors (for free samples), and we will enter your name for 1 year. If you have not received your money's worth at end of year, we will, upon request, continue the paper to you free of cost another year.

Root's Column

Reading for 1900.

This is the time of year when bee-keepers select their reading for another year. The ABC of Bee-Culture will furnish you profitable and interesting reading for a long time. It tells all about the management of the apiary throughout the year, the methods pursued by leading bee-keepers, and the different hives in use. Better send for the book at once. If you wish,

we will send you sample pages.

Sold by all dealers in bee-keepers' supplies, or sent by the publishers for \$1.20, postpaid. We will furnish you Gleanings in Bee-Culture one year with the book for \$1.75, postpaid.

By the way, Gleanings in Bee-Culture has 950 pages in a year, and has averaged this for the past 10 years, yet the price is only \$1.00 a year. If you have not seen a copy lately, send for our December 15th issue which contains the PRIZE PICTURES, as well as the photographs of Editors York and Hutchinson. This contains our annual index which will show you the scope of Gleanings articles during the year. It also contains the index of contributors and the illustrations of the year. That the index might not crowd our reading-matter we give 16 pages extra. In this issue we give an illustration and description of the DANZENBAKER HIVE for 1900.

If you want a copy of this issue you must ask for it at once, as we have only a few to spare.

Clubbing Rates.

AS AN announcement for our subscribers to renew before the expiration of their present subscription, which saves us considerable time, we offer the following rates for Gleanings one year and a year's subscription to any of the following papers at prices mentioned.

For One Dollar Only.

Gleanings and your choice of the following:

- American Agriculturist, with Almanac.
- Orange Judd Farmer, with Almanac.
- N. E. Homestead, with Almanac.
- Northwestern Agriculturist.
- American Poultry Journal.
- Reliable Poultry Journal.
- Agricultural Epitomist.
- Farm and Fireside.
- Poultry Monthly.
- Poultry Keeper.
- Farm Journal.
- Farm Poultry.

For One Dollar and Ten Cents.

Gleanings and your choice of the following:

- Practical Farmer.
- Michigan Farmer.
- Prairie Farmer.
- Ohio Farmer.

- For \$1.25—Gleanings and Rural New Yorker.
- For \$1.30—Gleanings and National Stockman.
- For \$1.50—Gleanings and Cosmopolitan or McClure's Magazine or American Garden.
- For \$2.00—Gleanings and Country Gentleman.
- For \$2.50—Gleanings and Review of Reviews.

New subscribers also are entitled to these rates.

THE A. I. ROOT CO.
MEDINA, OHIO.

Lapsley—the bees dug under and liberated the queen before they were ready to accept her. The trouble was just the one complained of by Mr. Lapsley, sufficiently explicit instructions had not been given, Mr. Hutchinson never thinking that any one would cage the queen against a *new* comb of honey. He says: "The comb selected should be old, tough brood-comb, and filled with just-hatching brood instead of sealed honey. If a few of the cells contain unsealed honey, no harm is done—in fact, it seems to me better." And the bee-keeper must not stir things up by looking in a day or two to see if the queen is "all right."

Grumbling at Low Honey-Prices seems to be as common in Australia as in this country. A writer in the Australian Bee-Bulletin says:

"I can't for the life of me see how prices are going to rise without one-half of the bee-keepers go out of the business. The best thing in connection with the honey-business is the supply-trade, viz., hives and fixings, and queen-rearing. Goodness knows, hives and fixings are cheap enough, but even at the low price they are at it scarcely pays to buy them. I don't know any business more unsatisfactory to dispose of than bees and hives. One simply cannot sell a well-appointed apiary at any price."

Do Porter Escapes Make Bees Bite Cappings?—Editor Hutchinson, in the Bee-Keepers' Review, defends them against the accusations of F. Greiner. Mr. Greiner is right in saying bees will bite the cappings if much smoke is used or if they are greatly alarmed. But Mr. Hutchinson thinks there is no need of that with the escapes. After the flow is over, he chooses the middle of a warm afternoon to put the escapes in place, doing the work gently, and has no trouble. It is just possible that the two gentlemen may find a difference on account of difference in bees. The blacks are more easily frightened so as to gnaw cappings than are Italians.

Gentle Bees That Are Hustlers.—The editor of Gleanings in Bee-Culture intimated that "cross and snappy" bees were likely to be the kind to roll in the honey. Whereupon D. B. Lynch reports a colony of hustlers that are remarkable for their gentle disposition. He says:

"No one has ever been stung by her bees, and the hive has been opened repeatedly in wind (do you know what Dakota wind is?) without smoke or veil. I send you a photo of my little daughter, two years and nine months old, with a frame of them. Notice the bee on her forehead. She knows they will not hurt her. She has often been stung, but not by that colony; and if any one has 'cross and snappy' bees that can beat them hustling, please quote prices. I am open to conviction."

The New York Honey Market.—Mr. Segelken says in the Bee-Keepers' Review and Gleanings in Bee-Culture that he is quoted as saying that the New York market finds no trouble in disposing of 60,000,000 pounds of honey annually. While he admits that New York is the great honey market of the country, yet he says no such amount could be handled in any one year—not by one firm nor by half a dozen. He says he may have said that 6,000,000 pounds was the amount, and this would come nearer to the actual amount sold; but this would include only all domestic honey, not counting the large consignments of foreign honey that come thru that port. All told, he estimates that the New York market handles from 7,000,000 to 8,000,000 pounds of honey annually.—Gleanings in Bee-Culture.

Feeding Substitutes for Pollen.—In most places bees can get pollen from natural sources in spring; but sometimes, and in some places, it is a scarce article, and then, according to G. M. Doolittle, the

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a small quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and bass-wood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal for 1900, with \$1.00. We will also "throw in" the balance of 1899 to such new subscriber. Surely, this is a great offer. We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered this season by an old personal friend of ours, so we know it is all right. But we will have a small supply. When nearly out we will mention it.

ESTABLISH A HOME OF YOUR OWN

Read "The Corn Belt," a handsome monthly paper, beautifully illustrated, containing exact and truthful information about farm lands in the West. Send 25 cents in postage stamps for a year's subscription to THE CORN BELT, 209 Adams St., Chicago.

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00), and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

bee-keeper can get a lot of fun to the square inch by feeding a substitute. He says in the Progressive Bee-Keeper:

"I had such a season once, and the bees and I improved it by my making a shallow box about 10 feet long and 4 feet wide, placing the same in a sheltered sunny nook, and pouring into it some very finely ground 'horse feed' (corn and oats ground together), together with some very fine planer shavings, and about half as much fine wheat flour as there was of the horse feed. A little piece of comb and some scraps of propolis were put on some live coals, and the dish containing both set in the center of the shallow box, with a few drops of honey scattered about over the contents. An hour later that 'sunny nook' was a sight to behold, and one of the most merry, pleasant things I ever was allowed to hear and see. The air was full of dusty white bees just above the box, packing the contents from the box in their pollen-baskets, while twice as many more were rolling about amongst the bits of shavings, oat-hulls, etc., in such a way that no one could look on the sight without having every bit of 'blues' they had ever experienced driven from them. Nothing in the bee-line ever attracted visitors as did this, and the children just went wild with glee and delight while watching the bees 'cut up their antics' in and over that box of feed."

GENERAL ITEMS

First Season Fairly Successful.

The past season was my first in the bee-business, and I think I was fairly successful. I purchased four colonies in 8-frame dovetailed hives, and have increased to nine, which are in fair condition for wintering, and also secured 215 pounds of comb and extracted honey. There was a fair honey-flow from June 15 till July 15, from white clover and basswood, tho but very little late honey. **A. A. FERRIER,**

Ontario, Canada, Dec. 4.

Small Crop But Good Prices.

My report for 1899 is as follows: 22 colonies, spring count, increased to 33, and got about 600 pounds of comb honey. I can't complain, considering the year, which was too cold and wet in the spring. I sold my white honey for 16 and 18 cents, and the dark for 14 cents a pound. Small crop, but got good prices, which generally are about 12 cents for white, and 10 for dark.

H. W. SAVAGE.

Sauk Co., Wis., Dec. 11.

This Winter Can't be the Worst.

A good flight of bees Dec. 10, with mostly mild weather to date, seems to shorten the season so that the winter cannot well be one of the worst ones now. **E. E. HASTY,**

Lucas Co., Ohio, Dec. 12.

Euphorbia—Probably Not New.

A correspondent of the valuable Bee Journal asks information about a species of euphorbia that he thinks secretes a large amount of nectar. It is a little uncertain to which species of Euphorbia Mr. Livingston refers, as the eminent botanist, Dr. Gray, describes 23 species in the United States; while Prof. Wood, in his botany, describes 27 species. Mr. Livingston says the species that furnishes nectar freely has no petals, but the leaves (meaning probably what botanists call a corolla-like involucre) are either entirely or partly colored a bright red. Now, I find only one species of euphorbia described by Dr. Gray that has a colored, leafy involucre; this is named hypericifolia. Dr. Gray says that

this species has the appendages of the involucre entire either large and white, or smaller and sometimes red.

If I am right in supposing that Mr. Livingston's plant is the same as the sort described by Dr. Gray, that has sometimes a colored involucre, the other variety having a white involucre should secrete as much nectar as the red, and doubtless does in Georgia and Florida; but both sorts may secrete no nectar in the Northern States. Indeed, the white variety is quite common in this State, but I have never known the bees to resort to it for stores.

Inference: Not best for bee-keepers to invest much for seed of *E. hypericifolia*.

Cook Co., Ill. D. S. HEFFRON.

No Honey the Past Season.

Most of my bees froze last winter, but I have at present 14 colonies in pretty good shape. There was no honey here the last season.

The American Bee Journal is always a welcome visitor; I drop all the rest till I have read it. **GEORGE W. SHEARER,**
Stark Co., Ohio, Dec. 11.

Promises Well for Next Season.

There was no honey shipt from this place this year. The loss of bees is variously estimated from 35 to 50 percent for this county. I lost 51 out of 184 colonies, mostly from becoming queenless during our long, dry summer, but everything promises well for next year. We are having plenty of rain. **J. A. GERELDS,**
Uvalde Co., Tex., Dec. 9.

Two Good Honey Seasons.

We had a good honey season last year and also this year. I secured 3,200 pounds of comb honey. I put my bees into the cellar Dec. 4, the temperature being 46 degrees till last Friday, and since then it is 50 degrees; but last night the wind changed to the north, and we have rain this morning, but I think it will soon change to snow. **WM. DUESCHER,**
Brown Co., Wis., Dec. 11.

Prospects Good for Next Year.

We are having two spring seasons here in California for 1899. The whole country is rich in verdure, and the weather all that could be asked for in May. No frost yet this winter, and promises are full for a great yield of honey next spring and summer. **A. B. SHEARER,**
San Luis Obispo Co., Calif., Nov. 28.

"Several" Kinds of Euphorbia.

On page 766 is a short letter about "Euphorbia—Is It a New Plant?" The description is not sufficient for anyone to identify the plant mentioned by Mr. Livingston as euphorbia, as it is one out of 600 species, some very common and others confined to tropical regions. Some are very poisonous, and many have a milky juice. Could Mr. Livingston give a fuller description of the plant, or give the specific name?

Two euphorbias grow wild here, and there are several species cultivated in gardens. **THOS. WM. COWAN,**
Monterey Co., Calif., Dec. 4.

Why We Blush—Fair Honey Crop.

MR. EDITOR:—I appreciate your enterprise and backbone in making and keeping the American Bee Journal strictly a bee-keeper's paper, with no *filling* except the kind that fills every reader with information that makes them better calculated to make their profession a success. Those convention talks and papers are all right. Stay with them.

Honey in this locality was a fair crop and of good quality. I bought and shipt east about 25 tons, and the returns were very satisfactory, and the purchasers well

Page & Lyon Mfg. Co.

satisfied with the goods. I have been buying and shipping honey for several years, and in the past I have had trouble to get the producers to put up their goods in marketable condition. They are improving, and I have hopes that the standard will be raised so that every bee-keeper will put up his goods so that the whole case will compare favorably with the row behind the glass, and honesty prevail among packers.
N. J. COOLEY.

Inyo Co., Calif., Nov. 30.

Rain Means Honey in 1900.

We have had 15 to 20 inches of rainfall to date this winter. This means honey in 1900. We have just placed 550 colonies and 200 nuclei in winter quarters—all strong and heavy with honey.

O. P. HYDE & SON,
Williamson Co., Tex., Dec. 11.

A Fair Season.

The season has been fair here. I took from 40 colonies, spring count, 1,300 pounds of comb honey and 1,000 pounds of extracted, with an increase of 36, and 200 extracting-combs built.

JAS. R. CONKLIN,
Cayuga Co., N. Y., Dec. 7.

Wintering Bees in the Cellar.

I think it will be unnecessary to refer to any particular place for the statement that it will not do at all to winter bees in the cellar with bottom-boards on the hives, unless there is a wide, deep entrance, for it is repeated in some form or other so often that it seems out of reason for anyone to doubt it. But I wish to say, in as few words as possible, how I winter my bees, which will show that conditions are not the same everywhere.

My hive-bottoms are all nailed on, and are never taken off. The entrance is one-half inch by the full width of the hive. There is nothing over the bees except a board cover when they are taken into the cellar, and that stuck on tight.

I have wintered my bees in the house-cellar since 1893, and have wintered over 100 colonies the last three winters without the loss of a single colony in all that time, nor have I ever lost a colony in the cellar.

The combs are never damp or moldy, and the bees keep their hives as clean and sweet as in summer, carrying out all dead bees and dropping them on the cellar bottom. I visit them with a light often, with-

out ill effect, and can tell when they are too warm as soon as I enter the cellar, without referring to the thermometer I keep hanging near. I have no desire to dispute the conditions as stated by the writers who say it will not do to winter bees in the cellar with bottoms on the hives unless there is a wide, deep entrance, but just want to call their attention to the fact that in some other places other men may do differently, and do right.

Our bees winter on amber honey, as we have no other here, and I never weighed any that weighed over 12 pounds per gallon, and ours granulates about March after it is gathered. I think you will say that it cannot be the extra quality of the honey that makes the difference, but we think our honey quite good.

If my bees ever die off by the wholesale, I'll promptly let you know. J. B. DANN,
Gage Co., Nebr., Nov. 24.

[With all other conditions at their best, there is no reason why a colony might not winter finely in a cellar with entrance only one-half inch deep in any locality. Again, they might not, and it is well to be on the safe side.—C. C. MILLER.]

Convention Notices.

Michigan.—The annual meeting of the Michigan State Bee-keepers' Association will be held at Thompsonville, Benzie Co., Jan. 1 and 2, 1900. There will be reduced rates on all railroads, and a special rate has been secured at all the hotels there at 75 cents per day. There will be an exhibition of the famous willow-herb honey, also of all the leading supplies used in the apiary, and latest improved implements. At least two, and perhaps three, of the A. I. Root family will be present, and other noted men. Everything indicates the largest meeting held in years. The subjects discust will be those nearest the heart of the bee-keeper, so come prepared to give your views, in exchange for the views of others. It will more than repay you for all the time and expense to attend.
Fremont, Mich. GEO. E. HILTON, Pres.

N. E. Ohio, N. W. Pa.—The Northeastern Ohio and N. W. Pennsylvania Bee-keepers' Association will hold their 19th annual convention at Andover, Ohio, in Chapman's Hall, Jan. 17 and 18, 1900. Boarding rates of \$1.00 per day have been secured for those attending the convention. All bee-keepers invited. Send to the Secretary for programs.

Among the subjects to be discust are the following:
"Spring and Early Summer Management of Bees," by Mrs. C. J. Cornwell; "Is it Desirable to Prevent Swarming?" by O. G. Belden; "Best and Cheapest Method of Producing Comb

Honey," by M. E. Mason; "Full Sheets, or Starters," by C. H. Coon; "Advantages of Producing Extracted Honey," by B. W. Peck; "Co-operation to Improve the Market and Increase the Price of Honey," by Geo. Spittler; "Preparing Bees for Winter," by R. D. Reynolds; "Bees as Pollenizers of the Blossoms," by Ed. Jolly; and "Making Our Association More Useful."
Franklin, Pa. ED JOLLEY, Sec.

Illinois.—The executive committee of the Illinois State Bee-keepers' Association have changed the date of the ninth annual meeting to Dec. 26 and 27, 1899. It is understood that all the railroads will make half rates during the holidays. The State Horticultural Society and the State Teachers' Institute hold their annual meetings at the same time, and all at the State House, so that it will be a great inducement for a good attendance. We expect to have a fine program for the occasion, and a good time, as bee-keepers always do when they get together. Come, everybody!

LATER.—Since the insertion of the previous notice the railroads, thru the Western Passenger Association, have refused to make a single fare rate for the round trip, but made the rate of one fare and a third for the round trip. If any one when purchasing a ticket is refused the one-third rate for the round trip, he must demand a certificate showing that he paid full fare coming, and together with the Horticultural Society we expect to have much more than 100 in attendance, and thereby get the above-named rate.
Bradfordton, Ill. JAS. A. STONE, Sec.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Dec. 12.—We quote best white comb at 15c; an occasional small lot of fancy sells at 16c; off grades of white, 12@14c; ambers, 10@12c. Extracted, 8@9c for fancy white; 7@8c for amber; 6@7c for dark grades.

Receipts are larger and the demand is not as good as it has been; most of the retailers have laid in a supply to carry them over the Christmas time. R. A. BURNETT & Co.

CINCINNATI, Dec. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8 1/2c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 26c. C. H. W. WEBER, Successor to Chas. F. Muth & Son and A. Muth

KANSAS CITY, Dec. 9.—We quote No. 1 white comb, 13 1/2@14c; No. 2, 13@13 1/2c; No. 1 amber, 13@13 1/2c; No. 2, 12@13c. Extracted, white, 7 1/2@8c; amber, 7@7 1/2c; dark, 5 1/2@6c. Beeswax, 26@22c. C. C. CLEMONS & Co.

NEW YORK, Dec. 10.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8 1/2c; light amber, 8c; white clover and basswood, 8c; amber, 7 1/2c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7 1/2c per pound; other grades, as to quality, from 7@7 1/2c gallon. Beeswax quiet at 26@27c. HILDRETH & SEGELKEN.

CLEVELAND, Dec. 1.—Fancy white, 16@17c; No. 1 white, 15@16c; No. 1 amber, 13@14c; No. 2 amber, 12@13c; buckwheat, 9@10c. White extracted, 8@9c. A. B. WILLIAMS & Co.

SAN FRANCISCO, Dec. 6.—White comb, 11 1/2@12 1/2c; amber, 8@10c. Extracted, white, 7 1/2@8c; light amber, 7@7 1/2c; amber, 5@5 1/2c; Beeswax, 26@27c.

Values are being maintained at previous range with stocks light of all descriptions. It is doubtful if five carloads of honey could now be secured in the whole State. Shipments by sea the past week were over 300 cases, the major portion being destined for New York.

BOSTON, Dec. 8.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

There is very little now to report in the line of our honey market. The retail trade are loath to pay the higher prices and are buying in a very small way, still the demand is fully equal to the supply. BLAKE, SCOTT & LEE.

ALBANY, Dec. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6 1/2@7c; dark, 6. Beeswax, 26@28c.

MACDOUGAL & Co. Successors to Chas. McCulloch & Co.

OMAHA, Dec. 11.—The November trade has up to the present not been as good as was expected, and shows a falling off from October. It seems that the somewhat higher prices this fall are affecting the consumptive demand to some extent, still the warm weather yet prevailing in this part of the country may also be partly responsible for it. While trade has been light, prices have been well maintained, nobody being burdened with stock to such an amount as to become oppressive.

Fancy white still going at 14@14 1/2c, and light amber 1 cent less. Extracted, white, 8@8 1/2c. PEYCKE BROS.

DETROIT, Dec. 11.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8 1/2c. Beeswax, 23@24c. M. H. HUNT & SON.

WANTED.—Comb and extracted honey; state price, kind, and quantity.

R. A. BURNETT & CO., 33A 2nd 163 So. Water St., Chicago, Ill.

WANTED. Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery.

C. H. W. WEBER, Successor to Chas. Muth & Son and A. Muth, 40 1/2 214 4th Central Ave., Cincinnati, O.

NOTHING LIKE IT EVER BEFORE WRITTEN

NOT TO BE HAD IN BOOK STORES

NEWS AND GOSSIP OF A NEW BOOK ON THE BIBLE have been current in book and Christian circles everywhere for some months. In its authorship was to be combined the superb talents and literary abilities of three of the greatest lights in the world of religious literature.

The book is about to appear and on its title page in collaboration as authors are found the names of that most popular of all writers, IAN MACLAREN (Rev. John Watson), together with H. M. WHARTON, D.D., the great Evangelist, and J. WILLIAM BUEL, Ph.D., one of the most prominent and popular writers on Biblical subjects. A MASTERPIECE INDEED must be the book which calls to its creation such a combination of unmatched talents. IT IS A MASTERPIECE—and it is good news we bring our readers when we tell them that after the most persistent endeavor and the most industrious and earnest negotiations with the Publishers, this paper is one of a syndicate which has secured the entire first edition for distribution among their subscribers, not as a means of winning profits, but to encourage the people to become regular readers, because of the unusual privileges which are offered regular patrons.

The book is entitled "THE GOLDEN MORNING," and while it was intended to be a \$5.00 book, and has everything about it—authorship, illustrations, paper, printing and binding—to warrant that price, we have, after many objections and refusals, made terms whereby WE ARE IN POSITION TO OFFER IT TO OUR READERS AT A GREAT REDUCTION. It contains nearly 800 pages and over 500 superb illustrations. It is printed with clear type on coated paper, and is bound in beautifully illuminated covers, with gold and colored stamping.

IT IS IN REALITY THE BIBLE IN STORY FORM arranged so as to assure a perfect understanding of THE GREATEST OF ALL BOOKS even by little children. All ambiguous and obscure phrases and descriptions have been put into language which makes them clear as noon-day. The historic events have been arranged in their proper order, and the story is made continuous and of absorbing interest throughout. Poetical description so freely used in the Bible, and the many Fables, have all received analysis and now appear as plainly told tales which need no interpreter or explanation.

Hundreds of artistic and accurate pictures have been used to embellish its pages and fix in the mind of reader or student the scenes so graphically described. No book of a religious nature has ever been so sumptuously illustrated. This feature alone costing an enormous sum of money, as every drawing was made especially for this work.

It will be of highest value to the young, as from a few readings, they will get such an understanding of Bible truths and promises from this book, that it would require years for them to gather through Bible reading or study. Indeed, one of the chief claims of "THE GOLDEN MORNING" to universal popularity, is that the children will learn to reverence and love the Bible and to accept its teachings through reading this charmingly written story.

WE ARE READY TO DISTRIBUTE THIS GRAND BOOK AMONG OUR READERS who should order at once, as our portion of the introductory edition is limited. The prices are as follows, WITH POSTAGE PREPAID:

BOUND IN EXTRA FINE CLOTH, BEAUTIFUL GOLD AND COLORED STAMPING \$2.75
SUPERB HALF MOROCCO, WITH BURNISHED RED EDGES \$3.75

THE BOOK WILL NOT BE ON SALE IN BOOK STORES, AND SHOULD BE ORDERED FROM THE OFFICE OF THIS PUBLICATION. EACH ORDER WILL BE PLACED ON FILE ON ITS ARRIVAL AND FILLED IN THE ORDER RECEIVED. BECAUSE OF THE EXTREMELY NARROW MARGIN OF PROFIT, CASH WILL BE EXPECTED WITH EACH ORDER. SHOULD THE BOOK BE UNSATISFACTORY WHEN RECEIVED AND EXAMINED, IT MAY BE RETURNED AND THE MONEY WILL BE CHEERFULLY REFUNDED.

Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

CONVENTION PROCEEDINGS

Report of the Proceedings of the 30th Annual Convention of the United States Bee-Keepers' Association, Held at Philadelphia, Pa., Sept. 5, 6 and 7, 1899.

BY DR. A. B. MASON, SEC.

[Continued from page 805.]

THIRD DAY—EVENING SESSION.

The evening session was called to order by Pres. Whitcomb, and Dr. Miller sang "Dot Happy Bee-Man," after which a paper was read by Mr. F. Hahman, secretary of the Philadelphia Bee-Keepers' Association, on "Our Pursuit as Viewed by an Amateur."

Those in attendance on the sessions of the convention had become so well acquainted with Mr. Hahman in his untiring efforts to provide for the comfort of the delegates, that when he stepped forward to read his paper, he was greeted with most hearty applause by every one present, to which he, in a humorous way, responded by saying, "I am glad you applauded *before* I read my paper," inferring that no applause would be accorded him at its close.

Mr. Hahman—I wish to state here that I did not write this paper to-day. I wrote it last week, and I want to say that Mr. Selser, in his paper, *did* mention beeswax as a product of the bee, but he pretty nearly forgot it. I was also pleased to hear last evening that away in the time past hives were used. Long before they used glass isinglass was used. The amateur breeds bees for beauty.

Our Pursuit as Viewed by an Amateur.

There is one side of apiculture which has not been exploited in our bee-periodicals to the extent which has obtained in the race for perfection, as viewed by the professional bee-keeper, and yet a great part of our devotees are of the amateur class—men and women who keep bees chiefly for pleasure and study, and only incidentally to produce honey. That this class of bee-keepers view our pursuit somewhat differently from the man in pursuit of dollars and cents must be obvious.

The amateur is not tied down to make his living, either partially or wholly, from the management of his colonies, and follows the fad, if we may so term it, mainly for the pleasure, recreation, instructive study and genuine enjoyment which the keeping of a limited number of colonies affords. It will thus be seen that the keeping of a few colonies of bees offers many inducements to him who looks after them, and, unlike other hobbies, is scarcely ever a drain on his purse, on the contrary it frequently augments the same.

Bee-keeping appeals to the amateur, first, in the study of the insect in a scientific capacity, its anatomy and object and function or natural history. It is superfluous for me to enter into details of a study, which has been so carefully and ably elucidated in Frank Cheshire's great work, but the enjoyment derived by every bee-keeper from the investigation of the marvellous structure of our bee, and the adaptability of all its organs to the uses for which they are intended is a never-ceasing source of enlightenment of the sublime in creation. The entertainments of microscopical observation of our Philadelphia Bee-Keepers' Association during the winter months, I feel safe in saying have been an enjoyment as well as instruction to its members, for there is sufficient zest in the pursuit of this study, in determining the status of a few of the organs of our pets, which, despite the careful observation and investigation of scientists, seem to baffle scrutiny in determining their exact and positive service. Another side-light of the natural history of bees is their unconscious labor in the fertilization of flowers, making a rather pleasant study of their habits in spring and summer time.

Fully as instructive and enjoyable is the study and observation of the interior economy of the hive; perhaps I may add that it is the chief attraction holding the amateur steadfast in the rank of the bee-keeping fraternity. Nowhere has the fascination of this part of bee-keeping been expressed in more beautiful language than in Rev. Lang-

stroth's masterful work—he who was the father of bee-keeping, whose name shall endure for all time.

In viewing bee-keeping from its practical side, there are only a few minor considerations which do not also apply to the professional's view for its betterment.

One of the points which has quite a future, and has not received the thoughtful, fostering care and impetus it deserves, is the production of beeswax. The commercial value of beeswax has been rather overlooked by bee-keepers. The persistency with which this product of the bee has been adulterated in commerce, and the untiring efforts put forth by chemists to find a substitute for it, as used in industrial arts, are conclusive, tho' negative proof of its value. If the same thought and experiment as applied to increasing the production of honey per colony were applied to the production of beeswax, I believe the possibility of managing apiaries for this product alone would result therefrom.

The decadence of the observatory hive is something which the amateurs should rectify. It is strange that this hive should have almost disappeared from our supply manufacturers' catalogs. There ought to be no well-regulated apiary, whether it is a professional's or amateur's, without at least one of these hives. Its very name is prophetic. By its use much knowledge of the habits of bees can be obtained which never can be acquired in any other way, notably the action of the bees in comb-building and the elaboration of wax.

The breeding of queens has reached a point where the requirements of professional and amateur seem to diverge hereafter. It now appears that the professional bee-keeper will want queens strictly for business only; the keen competition in producing honey for the market has made this an imperative necessity, and a correct one also. Not so with the amateur; he wants bees for beauty, a few pounds of honey more or less does not dim his vision—he wants fine-looking bees. We all know that the beautiful five-banded golden Italians, and the gentle and handsome albino variety, do not embody what might be called the acme of honey-gatherers, but I think all of my fellow-members have noted, at some of our local gatherings during the summer-time, the pride with which the owner of these handsome bees has exhibited them, and the longing look cast their way by those less fortunate in possessing their equal.

We of the amateur class are with few exceptions fond of bees presenting a beautiful appearance, and the queen-breeder must not lose sight of this fact in catering to the wants of this large class of bee-keepers in the future.

The improvement of our stock is of vital importance, and the improvement attained up to date is truly marvellous, considering pranks which Nature plays on us in the fertilization of queens.

In the breeding of animals and plants man's superior knowledge and skill have wrought wonderful changes in adapting both to his uses and profit. He has, for instance, produced horses for speed, and horses for draft purposes, which differ as widely in appearance as they do in the uses for which they are intended, both kinds having been produced by careful selection of adaptable breeding-stock. In the matter of cattle, numerous breeds have been developed, and as regards fowl, the different strains and varieties are almost too numerous to mention.

In the vegetable kingdom the improvement attained by the horticulturist from the fertilization of flowers and the raising of seedlings, resulting from the skill of his selection of parentage has been truly startling, and vastly surpasses the changes produced in the animal kingdom. A comparison between our cultivated flowers, fruits and vegetables, with their progenitors, growing in their native habitat, will exhibit changes which are not easy of comprehension, and seem doubtful of veracity to the beholder.

With facts thus accomplished by careful selection and breeding, the possibilities of improving our strains of bees would be a foregone conclusion, provided the apiarist were able to control the mating of queens and the selection of individual drones for that purpose. We are aware how the workers in one colony are not all alike, and the queens produced from one mother do not resemble each other exactly; so do the drones of a colony differ in many essentials, and I believe more so than do the workers. If it were possible to select the breeding-drones, not as a body, but individually, it would not be long before we would have bees with longer tongues, bees with greater wing-power, and bees better adapted to withstand atmospheric changes of temperature. This problem ought to be, must be, and in all probability will be, solved at some future date. With the present uncertain practice of selecting the drones of one colony as a body, in the hope that they will constitute the stock for

breeding purposes, it appears to me that the drones are judged too much by the merits of their sister workers. It must be borne in mind that the drones of a colony seem to be the product of a previous generation, and the characteristics of the colony from which the queen has sprung is the one to look to for a guide of the collective value of her drones. How many queen-breeders keep any such record? I think but few. In the rapid interchange of breeding-mothers thru the mails, what guide have we of her parentage, or, rather, of her fraternal comparisons, of which her drones appear to be a reproduction? I can safely answer, not much to boast of; we work considerably in the dark; but we must seek the light, and endeavor to improve our understanding, and progress will crown our efforts whether we are professional or amateur bee-keepers.

F. HAHMAN.

Mr. Selser—I would like to say that this question of controlling bees and improving the stock is an important one. I was struck when going to Mr. Hahman's house to see black bees, and when I left the neighborhood I made up my mind that he owned about all the yellow bees in the neighborhood; I askt him how he managed it with so many black bees around him. He said he kept a large number of drones.

Dr. Mason—What methods have been proposed by which we can control this matter of fertilization? In the Bee-Keepers' Review there appears a method that seems to be very practical. Confine the drones you want to use, and the queens you want fertilized, and put them in the cellar until the time other drones are thru flying for the day; then let free the drones and queens you have confined, and the probabilities are that the queens will be fertilized by the confined drones.

Mr. Stone—Why not use drone-traps?

Dr. Mason—They don't confine the neighbor's drones.

Mr. Stone—I want to mention another matter, and perhaps I can get a little light. In our State (Ill.) we need a foul-brood law, and I believe it was the amateur bee-keepers that defeated it. We greatly need such a law.

J. H. M. Cook—The amateur bee-keeper, in the sense of this paper, is one who studies the habits and work of the bee; but the careless farmer who keeps a few bees is the one who does the damage.

President-elect E. R. Root gave notice that the next annual meeting of the Association will be held in Chicago, the time of the meeting to be given later, but will be during the G. A. R. encampment.

Mr. Secor, chairman of the Committee on Resolutions, presented the report of the committee as follows:

REPORT OF THE COMMITTEE ON RESOLUTIONS.

WHEREAS, It has pleased the Ruler of the Universe to remove one of our loved and honored members from his field of earthly activity; therefore, be it

Resolved, That in the death of our brother, Miles Morton, of New York, the industry of bee-keeping has sustained the loss of an active and capable honey-producer, a master mechanic, and an honest man of high character.

Resolved, That the labors of George W. York, editor of the American Bee Journal, in the prosecutions for the adulteration of honey, are appreciated by this Association, and we bespeak for his journal the hearty support of all bee-keepers, as a partial remuneration for his disinterested services.

Resolved, That the thanks of this Association are due, and they are hereby heartily tendered to the Philadelphia Bee-Keepers' Association for the uniform kindness and courtesy shown to our members during this convention, and especially for the unceasing activity and kindness of W. A. Selser and F. Hahman, of the Entertainment Committee, in looking after our comfort while in this beautiful city. The Philadelphia Bee-Keepers' Association has confirmed and emphasized the fact that we are in the "City of Brotherly Love."

The services of Mrs. Wilber W. Miller, who has so ably read the papers before this convention, are hereby acknowledged. She has given this Association great pleasure, and we desire to express our thanks.

Miss Hohlrein, of St. Louis, who has so skillfully played the accompaniments to the songs sung, is entitled to grateful acknowledgements.

EUGENE SECOR,
E. R. ROOT,
W. Z. HUTCHINSON, } Committee.

The resolutions were approved by a rising vote.

Mr. Abbott—I most heartily agree with the committee about the entertainment. I have never attended a convention anywhere where I felt so much at home as I have here. Every effort has been put forth for our comfort, and those efforts have proved a success.

Dr. Mason—I wish to emphasize the resolutions. I don't think we can speak too highly of our entertainers. I thought those fellows in the "wild and woolly West" did everything up in grand style, and they most certainly did well in providing for the comfort of the delegates who attended the conventions at Lincoln and Omaha, but if there were not any of them here, I should say the Philadelphia bee-keepers had "knocked the socks clean off of them." As Dr. Miller says, each year we can do better.

Pres. Whitcomb—Remembering the two meetings that have been held in Nebraska, I realize how hard Mr. Hahman and others here have worked. I trust that we will all meet again in Chicago in 1900.

The convention then adjourned.

A. B. MASON, Sec.

The Proceedings of the Utah Bee-Keepers' Convention.

REPORTED BY GEO. E. DUDLEY.

The Utah Bee-Keepers' Association met Nov. 24, 1899, in Salt Lake City, with Pres. E. S. Lovesy in the chair, and Geo. E. Dudley was appointed secretary *pro tem*.

The first subject for consideration was the loss of bees during summer, by the bees crawling about outside of the hives and dying in great numbers. Mr. Cornwall reported that he had this trouble among his bees every year, beginning about the middle of August, and lasting about six weeks. It seemed to be the judgment of several present that the smoke from the smelters caused this trouble. So far no remedy had been found that would relieve this difficulty.

The wintering of bees was next discussed. Mr. Lovesy gave several illustrations in proof that bees must have ventilation in winter. If they are sealed down air-tight they would sweat, the bees and combs be damp, the air would become foul, and this would make the bees too weak to seek their stores; they would thus die of starvation. He said he found this to be the case every spring, while bees that had sufficient ventilation usually lived.

Foul and pickled brood was next considered. Mr. Hone gave his experience with pickled brood. He used salt and sulphur as a remedy, and cured the trouble. He thinks the dairy business is injuring the bee-industry by feeding the sweet clover and other flowering plants off the land.

Mr. Hone also related some of his experience with foul brood. He spoke of cleaning the hives thoroly, and not giving them the chance to become foul.

Mr. Schach said that he had cured pickled brood by a free use of dry slackt lime and salt, scattering all thru the hive. He said it cleansed and purified the bees, and kept down disease.

Mr. Lovesy, in giving his experience with foul brood, opened up a new field for investigation. He said that in localities where foul or pickled brood was prevalent he had examined many apparently healthy colonies, with no sign of any disease about them other than sometimes a few or more cells of the brood showed a wrong or back presentation. He said that later they turned out either foul or pickled brood if left alone. He gave it as his opinion that the larva were already diseased, and in their agency turned over with their heads in the bottom of the cells, and died in that position, as it was impossible for them to hatch out. He said it was easier to treat the disease at this stage than to wait for further development.

Secretary Fagg said that twice this season he had caught the bees killing their old queen, and concluded that the subject of requeening could be left to the bees.

Mr. Bangitor said that last year he had 35 colonies, increased to 82, and took off 10,000 pounds of honey; but this year from the 82 colonies he got only 700 pounds, while some of them died thru the winter and spring. He believed that many of his bees were poisoned by spraying with Paris-green.

Mr. Hone said a weak colony having a queen could be placed over a strong colony and they would not kill each other, but would live and build up by the upper colony receiving heat from the lower.

All present favored the sale of comb honey by the case instead of by weight.

In his address delivered at the meeting, Pres. Lovejoy said:

"As far as the bee-industry is concerned, this has been a peculiar season, and in many parts of the State it has been anything but a profitable one for the bee-keepers; while in some localities the winter losses were not so severe, the wet, cold, backward spring was very destructive, some bee-keepers suffering heavily, and even those bees that were left were so reduced that while many of them built up, and some of them did very well, others lingered along, and some of them died off thru the summer. But it is pleasant to note that in the south and southeast parts of the State, as also in parts of the southwest, the conditions have been more favorable. Some bee-keepers in those localities inform me that their bees never did as well before as they have this year. I have received reports from different parts of the State, ranging all the way from nothing up to 2s2½ pounds per colony, spring count. While a few have reported a scant honey-flow, many have reported that it has been abundant: thus the fault, as a rule, where success was not obtained, seems to have been climatic conditions, and a lack of strong colonies to collect the flow of honey: the principal cause of these conditions being the unusually severe weather in the month of May in the north, and in some portions of the central part of the State. As a rule, the honey crop is excellent in quality, and the prices are fair, with a good demand.

"I have received many complaints in regard to the fruit-spraying. We had hoped that this question was settled for all time, but, like Banquo's ghost, it bobs up again. There are more wild theories advanced in regard to this matter than there are about any other subject. It would be very gratifying if some plan could be adopted to remedy this matter effectually."

CONTRIBUTED ARTICLES

No. 2.—A Colony of Bees—How to Make the Most Out of It.

BY "OLD GRIMES."

I WILL suppose in this instance that the bee-keeper desires to make as much advancement as possible and to keep abreast of the times. When I was a boy and lived at Old Grimes' homestead, the box-hive was used exclusively, and I have no doubt my grandfather, Old Grimes, could have written a volume upon the benefits of said hive over the earlier straw-skep or the hollow-log.

But the Grimes family have now moved out more into the center of our Nation, and the progress of bee-culture has moved along also to a more improved management, and tho, like my grandfather, I am called Old Grimes, I have not learned all there is about bee-keeping—there is enough left to the business to keep the younger generation busy improving for a long time.

In article No. 1 the reader has learned that to get the most out of a bee-hive it must be of good material and well made, and the same terms can be applied to the bees that occupy it.

My long experience teaches me that to have a colony do its very best in 1900 I must commence to prepare it in this year 1899. A first requisite is a vigorous race of bees, and for an all-purpose bee I would recommend the Italian. The Carniolan race has within the past few years gained many advocates, but the test of further time will be necessary to allow it to equal the Italian, if it ever does.

In order to get the most out of a colony there is a general consensus in the fraternity of bee-keepers that the prosperity of the colony is centered in the queen; from my own, and the experience of my ancestors, that is all very true, but before the advent of queen-breeding the drone held an equal if not a superior place in the eyes of the apiarist. And why not? In the rearing of a superior race of horses the selection is in the male line, the same in the rearing of all other animals, the same in poultry and other feathered tribes. But in bee-culture the breeding from a superior strain of males is a more difficult problem,

and the energies of the breeder are centered upon the easier problem surrounding the queen.

Not only should queens be reared from colonies showing marked desirable traits, but they should be mated to drones not kin, and showing desirable traits. Isolation is so necessary in these cases that the queen-breeder, if he does not altogether ignore the drone factor, relegates it to the background. The future queen-breeder, or the breeder who wishes to compete for the prize of a hundred-dollar queen, must give more attention to the drone, and I guarantee that those colonies of bees that have made phenomenal records were made so from a chance combination of desirable traits. The bee-keeper who desires to get the most from his colony should continually bear in mind that he should leave nothing to chance.

In order to rear good queens I have no further advice than to refer the reader to the books bearing upon that subject, and I regret I cannot refer to a treatise upon drone-rearing, for in the Grimes family it is held in equal importance, and it seems that the only point neglected in this age of progress is the mating of queen and drone thru continued selection and isolation.

Having a good strain of bees, the next requisite for their welfare is a generous master. As a rule, a colony of bees that have been robbed by a penurious owner until they have barely enough stores to last them until spring, will not amount to much unless conditions are exceptionally favorable. The wintering of bees in our cold climate is far from a certainty, and the problem still vexes a great majority of the fraternity. The Grimes family have settled several points in this line to their own satisfaction, and one of the chiefest is an abundance—yes, a superabundance—of good honey for wintering.

Another factor is a cellar of even temperature; and a cellar in porous soil is better than one in clay or hardpan; the latter can be made healthful by digging it deep, and filling in a foot or more of the bottom with stones and providing ample drainage. In order to winter successfully every time, give the bees plenty of ventilation under the brood-chamber, and ample space for all dead bees to drop free from the combs. A rim at least two inches in depth, with several ventilating holes in it covered with wirecloth, should be placed between the bottom-board and brood-chamber for this purpose.

There should be no upward ventilation; loose covers, mats, quilts and cushions have been the cause of the death of more bees than any other cause in wintering, and to hold the heat more effectually in the hive, an even-fitting honey-board should be used, and over this a telescope cover.

The hive-covers of the day are for the most part cheap and flimsy, and the flimsiest of all are those made of many pieces. A cover that merely rests upon the top of the hive with nothing to hold it in position except as the bees glue it, is not worthy the name of cover, and by some is rightly termed a "lid." The long and the short of it is that a cover covers, and a lid does not cover. A lid may answer when the weather is warm and the colony strong, for they are in a condition to close quickly the openings if broken, but in cool weather, or when a super is added, or when a colony is in medium or weak condition, a lid is always loose, and the vitality of the colony in the form of heat is constantly wasting.

The old adage in reference to the preservation of health in a person—"Keep the feet warm and the head cool"—should be reversed in the case of a colony of bees. The cover should cover not only during the winter months, but after the bees are put out upon the summer stand it is more necessary that the upward ventilation should be closed. At this time it is with a colony of bees as with a steam engine—if the engineer sends the steam from boiler to engine thru a defective pipe, he will not get much out of his engine. This principle holds good even in cool nights in the height of honey-gathering, and in any climate, and on this account I call for a radical change in cover construction.

A colony of bees that comes out in the spring with a whoop and a hurrah is a source of pleasure to the generous master, and it requires but little attention: this should be given at proper intervals in order to get that old, dark honey, with which the outside combs are filled, manufactured into brood. This is easiest done by uncapping a comb and inserting it in the center of the brood-nest; but please exercise caution here, for more harm than good is oftentimes done. Never interfere thus violently with the broodnest until there are five or six frames in which there is hatching brood. When the brood-chamber is brimful of bees, put on a half-story extracting-super. I prefer these

half-story supers for many reasons. It takes less heat to warm them; bees get to work in them earlier; the increase is gradual and keeps pace with the increase of bees; the bees will not leave them during cool nights—this is especially the case when a cover is used. If there is dark honey gathered from willows or apple-bloom it is stored here, and this, too, can be converted into brood; give the queen unlimited room until clover is in blossom.

I am now ready to try to get the most out of my colony, but as that operation merges so closely into more than one colony, and having occupied much space in getting up to this point, I shall ask the reader to consider the next article, where I will tell how I get the most out of an apiary.

Painted or Unpainted Hives—Which?

BY C. DAVENPORT.

PROBABLY in few if any other pursuits are there so many conflicting opinions held as there are in bee-keeping in the matter of painting hives. There is a great difference of opinion. One of the oldest and most successful bee-keepers in this State, and a man whose opinion I hold in great respect, is Mr. Theilmann, who is a strong advocate of unpainted hives, and claims that they will last as long or longer than painted ones, but my experience has been directly opposite to his. With me, unpainted hives last only a few years before the wood begins to check, warp and decay; while I have some painted hives that have been in use by myself and others for about 20 years, and they are to-day apparently in nearly as good condition as when new; and last season I had to discard some unpainted ones that had only been made eight years, both the painted and unpainted ones having been used under the same conditions, and usually set in the same yard.

Strange as it may seem at first thought, I have found that the locality makes a great difference about the durability or length of time a hive will last, and even one mile may make a great difference in this respect. My present location is a very hard one on hives. It is in a sort of opening between two high hills to the south and north; a few rods to the west is a very sandy and much-traveled road, and during dry times, when the wind is in the west, as it is much of the time, dust and sand raised by passing teams floats over the yard and settles on the hives, and if there are any cracks in a hive where it can find lodgment, it greatly hastens decay, for the pine dust from sand is very destructive to lumber, as is sand itself.

Probably all know, for instance, that a fence-post set in sandy ground will not last nearly as long as it will in clay or black soil; besides, this yard being on very low ground, the hives are covered with profuse dews at night, and are subject to the glaring sun during the daytime, which makes it much harder on them than if they were on high ground and shaded.

I have had many unpainted hives in this yard warp badly, twist and check in one season, and I do not believe painted or unpainted hives will last here much more than half as long as they would in other places but a short distance away, where I have had yards located.

No less an authority than Mr. Doolittle, and, I believe, Dr. Miller also, claims that bees do better in unpainted hives, for they say that the moisture generated by the bees can escape thru the pores of unpainted lumber. I have used painted and unpainted hives ever since I have kept bees, and have never been able to observe any difference whatever in this respect. I have some hives all parts of which are well painted, both inside and outside, and bees do just as well in them as in hives not painted at all, so far as I can see. But it is far from my intention to dispute what either of these men say, tho, if I did, I am aware that it would not matter, as the opinion of either one of them is as it should be—of more weight than that of any number like myself would be.

The only way I can account for the difference in our experiences is that there must be less, or a different kind of, propolis gathered in their locality from what there is in mine, for here, after a hive has been in use some time, the inside is smoothed and coated over with propolis of such a character that it will hold water as well as a tin dish, so there is no chance for moisture to escape thru the wood if the hives are not painted.

Unless they are kept well shaded during warm weather, white is the best color to paint hives, for without shade during hot weather, when honey may be yielding freely,

bees will be able to work in white hives, when, on account of the heat, they would be driven out of unpainted or dark painted ones.

Linseed oil, white lead and zinc make a good white paint. It is expensive, tho, and is far from being as durable as some of the cheaper kinds of paints, but there is not, so far as I know, anything besides white lead that will give a pure white color.

A great saving can be made, however, by using and first painting hives well with linseed oil and any of the mineral ochres. These are of different colors, but the color does not, I think, matter, as I believe they are all the same thing; but my actual experience has been with what is known to the trade as "red ochre." This can be procured at nearly all places where paint is sold. It is very cheap, and makes a much better and more durable body mixt with linseed oil than white lead and zinc does, and is not, after it is dry, at all offensive to bees.

The painted hives I spoke of as being used 20 years, were painted with this kind of paint, and the paint itself is on most of them in good condition yet, and I believe this paint preserves the wood much better than white lead does. After hives are well painted with this kind of paint that is thoroly dried, they can be painted with white lead and changed to a snow-white color with but small expense comparatively, all cracks, as well the pores of the wood, being filled with the cheaper paint, it takes but a small amount to cover them again. The white paint adheres well to this ochre paint; better, in fact, I believe, than it does to the wood itself. I think that it was 11 years ago that on some of these red hives I painted large numbers with white paint that can still be read rods away.

To obtain the best results with white lead, whether it is used alone or in connection with this ochre paint, I have found that it pays to mix some zinc with it. When the lead alone is used it will last but a short time before it begins to "chalk," as painters say; that is, it flakes and rubs off like whitewash does.

I have heard it said that if lumber were saturated or soaked in a strong solution of lime water it would last much longer. Three years ago I slacked some fresh lime in a barrel, and after the solution had settled I dipt off the clear liquid and soaked a few new unpainted hives in it. While time has not been sufficient to prove whether the lumber will last much longer, I found that hives so treated were not offensive to bees, and I have never observed any moth-worms incrusting on the under side of these bottom-boards, as I have many times found on both painted and unpainted ones.

Southern Minnesota.

Bees and Their Feathered Foes.

BY H. L. JONES.

EDITOR YORK:—On page 450, Prof. Cook mentions that he would like to know how birds manage the stings when they kill worker-bees. I enclose a clipping showing how some of them manage here. I would like Prof. Cook's comments thereon, as it seems almost incredible that birds can be stung thus with impunity. H. L. JONES, Queensland, Australia.

[The clipping referred to by Mr. Jones is an article written by himself and published in the May, 1899, issue of the Australian Bee-Bulletin, reading as follows:—EDITOR.]

In writing on this subject, I do so as much from a desire to draw information from others, as to throw any new light on the subject myself. We have undoubtedly a good deal yet to learn in this direction. In looking up the writings of various authors in other countries, I find that a large number of different kinds of birds are included in the list of "Enemies of Bees," but as I may have something further to say about this later on, I will confine myself in this article only to birds that have come under my own observation.

The rapacious little martins were the first to introduce themselves to my notice as having a partiality for a bee-diet, and after them came along the magpie—yes, our common, innocent-looking magpie. In 1889, I first observed these at their mischievous tricks, and they came in numbers, too, selected a hive apiece, and gobbled up the bees as if to the manner born. Sometimes they caught the bees on the wing, but in most cases snapt them up as they alighted at the entrance. They carried on in this despicable manner for more than a month, but certainly didn't have it all their

own way, as in the meantime their numbers grew beautifully less—thanks to a reliable shot-gun.

The green oriole has, however, the honor of being the greatest gourmand in this line that I have yet encountered, and its capacity for stowing away bees and stings is simply marvellous. To secure its prey, it sometimes settles on a hive and catches the bees as they fly home; at other times it darts from some convenient perch and takes the bee on the wing; but its most favorite plan is to locate itself in a fruit-tree and either snatch up a bee as it alights on a blossom, or as it flies from flower to flower. In one of these little friends that I shot and made a post-mortem examination upon, I found 15 stings in the stomach, sticking into the lining of it, just like pins in a pin-cushion, some of them being very firmly implanted and imbedded almost up to the head. Another bird had no fewer than 27 stings imbedded in its alimentary canal, and also one sting with its poison-sac attached sticking loosely in its throat at the base of the tongue. I sent on the head and stomach of one of these birds to Mr. H. Tryon, our Government Entomologist, and herewith append his report:

"The bird from which the head was derived that you submitted for examination on July 28, is an example of the green oriole (*Oriolus viridis*), a not uncommon denizen of Brisbane district, especially during the winter months. The portion of its alimentary canal, that you also left for inspection, contained, as you surmised, numerous bee-stings (seven of these were identified by me) that had partly penetrated and were still fixt in its mucous and muscular wall. There also occurred upon the inner lining of the viscus, and upon the bird's tongue also, several hairs that had been derived from the body of a bee. The special features presented by these hairs and stings, when considered together, yielded undoubted evidence that they were derived from honey-bees upon which the bird had fed. The green oriole is well known as being one of those birds that are both frugivorous and insectivorous. It feeds upon figs, mulberries, loquats, various berries, and upon insects generally. I am not aware that it has ever been previously noted, that it includes the honey-bee in its dietary."

Does it not seem an extraordinary thing that birds should be endowed with an immunity from the poison of a bee-sting, when one sting has been known to be sufficient to cause the death of a human being? Some writers, however, maintain that birds eat only drones, others that they extract the sting first, or else swallow the heads only, but these are certainly mistaken, as I have proved times out of number.

In regard to the martins, altho they have paid repeated visits to my apiaries, they have never caused much loss, as on account of a very accommodating habit they possess of perching together in a row, their destruction is easily accomplished. The magpies, however, are among our most valuable insectivorous birds, and I therefore always put up with a good deal from them before resorting to violent measures, in fact it is now several years since I destroyed one, but the gluttonous little oriole is inexorably outlawed and therefore shot on sight, every time.

In conclusion I will mention that I have looked up scores of works, right back as far as 1691, and while most of them accuse certain birds of eating bees, not one writer seems to have made the discovery that the stings may be swallowed with impunity, and may even pierce the walls of the stomach and yet to all appearance have no injurious effect upon the bird.

H. L. JONES.

A General Report for the Season of 1899.

BY J. S. HARTZELL.

ONE year ago I wrote an article for the excellent American Bee Journal and the fraternity of bee-keepers—a report of the product of honey from my apiary and my experience with the Golden system of managing bees for the production of comb honey. Now that the season of 1899 has closed, and with its closing I can but record in large type, FAILURE, I am in no way fitted to make up an account relative to any plan for the production of honey.

The spring of 1899 opened apparently favorable, bees building up rapidly, and were in prime condition for gathering nectar from all sources from which we expect surplus honey stored in sections in this part of country. Poplar, white clover, basswood, sumac and buckwheat all appeared in prime condition, but failed to yield the sweets desired. I do not think I ever witness as dense growth, or as much bloom on white clover in these parts, but all of no avail.

I entered the season with 57 colonies, having lost 3 colo-

nies during winter, and one colony queenless in late fall I doubled up. The product of honey from 57 colonies, spring count, in round numbers was 384 completed sections—an average of not quite 7 sections per colony, and very many light weights, therefore a very meager amount to make comparison of the Golden and general plan; and you know the demoralizing effect on the bee-keeper of having to record failure. Truly, they come too often, in this section of country, at least.

I have been engaged in the business of keeping bees since 1890, and can say truthfully that during the nine years I have not known one that the average yield from spring count of colonies was 50 pounds.

In 1894 I had 39 colonies, spring count, and the yield for that season was 1,500 pounds, which was the best I ever had, taking number of colonies into account, and the product was very superior in quality to any produced before or since. That season one colony produced 112 completed sections of honey, and the colony on scales, during basswood bloom, gained in one day nine pounds, but that for one day only, proving the best ever known in my experience.

My purpose has been, and is at present, to go out of the bee-keeping business, but thus far I must record failure in this, also, owing to my inability to get away from home last winter to dispose of my equipment. And to my great surprise now, I was induced by a proffer made me, to purchase 19 colonies more only a short time since, and now record in the yard 85 colonies, which I will endeavor to dispose of during the winter; and if failure is to be inscribed in this also, I will certainly emigrate to some more favored locality.

Owing to the meager amount of honey secured, the season now closed will not compare results of the Golden and general plans in its production, but I will say that colonies in Golden hives are much the best supplied with stores for winter, and now I have 52 colonies on the Golden plan.

Last winter was the severest ever known here, the thermometer indicating as low as 26 degrees below zero.

Our friend and critic, Mr. R. L. Taylor, criticized and somewhat doubted my statements concerning the report I made of honey produced by the Golden and general plans in the season of 1898, and as I winter my bees on the summer stands I intend giving my experience with this very vital problem in this and many sections of our country, and would request the worthy critic named to explain, if possible, thru the columns of the American Bee Journal, "the why" of the difference or cause of success and failure.

Of 40 colonies wintered in Golden hives, the loss was none; of 20 colonies wintered on the general plan, the loss was 3. By the general plan I mean hives with empty supers on, and cushions of chaff in same, or colonies in winter-cases packed with chaff, and cushions on top. Will Mr. Taylor state which of the two plans he would consider preferable, from the experience as stated?

I have been noticing lately hints of \$100 for a queen-bee—certainly a very generous offer, but if all the qualities stated are embodied in said queen, the amount would in my estimation be a mere pittance for her. However, here is an excellent opportunity for some of our noted queen-breeders to undertake to win the prize (if such it could be called)—I mean the \$100. The queen I fully recognize would be a great prize.

Now, when the queen spoken of is produced, I will take it upon myself to add \$100 more for her, conditionally—if all queens reared from the celebrated one mentioned produce bees that are equally good in disposition and gathering honey.

My experience has proven to me beyond doubt, that there is as much difference in queens and their progeny, altho reared from the same mother-queen, as there is in a family of children from the same parents. No two are of the same temperament or energy, and no two will show equally in prosperity with the same surroundings or in the same locality. Careful observation has impressed this indelibly on my mind, and I will freely pay a handsome bonus to any one engaged in keeping bees, say of ten or more colonies, where each colony stores an equal amount of honey. This being unknown and impossible, can we reasonably expect the much-talkt of queen to be brought into existence? Once produced, she would certainly be worthy a palace or crown—yes, both. And if I could by any means be informed in regard to time and place, I would certainly attend the ceremonies, and, if necessary, pay an admittance fee.

In conclusion, I will say that last winter's losses of bees to bee-keepers in these parts varied from 3 to 100 percent,

the easy, don't care, go-as-you-please bee-keepers suffering the severest punishment for their carelessness. Experience is said to be a good teacher, but whilst this is true it is rather expensive at times. Another maxim is, "Whatever is worth doing is worth doing well." The latter is most applicable to bee-keepers, especially now. Those who have neglected preparing their bees for the winter's storms should make haste and use the greatest care possible.

Somerset Co., Pa., Nov. 20.

Packing, Grading and Marketing Honey.

BY N. J. COOLEY.

(Read before the Inyo County Bee-Keepers' Association,
of California.)

THERE has been much discussion on packing honey, occasioned by an article by Mr. Doolittle, in *Gleanings in Bee-Culture*, in 1898, in which he upheld that it was not dishonest to face cases with white honey and put inferior or dark honey in the body of the case, when sent to commission houses. He was "roasted" on all sides for his views, and letters were sent to commission houses thruout the country by the *American Bee Journal* asking their views. The unanimous verdict was that the bee-keeper got the worst of the deal in every instance when the goods were examined and sold on their merits. Mr. York summed up the whole proposition in these words:

"To face comb honey for market is wrong every time and everywhere."

The question for us to consider is what constitutes "facing." S. T. Fish & Co. instructed me, in repacking honey, to put none but honey of a certain grade in a case, but in putting sections next the glass to put the best and most perfect side out. I believe that facing to that extent is justified and desirable. Peycke Bros. condemn the practice of some producers, of putting good honey on the face but insisting upon slipping in a few imperfectly filled sections, thus placing the whole shipment under suspicion. Producers who put up their goods in this manner not only injure their own reputation but that of every producer in their vicinity.

A traveling-man a few days ago told me that on a visit to Bishop the past fall he was shown some beautiful apples by a rancher who had them for sale. Altho apples were plentiful at his home they were inferior to those exhibited, and thinking that it would be a treat to his family and friends, he ordered a box, and on his arrival home praised in extravagant terms Inyo apples, and the exhibit he would soon make of them. You can perhaps imagine his disgust upon opening the box he had paid a fancy price for, with freight added, to find all but the top layer hardly fit for hog-feed. That box might have sold 50 others had it been honestly packed, but under the circumstances it may head off many a prospective purchaser.

Hotel keepers at Hawthorne told me they bought their eggs at Omaha because they were better and fresher than those from Inyo.

If we ever expect to obtain a ready and regular market for our products we must stop selling cider-apples, rotten eggs and refuse honey as first-class goods. When people place their coin, confidence and consignments in our hands, they have reason to expect an honest deal, and if they fail to get it they will look elsewhere in making their purchases.

In buying honey last fall I was compelled to insist on some honey being repacked and graded, and to reject some altogether, because of inferior honey being put in that should have been kept for home use and extraction; and still, in one car, upon arrival at destination, there were over 300 cases leaky, mostly caused by defective sections.

Last year there was a shortage in many localities and buyers were not very particular, and the fact of Eastern parties sending their coin here and buying the honey at our doors was accountable in a measure to the short crop in the East. I, as their buyer, tried to impress upon the people here the importance of sending only first-class goods, and thus gain a reputation that would be of benefit to us in the future. One of our business men, who doubted the possibility of making arrangements for a cash sale of our honey, when the deal was consummated said, "It's a godsend to our people, but they don't know it."

I have some letters from Peycke Bros. in answer to letters written them by me, asking their opinion as to cases, grading, shipping, different varieties of sections, prices, etc., which I think will be of interest to you all, and perhaps will enable you more fully to understand their

wants and needs the coming season if you desire to sell to them.

[These letters are too lengthy for publication, but from them the following is taken: "In regard to the quality of honey, on the whole we find it much better than we have had from there in previous years. Still, there is quite a good deal of room for improvement, particularly in the proper grading. As long as your people insist on putting even a few sections of inferior honey in the No. 1 cases, they will always be regarded with suspicion, and they will never be able to make a good, outright sale... Another season your people will find that they will have to send their honey into market on its merits, and it will behoove them to be very particular in their grading."]

In conclusion, I will add that I believe it pays to clean carefully all honey intended for market; carefully grade and pack in 24-pound section-cases, with wrapping-paper over and under the honey in the cases. Don't use old newspapers. The ink blackens the wood and gives the sections a dirty appearance. Don't put in sections not well filled; the extractor is a good place for them. Don't put in sections unless well fastened to at least three sides and fully capped over. Don't put in honey you would refuse to buy if offered to you over the counter; and, finally, don't nail down the cover with spikes— $\frac{3}{4}$ -inch brads are large enough.

Endeavor to get the reputation that some honey producers in Utah have, of whom a certain commission firm speaks as follows:

"We do not even have to bother about inspecting with them. They know just what we want and know that they will get their money just as soon as their bill of lading gets into our possession. We have shipped five carloads of comb honey from one point this season without having to go near there, and they are the prettiest goods put up anywhere in the United States."

What would be the worth of a reputation like that to the bee-keepers of Owens Valley? It would mean a sure market every season for all the first-class goods we could produce.

There is no fault with the locality. We can produce as fine honey as any place on earth. The trouble lies wholly in the manipulation and the methods adopted in cleaning, grading and packing for market. Let us strive for the reputation, and guard it jealously when obtained.

Inyo Co., Calif., Jan. 25, 1899.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

"**The Hum of the Bees in the Apple-Tree Bloom**" is the name of the new bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the *American Bee Journal* at \$1.00.

Please send us Names of Bee-Keepers who do not now get the *American Bee Journal*, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

VOL. 39. DECEMBER 28, 1899. NO. 52.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound.

The Happiest New Year ever known we wish to every reader of the American Bee Journal. May it also be the best year of your life so far.

The Annual Index is a special feature of this number of the American Bee Journal. It will be found very valuable for reference to all who have been careful enough to preserve the numbers as they have come to hand each week during the year. What a variety of subjects have been referred to in just one short year! Truly, the bee is a marvellous creature.

The Thirty-Ninth Volume of the American Bee Journal is completed with this number—nearly two score years have past since it was started by Samuel Wagner, and published in Philadelphia, Pa. A good many changes have occurred since then. Perhaps there are not more than ten of its regular readers who were keeping bees at that time and began then to read it. Nearly all of its old-time readers and contributors have joined the "silent majority," and we of the younger generation are left to carry on the work.

Talking on Bees to School Children.—In The Ruralist for October we find the following endorsement from Mr. J. O. Grimsley, the editor of the department of "Bees and Honey" in that paper:

Commenting on Editor York's "talk about bees" before the public school, the Progressive Bee-Keeper says: "Would it not be a good idea for all of us to follow Mr.

York's plan, and see if we cannot have at least one lecture a year on bees, delivered to the children of our public school?"

Happy thought: it would certainly be an excellent plan which would, if the lectures were by well-informed, practical apiarists, lead to much good, not only to beedom, but to fruit and vegetable growers as well. Passing thru the fields and along the paths around the farm we see a bee working busily from flower to flower. What is it? Like Poe's raven, it is just a bee—nothing more. It is gathering its daily bread—nothing more. Thus goes the soliloquy of the common, everyday passer-by, who has no knowledge of the great work the humble little insect is doing for humanity.

It, with its thousands of co-workers, is laying up in a most attractive form, the most delicious of all sweets, and the purest that man can get. It, with its co-workers, is doing a grand work in the transmission of pollen from one flower to another, thus insuring a development of the fruit or vegetable crop. It, with its co-workers, and the colonies at home, furnishes one of the most interesting subjects for study that the enquiring minds can grasp. Yet it is a bee, only this, and nothing more. Like the sands of the seashore, it is only one among a countless number that is doing a great work while we sit idly by, under the shade of a spreading fruit-tree, wondering why the honey-bee was "made with a sting," and why "it is so ill," never stopping to think—always calling it "high-tempered," when in fact the human family is a thousand times more irritable. It is a bee, nothing more.

But let's all work to the standard, as set by Mr. York, and see to it that each public school gets a lecture on bee-keeping. The students will be benefitted, the county will reap its share, and beedom will be a rich gleaner.

Bee-Paper Publishers as Honey-Buyers.—In the Progressive Bee-Keeper for December, we find the following from F. L. Thompson:

"It is well to remember that the publishers of nearly all the principal bee-papers are also honey-buyers. If they know of sales at good prices that are likely to affect their own interests if generally known, they are NOT GOING TO TELL. It would not be business. No one can expect it of them."

We cannot understand why Mr. Thompson should have written that, unless he judges the publishers of bee-papers from what he knows of himself. But we are glad to be able to say that we are pretty well acquainted with the bee-paper publishers who handle honey, and know that they would not act as Mr. Thompson suggests he would if in their place, namely, *not tell if any honey sales were made at good prices*. We want to say for ourselves that such an insinuation is as untrue as it is unkind. We never have knowingly allowed our own personal interests to interfere with giving everything in the columns of this journal that any responsible and honest bee-keeper has reported to us concerning sales of honey. Certainly, we do not publish everything we know, for if we did, there would be some awful howling, and from just such people as write paragraphs like the above quotation.

So long as we pay the right price to the honey-producer, and he is satisfied, we are not going to worry about what anybody says when talking just to hear himself talk.

A Correction.—Editor Leahy says in the last issue of his paper that we "misrepresented the 'Higginsville' beehive cover" when speaking editorially of bee-supplies for 1900, on page 760. We certainly were not aware that we were misrepresenting anything in the least, and hereby apologize for an unintentional error. We do not wish to do a single individual, or even an apiarian fixture or implement, an injustice, and always feel like expressing our thanks when any one calls our attention to it, if he thinks we have published anything that is not borne out by the facts.

"Honey Calendar" in place of the Almanac—See p. 807.

A GOOD WATCH

for only **\$3.50**

Free for 8 New Subscribers

The watch offered here is a splendid time-keeper, and warranted to give excellent satisfaction. It is an open-face, stem wind and stem set, NEW YORK STANDARD MOVEMENT, in a silverine case with screw front and back, and of good weight, thus making a perfect, dust-proof watch.

We offer this watch, prepaid, for only \$3.50; or we club it with the Bee Journal for one year—both for \$4; or we will send it FREE as a premium for only 8 NEW subscribers to the Bee Journal for a year—with \$8.00. This is indeed a bargain. The watch would make a fine gift.

GEORGE W. YORK & CO,

Marshfield Manufacturing Company,

Please mention the Bee Journal when writing.

MARSHFIELD, WISCONSIN.

The Novelty Pocket-Knife

(A heavier and stronger knife than the one we offered heretofore.)

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the Subscriber.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the Novelty is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the Novelties, your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be apprised of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife. We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal with \$3.00, and we will also send to each new name a copy of the Premium Edition of the book, BEES AND HONEY. We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

Convention Notices.

New York.—The annual meeting of the New York State Association of Bee-Keepers' Societies will be held in the parlors of the Kirkwood, at Geneva, N. Y., Jan. 10, 1900, at 11 o'clock a.m. All bee-keepers' societies in the State are hereby notified and requested to send delegates. An urgent invitation to attend is also extended to everybody interested in apiculture.
Chapinville, N. Y. W. F. MARKS, Pres.

N. E. Ohio, N. W. Pa. The Northeastern Ohio and N. W. Pennsylvania Bee-Keepers' Association will hold their 19th annual convention at Andover, Ohio, in Chapman's Hall, Jan. 17 and 18, 1900. Boarding rates of \$1.00 per day have been secured for those attending the convention. All bee-keepers invited. Send to the Secretary for programs.
Franklin, Pa. Ed JOLLEY, Sec.

Michigan. The annual meeting of the Michigan State Bee-Keepers' Association will be held at Thompsonville, Benzie Co., Jan. 1 and 2, 1900. There will be reduced rates on all railroads, and a special rate has been secured at all the hotels—there at 75 cents per day. There will be an exhibition of the famous willow-herb honey, also of all the leading supplies used in the apiary, and latest improved implements. At least two, and perhaps three, of the A. I. Root family will be present, and other noted men. Everything indicates the largest meeting held in years. The subjects discussed will be those nearest the heart of the bee-keeper, so come prepared to give your views, in exchange for the views of others. It will more than repay you for all the time and expense to attend.
Fremont, Mich. GEO. E. HILTON, Pres.

BEE=BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and in a way practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.50.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Chesbire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

York's Honey Almanac is a neat little 24-page pamphlet especially gotten up with a view to creating a demand for honey. A very effective helper in working up a home market for honey. Prices: A sample for a stamp; 25 copies for 40c; 50 for 60c; 100 for \$1.00; 250 for \$2.25; 500 for \$4.00. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Dec. 12.—We quote best white comb at 15c; an occasional small lot of fancy sells at 16c; off grades of white, 12@14c; ambers, 10@12c. Extracted, 8@9c for fancy white; 7@8c for amber; 6@7c for dark grades.

Receipts are larger and the demand is not as good as it has been; most of the retailers have laid in a supply to carry them over the Christmas time. **R. A. BURNETT & Co.**

CINCINNATI, Dec. 7.—There is a good demand for all kinds of extracted honey. White clover and basswood sell at 8@8½c; amber and Southern, 6@7c, according to quality and package. Fancy comb honey in no-drip shipping-cases sells at 15@16c; darker grades hard to sell at any price. Beeswax, 20c. **C. H. W. WEBER,** Successor to Chas. F. Muth & Son and A. Muth

KANSAS CITY, Dec. 9.—We quote No. 1 white comb, 13½@14c; No. 2, 13@13½c; No. 1 amber, 13@13½c; No. 2, 12@13c. Extracted, white, 7½@8c; amber, 7@7½c; dark, 5½@6c. Beeswax, 20@22c. **C. C. CLEMONS & Co.**

NEW YORK, Dec. 10.—Demand is very good for all grades of comb honey. Receipts are somewhat light and not up to former years. We quote:

Fancy white, 15 cents; No. 1, white, 13@14c; amber, 11@12c; and buckwheat, 9@11c, as to quality. Extracted remains firm at following prices: California white, 8½c; light amber, 8c; white clover and basswood, 8c; amber, 7½c. Very little trade for extracted buckwheat as yet. Southern, fancy, 7½c per pound; other grades, as to quality, from 7@7½c gallon. Beeswax quiet at 26@27c. **HILDRETH & SEGELKEN.**

CLEVELAND, Dec. 1.—Fancy white, 16@17c; No. 1 white, 15@16c; No. 1 amber, 13@14c; No. 2 amber, 12@13c; buckwheat, 9@10c. White extracted, 8@9c. **A. B. WILLIAMS & Co.**

BOSTON, Dec. 8.—We quote as follows: Fancy white, 16c; A No. 1, 15c; No. 1, 13@14c; buckwheat will not sell in this city. Extracted, light amber, 7@8c.

There is very little now to report in the line of our honey market. The retail trade are loath to pay the higher prices and are buying in a very small way, still the demand is fully equal to the supply. **BLAKE, SCOTT & LEE.**

ALBANY, Dec. 10.—We quote: Fancy white comb, 15c; No. 1 white, 13@14c; mixt, 11@13c; buckwheat, 10@11c. Extracted, white, 8@9c; mixt, 6½@7c; dark, 6. Beeswax, 26@28c.

MACDOUGAL & Co. Successors to Chas. McCulloch & Co.

OMAHA, Dec. 11.—The November trade has up to the present not been as good as was expected, and shows a falling off from October. It seems that the somewhat higher prices this fall are affecting the consumptive demand to some extent, still the warm weather yet prevailing in this part of the country may also be partly responsible for it. While trade has been light, prices have been well maintained, nobody being burdened with stock to such an amount as to become oppressive.

Fancy white still going at 14@14½c, and light amber 1 cent less. Extracted, white, 8@8½c. **PEYCKE BROS.**

DETROIT, Dec. 11.—Fancy white, 15@16c; No. 1, white, 14@15c; dark grades, 10@12c. Demand good and supply light. No extracted in market. White would sell for 8@8½c. Beeswax, 23@24c. **M. H. HUNT & SON.**

WANTED.—Comb and extracted honey; state price, kind, and quantity. **R. A. BURNETT & CO.,** 33A 2nd 163 So. Water St., Chicago, Ill.

WANTED.—Extracted honey all kinds; mail sample and price expected delivered at Cincinnati. I pay spot cash on delivery. **C. H. W. WEBER,** Successor to Chas. Muth & Son and A. Muth, 40Atf 2146-48 Central Ave., Cincinnati, O.
